Marx and the Millennium

Through an investigation of the fate of Marx's doctrine, two interrelated sets of questions may be examined. The first relates to the problem of the specificity of the postcolonial world and the problems of simply 'applying' theory born in the west to conditions so very different. The second set has to do with the ways in which Marxism's canonisation itself led to the destruction of the emancipatory potential – both in its theory and in the organisational forms mediating its practice. 33

Putting a Price on Fertilisers

The Hanumantha Rao Committee's recommendations on pricing of fertilisers were rejected by the industry on the ground that a uniform pricing policy could not be applied to an industry so heterogeneous. Taking into consideration some of the arguments of the industry it is possible to work out a modified formula following the long-range marginal costing principle. 57

Pages from the Past

"It is impudence to believe that our venture will close the gap between administrative knowledge and public ignorance or apathy. But our main attitude will be governed by our faith in the function of knowledge in the resolution of crisis and by our conviction that common men and women in India are more than a bundle of reflexes like Pavlov's dogs." 8

From the very first issue *The Economic Weekly* became a duality. Comments often cheeky on economic and political developments filled the first half and the second half was taken over by the academic crowd. This unusual coexistence of the mundane with the highly abstract created the ambiance of an unstable equilibrium which threatened to break down any moment. It did not, and half a century has elapsed. 10

Who's to Revive Urdu?

What is the point of constantly stressing that the Urdu-speaking community and the Muslim community are virtually one and the same? The defence of the rights of Muslims and the promotion of Urdu are not the concern of Muslims alone. 44

Gender Politics

To set a new agenda for gender politics, there is need to engage with social forces of caste and patriarchy in a much more explicit manner. 24

Uneven Gains

The Kyoto protocol will allow international trade in permits for emission of greenhouse gases. Will this really act as an incentive, or will it only benefit developed countries? 17

Flashpoints

Caste clashes in Tamil Nadu have acquired simultaneously communal overtones indicating the emergence of a new configuration of politics

Citizens and Government

Given the non-transparency of governmental agencies, the judiciary remains the only recourse to citizens to compel these agencies to function responsibly. A study of environmental litigation in Calcutta. 49

Unrealistic Scheme

The concept of student loans for higher education is based on unrealistic assumptions, especially that strong links exist between education and employment in the labour markets in the developing countries. 19

Louis Dumont

His work on India will stand as a monument against the bogey of Orientalism created and published by scholars who are unable to resist the temptations of popular acclaim. 14

More Than a Foray

It is logical in the context of stated American policy to read the recent air-strikes against Iraq as an elem[illegible] of a broader strategy, rather th[illegible] s a punitive foray.

LETTERS TO EDITOR

50th Anniversary of The *EW* and *EPW*

ON the 50th Anniversary of the first issue of *The Economic Weekly (EW)* it is once again fitting to honour Sachin Chaudhuri, the founder and first editor of that journal, which later became the *Economic and Political Weekly (EPW)*. Sachin was one of the great men of the generation that founded an independent India, and the institutions that contributed to its continued democratic and intellectually open character. As an individual he embodied the wide range of Bengali interests and intellectual achievement. One of his successors, of an equally wide range of intellectual interests, is Amartya Sen, the Nobel Prize winner of this year. It is a fitting, even if an unplanned coincidence, that the award of that prize to Amartya Sen should be in the same year as the 50th anniversary of the first issue of that unique journal.

An excellent short history and appreciation of Sachin Chaudhuri's founding of the journal and its history is presented by Terence Byres in a section of a recent book. (Terence J Byres, 'The Creation of 'The Tribe of Pundits Called Economists': Institutions, Institution Builders and Economic Debate'. The section on Sachin Chaudhuri is on pp 66-73 of this Chapter 2 of the book, *The Indian Economy: Major Debates since Independence*, (ed) Terence J Byres, Delhi, Oxford University Press, 1998.) Byres gives in this names of some of the leading Indian economists, who both encouraged Sachin to found the journal and contributed thereafter to it. There have been many more Indian and foreign economists, visiting or working in India, who contributed to the magazine, first attracted by Sachin Chaudhuri's vision and broad range of interest, and then by Krishna Raj. But the magazine is more than an academic economic journal. It has always presented major contributions by non-economists, including political scientists, anthropologists, sociologists and historians, and has devoted special issues to such matters as the role of women in India.

Another major characteristic of the magazine has been its interest in matters of policy and its efforts to influence actions of policy-makers and the thinking of the intelligent and interested layman. While it is editorially left-wing it has always presented interpretations and policy-suggestions from other points of view. Bhabatosh Datta, writing in 1967 on Sachin Chaudhuri's editorship, points out that the magazine combines "the virtues of topical journalism on the lines of *The Economist* and those of a high grade research journal. It was a still greater achievement to marry this all together in harmoney..." (quoted in Byres, p 69). I agree with him and the comparison, and also with Daniel Thorner, who wrote of the journal as "of world rank" and unique (ibid, p 67). It is indispensable for scholars on India throughout the world.

The *EPW* retains this quality and indispensability under the editorship of Krishna Raj May it continue to do so for the next 50 years to complete its century.

GEORGE ROSEN

Chennai

West Bengal Economy

I READ the special issue of *EPW* on the West Bengal Economy (November 21-28) with great interest. I have the following comments to offer on the issues covered in various papers presented in the issue:

(1) The process of de-industrialisation in West Bengal after independence is sought to be explained partly by factors such as the policy of freight equalisation for coal and steel which led to an erosion of location-based cost advantages enjoyed by units in West Bengal. But explanations given for lack of new investments in West Bengal in upcoming areas of industry are inadequate.

(2) The role of non-institutional credit in the transformation of the agriculture sector in West Bengal is notable. Rather than viewing non-institutional credit as a medium to be replaced by institutional credit it would be a more positive approach if this medium of credit supply to medium and small farmers is nurtured and promoted. One factor that should be noted in this connection is that loans taken by small farmers are generally small in size and the interest burden on them on this account constitutes only a small component of their total costs of operations due to the low capital intensity of their operations. Therefore high interest rates paid by small farmers are not too much of a burden on them as is supposed to be.

(3) The credit-deposit ratio of banks in various states in India is found to be lower in semi-urban areas as compared to rural and urban areas. This is an unhealthy trend because it is in the semi-urban areas that the maximum potential of rapid economic growth exists in India. But public policies discourage flow of credit to semi-urban areas in our country.

P V RAJEEV

New Delhi

Holy Busybodies

WITH friends like the Swadeshi Jagran Manch and the Hindu Jagran Manch, BJP leaders may well conclude ruefully, they need no enemies. For all the Vajpayee government's congenital problems stemming from its fragile Lok Sabha majority and its disparate, indeed chaotic, composition, its severest headaches in economic policy-making have been caused by the activities of the votaries of 'swadeshi' within its own extended family, as was forcefully driven home in the course of its frantic scramble to introduce the bills on patents and the insurance regulatory authority in the final phases of parliament's winter session last month. Around the same time more or less, the Hindu Jagran Manch by its doings in the desperately poor, predominantly tribal Dangs district of Gujarat was making sure that the start of the new year would be nothing if not explosive for prime minister Vajpayee and his BJP colleagues in the government. The situation is not altogether unique, of course. It is not uncommon for political parties with heavy ideological baggage to find themselves, on assuming governmental responsibility, quickly tested and found wanting by ideologically pristine conscience-keepers. A parallel, though not an exact one of course, is the aggressive censoring which Left governments in this or that state have had to put up with in the past at the hands of their ultra-radical cohorts.

By the distressingly awesome scale of communal mayhem this country has got used to, last month's events in Ahwa and elsewhere in the Dangs district must appear mercifully minor. There has been no loss of life, physical injuries have been few and, reflecting the economic condition of the area and the people, destruction of property has been limited. The communal clashes around Suratkal near Mangalore in Karnataka about the same time involving, more typically, Hindus and Muslims have taken a far heavier toll in all these respects. The Vishwa Hindu Parishad and other Hindu organisations as well as some BJP leaders, including the Gujarat chief minister, have alleged that the disturbances in the Dangs district have been 'blown out of proportion'. If this has happened, the Hindu outfits have only themselves to blame. It is they who have been shouting from the roof-tops about the international conspiracy, involving the CIA itself for good measure, which they read into the activities of Christian missionaries in the Dangs and some other tribal areas and the conversions which by most counts do not run to more than some thousands.

It is not, however, the scale of the disturbances which is most material from the standpoint of the state and central governments' functioning. The governments have the unequivocal responsibility to maintain law and order. They also have a duty to ensure that individuals and groups are not deprived of their constitutional right to freedom of faith and worship. In the present instance, in large part no doubt because the situation in the Dangs has become the focus of so much attention, the central government has acted with a measure of alacrity which is not always in evidence in similar circumstances: the prime minister and the home minister have been categorical in their condemnation of the violence directed at the missionaries, the home ministry dispatched a team of officials led by one of its special secretaries to the affected areas and the prime minister himself is to pay a visit to these areas. The Gujarat government, after a brief initial show of petulance, has fallen in step; it has submitted a report on the Dangs situation as demanded by the state governor, the concerned district officials have been transferred and details of the action taken to maintain law and order in terms of arrests made, etc, have been made public.

While it is imperative that the pressure of public opinion on the governments in Delhi and Gandhinagar be sustained, there is the other side of the matter – that situations such as that in the Dangs are also a reflection of social realities which while they are affected to a lesser or greater degree by the political attitudes of the governments of the day have far deeper roots. Controversy surrounding the work of missionaries in different parts of the country is by no means something new. To recall a telling example, in the Dahanu area of Maharashtra some years back it was the Left parties which had had occasion to look askance at their activities and some very similar-sounding formulations about conspiracies hatched in the west were then aired. In the case of the recent Gujarat events newspapers have reported the views of two prominent Gandhian workers of the area who evidently intend to submit a memorandum to the central government stating that the situation in the Dangs was a "reaction to conversions". The suggestion has been made in Gujarat and Maharashtra – where too an ominous 'reconversion rally' was organised the other day in a tribal part of Nashik district by an outfit calling itself Vishal Hindu Sammelan – that legislation should be enacted to regulate conversion as has been done in some other states such as Madhya Pradesh. Whether this will assist the administration in its paramount task of maintaining law and order and contribute to safeguarding the citizens' right to religious freedom from being encroached upon by 'forced conversion' and 'forced reconversion' alike deserves consideration.

SCIENCE CONGRESS

Unscientific Approach

THE recently concluded 86th session of the Indian Science Congress appears to have etched more firmly the lines of division between the pursuit of science and its ethical dimensions. More is the pity. For the current dilemma among scientists is by and large how to integrate ethical norms and considerations with their worldview of scientific endeavour as an inherently progressive one even if it appears, in the interim, harmful.

That the Science Congress chose to focus on biotechnology and bioscience is not surprising. After the green revolution years, bioscience, as applied to agriculture, is once again in focus. All over the world biosciences have come out of stagnation and of playing second fiddle to the physical sciences, essentially because of the new technologies in the field which have opened up new frontiers of knowledge growth and of commercial gain. In the US and in many countries of Europe much for the funding for research in health and agriculture is being sunk into biotechnology. Apart from the $3 billion human genome project - aimed at sequencing the 3 billion base pairs of nucleotides which make up the human genome - other massive projects are underway. One such is reportedly the researching of the genome of a small plant similar to the mustard which is looked upon as the future model for genetic engineering. In UK the department of trade and industry has launched in 1994 a programme under which private businesses have been granted 7.5 million pounds for research in biotechnology. And contrary to public impressions, the biggest funders in biotechnology are government agencies and not the corporations that will eventually stand to gain.

It is in keeping with these trends that the central government is projecting bioscience, and biotechnology especially, as the new thrust area. As the prime minister pointed out while inaugurating the Science Congress, India needed to concentrate on two knowledge-based sciences – information technology and bioscience and biotechnology - and both areas, according to him, afforded multimillion dollar opportunities even as they benefit the people. With the minister for human resource development, Murali Manohar Joshi, announcing a new scheme that would fund on a priority basis research projects identified in 21 thrust areas most of which are in the field of biosciences, it was not extravagant of the secretary to the department of biotechnology to seek Rs 15,000 crore for a 10-year plan of development in the area. The post-green revolution era had to merge with the 'gene revolution' in the coming century, with agricultural universities developing expertise in molecular biology and acting as nodes for co-ordinating other research groups. With this focus, the Congress featured luminaries such as James Watson, the discoverer of the DNA, among others.

Biotechnology has prompted wide-ranging public debate all over the scientific world on crucial ethical and ideological and philosophical issues. As a result, governments and scientific associations have had to take time to examine issues that have conventionally been 'outside' science and evolve guidelines that have undergone several revisions and reviews. These debates have been a prominent feature of the growth of this area of science, as perhaps has not happened in any other area in modern times. It is therefore curious and rather unnerving that there was hardly any serious focus on these issues at the Science Congress. Eminent speakers detailed the successes: Indian Council of Agriculture Research's pest shield for cotton farmers, the International Centre for Genetic Engineering and Biotechnology's breakthrough in identifying and introducing into rice and tobacco plants two key genes which help them to withstand stress, of brinjals and tobacco which could be bred to resist pests, of decaffeinated coffee that retains the 'south Indian' flavour, and so on. Others spoke of the need for accepting that in the era of 'megascience', reasonable IPR regimes are necessary. Many were the pleas for future areas of development: for using embryo transfer technology in cattle to improve productivity and improve cattle quality in terms of both meat and milk to be comparable to 'world standards' and to project the scope of growth in pharmaceuticals using recombinant technologies to produce third generation designer drugs. But Indian scientists working in this area appear to be undisturbed by the issues that have for many scientists posed irreconcilable ethical dilemmas and driven them out of biotechnology.

Not only was there no space for such discussions, but in fact 'green lobbies' advocating cautionary approaches towards biotechnology or opposing it appear to have been singled out as obstacles in the path of the glorious progress of modern science. One would suppose that the Indian Science Congress took shape historically not only to provide a platform for announcing scientific results but as a forum for wide-ranging discussions across disciplines. This would presumably mean that issues that concern scientists and have a bearing on their work should find space in the agenda of the Congress. The 86th Congress, by failing to grapple with the issue and in fact dismissing ethical, environmental and human concerns has failed in its objectives. An opportunity for opening up an informed public debate has been lost. This can only give rise to extreme reactions to developments, instead of promoting reasoned debate. The Congress has also failed to stand by young scientists who, having to perhaps face the dilemma of balancing the excitement of working in a leading edge of the science enterprise with the ethical issues related to the products of such research, are being forced to choose one or the other and whichever way they go it is a loss to scientific growth and development.

MAHARASHTRA

Omissions of Commission

WHILE the Justice J D Gundewar Commission has, as expected, severely indicted the sub-inspector of the state reserve police force, Manohar Kadam, for the wanton firing which resulted in death of 11 dalits at Ramabai Ambedkar Nagar in Mumbai on July 11, 1997, the findings of another commission headed by Justice S S Dani to investigate the death of 114 Gowari tribals in Nagpur on November 23, 1994, leave many questions unanswered. The Dani Commission has not only exonerated the then chief minister Sharad Pawar and his three cabinet colleagues from responsibility for the incident but has found the police lathicharge that day to have been "fully justified as well as adequate" for taking control of a potentially nasty law and order situation. The question then is were the tribals who had assembled in large numbers outside the vidhan sabha that day and had been waiting for over five hours to place their 10-year old grievances before a government representative themselves responsible for the tragedy? By labelling the incident as 'unfortunate' and refraining from identifying the agency or the people responsible for the tragedy, the Dani Commission has failed to discharge its responsibility making a cruel mockery of justice.

The Dani Commission's logic in absolving the government authorities and the police does not stand up to scrutiny. It argues that since the Gowaris were killed as a result of the stampede and not in the lathicharge, the police cannot be blamed for the happening. It completely overlooks the sequence of events which led to the stampede. The facts, as have been well documented, are that the stampede began in fact when the police started to wield their batons after removing the barricades. The gathering had begun, quite expectedly after waiting for long hours, to surge towards the barricades in the hope of meeting a government official who they thought was in an approaching car with the official red-light. In the circumstances, to suggest that the police action was justified and in fact helped to prevent a 'catastrophe' is, to say the least, absurd. By de-contextualising the Gowari deaths from the flow of events, the commission has left many a probable culprit off the hook.

It still remains beyond comprehension why the then chief minister Sharad Pawar

or any of his cabinet colleagues did not deem it necessary to take some time off from the legislature proceedings to attend to the long pending grievances of the tribe. That the then chief minister had no inkling of what was happening outside the precincts of the vidhan sabha is hard to believe, because the norm is for the chief minister to be briefed every morning about the happenings in the state. Moreover, the police deposed before the commission that they had contacted the then CM's personal secretary to explore the possibility of him being available to meet the gathering. By failing to interrogate the personal secretary, the commission stands guilty of not comprehensively probing into the incident. Clearly, the resignation of Madhukarrao Pichad, the then minister of tribal affairs, in the wake of the Gowari tragedy was a token gesture of a beleaguered government which had to face elections in few months. Now even Pichad stands cleared of the charges. By turning a blind eye to the callous indifference shown by those in power to the adivasis' demand and to the ruthless treatment meted out by the police to the victims of the stampede, the commission has failed to deliver justice.

UTTAR PRADESH

Caste War in BJP

WITH a reputation for toughness, it is not surprising that UP chief minister Kalyan Singh has rubbed powerful interest groups within and outside his party the wrong way. The Uttar Pradesh Loktantric Congress (UPLC) and the Jantantric Bahujan Samaj Party (JBSP), the BJP's coalition partners in the state had issued veiled threats of an alternative political formation in the state a few months ago when the special task force (STF) of the state police uncovered links of eight ministers to the slain mafia don Sri Prakash Shukla. Six of these ministers belong to the UPLC and the JBSP. And now by dismissing education minister Ravindra Shukla for mishandling the 'Saraswati vandana' issue, Kalyan Singh has taken on political heavyweights closer to the BJP. Besides providing the rival camp in the state BJP with a rallying point, Kalyan Singh's action has incurred the displeasure of the Sangh parivar.

The Sangh parivar is annoyed for two reasons. First, the minister was removed over an issue which in fact is the brain-child of one of the parivar outfits and the parivar expected the concerned minister to be defended rather than axed in the wake of the controversy over the issue. Second, Kalyan Singh's action came at a time when the parivar was making out a case that the BJP's debacle in the assembly elections in the three north Indian states was a result of its failure to push the hindutva agenda with sufficient vigour. Having had to beat a hasty retreat over Saraswati vandana at the education ministers' conference in Delhi not long ago, the sacking of the UP minister over the same issue amounted to flouting the writ of the Sangh parivar in its own bastion.

With the Sangh parivar thus ruffled, the upper caste lobby within the BJP has reactivated itself. Ever since the murder of Brahmadutt Dwiwedi, Kalyan Singh's main upper caste rival within the party, rivalry between the upper castes and the backwards has been sharp in the UP BJP. Sakshi Maharaj, a BJP MP from Farrukhabad and a caste-fellow of the chief minister recently accused upper caste party leaders of plotting to eliminate him and the chief minister with the help of Om Prakash Shukla, brother of Sri Prakash Shukla. In fact, the STF investigation ordered by Kalyan Singh into politicians' links with Sri Prakash Shukla was aimed more at upper caste leaders within his own party than at the UPLC or the JBSP.

The resounding defeat in the elections to the Vidhan Parishad from the graduates' and teachers' constituencies and the sharp fall in the BJP's vote share in the Agra assembly by-election have provided an impetus to the upper caste BJP leaders' campaign against the chief minister. The sacking of the education minister has been used to bolster their argument that the educated and the upper castes are drifting away from the party. Kalyan Singh's riposte has been to raise the spectre of fresh elections in which backward caste support would be crucial for the BJP.

INDIA-SRI LANKA TIES

Trade Diplomacy

IT would be far-fetched to believe that the recent 'fast track' trade agreement with Sri Lanka would make a dramatic impact on the nature of trade between the two countries, or Sri Lanka's balance of payments for that matter. The significance of the treaty lies in the fact that it is a diplomatic manoeuvre to change the nature of relations between the two countries. For India, it is part of an attempt to transform its image in the region; at the least a confidence-building move that became imperative in the aftermath of the nuclear tests, but in a larger perspective a reflection of the direction taken in SAARC towards creating and sustaining regional markets, partnerships and alliances. And for that credit must go to the political leadership in the two countries.

For, in the days and weeks before the treaty was actually signed, there was considerable opposition, not so much to the idea of a treaty as to the nitty-gritty of its contents. In Sri Lanka although the opposition did not want to appear to be blocking the move, there were misgivings that President Chandrika Kumaratunga in her eagerness to build bridges with India might allow Sri Lanka to be hemmed in with too many restrictions. The anxiety was hardly unreasonable, considering the current imbalance in Sri Lanka's bilateral trade with India. And in India there are doubts whether this country would benefit from such an agreement, or for that matter whether one was needed at all given India's commitment to do away with import restrictions on 2,000 products of export interest to Sri Lanka and other neighbours. Most importantly, would the agreement also lead to Sri Lanka being allowed to import tea in bulk, a long-standing demand from Sri Lanka, and a prospect which is viewed with apprehension by the Indian tea industry?

With the two heads of government keen on signing at least a draft agreement, the treaty took shape, though Sri Lanka had many safeguards written into it. The treaty will cover a large number of products. India has agreed to bring import duty down to zero with respect to some 1,000 items over a span of three years. In return Sri Lanka will eliminate tariffs on 900 Indian goods within eight years. The list of products will be drawn up in the next three months. A number of qualifications have been incorporated in the agreement. Concessions are to be limited to 25 per cent on textiles, an item of interest to India. Some textile items – silk and silk waste, carpets and other textile floor coverings, articles of apparel and clothing accessories – have been placed in a so-called negative list. India is to allow a 50 per cent margin of preference on imports from Sri Lanka except on items in the negative list. Both countries have agreed to give 100 per cent tariff concession on specified items, lists of which are to be drawn up.

One contentious issue was the indigenous value addition clause or the country of origin rule which assumes importance in regard to preferential tariff treatment. Minimum value addition of 35 per cent has been agreed upon, but if the raw material is sourced from either of the two countries minimum value addition need be only 25 per cent. The agreement also provides other safeguards: if any product which is given preferential treatment is imported into either country in such quantities as to "cause or threaten to cause serious injury" to industry in the importing country, that country may suspend the preferential treatment with prior consultation, which too may be dispensed with in critical circumstances. Such withdrawal of preferential treatment is also valid in the event of balance of payments difficulties. Also, both countries are permitted to restrict imports when prices are influenced by unfair trade practices like subsidies or dumping.

Much depends on how these qualifications are interpreted by each country. But given that both countries, for their particular purposes, need to strengthen regional ties, the India-Sri Lanka trade agreement is likely to be projected as a model for the SAARC region.

CURRENT STATISTICS

***EPW* Research Foundation**

The new year has opened with some encouraging news. The Sensex jumped 11 per cent in the first week crossing 3,400 due to FIIs' interest. The annual inflation rate, measure by the WPI, at 5.3 per cent has been the lowest now for 35 weeks. This has followed a sharp fall in prices of primary food articles and manufactured food products. However, annual monetary growth has accelerated to 19.6 per cent. Non-food credit expansion over end-March at 3.6 per cent remains subdued as in last year. Exports fell by 4 per cent, while imports rose by 9.5 per cent during April-November 1998, resulting in a trade deficit of $ 6.7 billion. But foreign currency assets continue to expand and are near $ 27 billion

The Economic Weekly

Vol. 1 No. 1 | 1—JANUARY 1949 | Price: Annas

CONTENTS

We take this opportunity of wishing all our readers friends and supporters a happy and prosperous New Year.

Light Without Heat

THE existence of an independent weekly : deal primarily with economic problems (the country, and then, with the broad p(litical ones in so far as they issue out of the fo mer, is a dour need. At present economic discu sion in India suffers from grievous defects. I' paucity is deplorable. On the eve of Industri Revolution, each nation of the West, led b England, produced enormous literature in th shape of pamphlets and reports on which maste minds built their systems and gave lead. Th impact of a new economic order on India thre up our first batch of economists; and they su ceeded in making their partial but honest an lysis popular on the political platform.

Since then our economic development ha gone ahead; the character of Indo-British rel tion has changed; the second revolution of En land has helped India's industrial growth to th point where it does not compete with England' production of capital goods; capitalism of a ce tain type has come to stay, and yet it has bee starved of the necessary strength and opport

nities to expand; our agriculture, gradually shedding its feudal obligations and subsistence commitments, is well on the way to become a food-industry; our terms of trade, balance of payments, avenues of export are taking new lines making hay of mercantilist doctrines which a defensive political attitude, the anti-aspect of anti-British Imperialism, was bound to foster. That such momentous developments have not been adequately reflected in Indian thought on the subject is an unfortunate but noticeable fact.

The objective situation has fairly ripened but beyond a general awareness, prodded by the high cost of living, nothing of significance has emerged. Even the discussion on Sterling Balances has proceeded more on the basis of political denial of a moral right than on economic grounds. The governmental deal on that count is taken at best to be one of Cameralist arrangement of two administrations, one whose national existence depends upon export of capital goods to buy her primary imports, and the other making a virtue of necessity and resenting it. On the other side, many who are eager to take the next step forward have vague notions of what that one should be. Public control, State management, nationalisation, socialisation, managerial revolution, such words and more are bandied about without responsibility to their connotations and mutual differences. A verbal miasma hangs like a pall over our progressive thought. Wishes are great drives, but economic thinking is surely more than wish-fulfilment.

And yet Indian intellect does not seem to have diminished in the course of our national struggle. True that the accent has been on the transfer of political power. Equally true that our traditional metaphysical angle got the support of a moral view of means to achieve political ends. It may also be held that Gandhiji's understanding of the material-rural core was brushed asidxe by parliamentarianism, leaving the detritus of nostalgic villagism and anarchistic decentralism to a few who called themselves Gandhian economists. May be that our scholars could not work off the unreality they had imbibled in London or Cambridge and would not understand the realities of the evolving situation. Still, it is hard to believe that the paucity of genuine economic discussion is solely traceable to the general features of Indian intellect or to a deterioration in the mental quality of those who presumably possess it. Men and women there still are in the country who can, if given data, think about the country.

Therefore, a more plausible reason, call it an additional reason if you like, seems to be the absence of data. The Government had criminally neglected their collection and analysis. When they did not, the reports were published late, and not easily available. That state of affairs continues in the main. It is an open secret that India's delegates to International Conferences are the least equipped of all. We have no production, no wage, no investment censuses. So when our delegates demand foreign aid or press for favourable terms in a trade pact, they cannot produce figures and lean upon 'Asian' sentiments. Similarly, when our ministers spread the slogan of "Produce or Perish", we are left in blissful ignorance of the extent of production necesasary to bridge the gulf between the present supply and the optimal one, between the level of wages and the level of prices. No wonder that all manner of prejudices rush into this vacuum. One such is the bogey of the spiral; another is the quantitative explanation of inflation; and a third is labour's slow-down. These are examples of positive ignorance, – alas, so useful to vested interest' The partial ones are probably as great in number.

About Government publicity the less said the better. The Government have whatever facts there are in the country, and let us concede, all the best brains to boot; but they are singularly disinterested in the dissemination of information on which the public can build their own opinions. Once a Government begins to mistrust the role of information in the shaping of events, it depends on publicity, that is, on the crystallisation of emotions. Besides, there was a time when this technique worked well. Now that the men who run the Government have earned the country's gratitude by winning independence for it, they have a limited choice of emotions to draw upon. The sense of national unity is one, but it is not enough. To think that it is so, is a contribution to the crisis in confidence. Probably the democratic approach towards the people, that which does not exhaust itself by considering them as legs of dead frogs, to be excited by currents of appeals for unity, sacrifice, trust, patriotism, etc., but takes them as human beings capable of understanding complicated problems in the context of their interests and aspirations, – this approach can resolve the present tension between the Government and the people.

Those who are closely following the proceedings of the Constituent Assembly have noted with regret the initial attitude of mistrust of the people which the lawyer-framers and sponsors of the Constitution have betrayed. As if fundamental rights were a matter for the lawyers; as if ordinary men and women just cannot understand the implications of freedom! It is not a question of Hindi or Hindustani or Urdu. That controversy clouds the issue; wicked men have suggested worse things. The issue is simple; are the people to be treated as intelligent human beings or not?

More serious is the invasion of vested interests in this vacuum between facts and understanding. Nearly all our journals belong to powerful pressure-groups, some of whom run their economic weeklies. They are ably conducted; they are 'subtle', 'dispassionate' and 'detached'; they carry the weight of learning and information. But a close scrutiny reveals their onesidedness. While one presses for an open alliance with the American bloc, without mentioning and explaining the implications of the American Foreign Assistance Act of 1948 (E.C.A.), particularly its sections 112, 115 and 118, another publishes the meaningless statistics of man-days lost by strikes without analysing them or showing their relation to the curve of production, or even their proportion to man-days lost by legally preventible factors, like accidents, lock-outs, play-off and sickness. In short, such weeklies are like the Irishman, always 'agin' the Government; its foreign policy of 'neutrality', its 'half hearted economic policy', and its 'appeasements'. The crisis in confidence is well advertised there; only that confidence is a two-way traffic is hardly suggested.

It is impudence to believe, much less to claim, that our venture will close the gap between data and analysis, between administrative knowledge and public ignorance or apathy. We will try our best to do so. But our main attitude will be governed by our faith in the function of knowledge in the resolution of crisis and by our conviction that common men and women in India are more than a bundle of reflexes like Pavlov's dogs. In this our readers will have the assistance of some of the best men in the country, outside the offices of Government and business firms.

Fifty Years Ago

Ashok Mitra

OF the Chaudhuri brothers, the fourth and youngest, Sankho, the sculptor, was away in Paris. The rest of the brothers were in Mumbai (nee, Bombay). The second brother, Debu, held a comfortable assignment with a multinational company assembling and distributing electronic products. The third brother, Hiten, was a gadfly, with varied business interests: production and distribution of films, export and import of raw as well as semi-processed cotton, presiding over an engineering concern producing small tools and equipment, managing a printing press, and so on. The eldest brother, Sachin, was a *pucca* patriarch. The brothers adored him and were in awe of his scholarship and intellectual powers. He had lived the life of a nomad ever since he disappeared from Dacca in 1927 after faring disappointingly in the master's examination in economics. His performance in the examination was no reflection on his scholastic talent. His friend and classmate A K Das Gupta used to recall Sachin Chaudhuri's countless escapades: he refused to sit for the examination in the year it was due, 1926, and embarked on a Bharat darshan instead and scampered back to Dacca even as the next year's examination schedule was announced. He did not even know the syllabus. So what, sang-froid was sang-froid. When the results were announced, Sachin Chaudhuri, it was seen, had just scraped through. Half-dejected and half-embarrassed, he chose to decamp from Dacca.

Debu and Hiten had meanwhile nestled in Bombay and, after an interval of some months, the senior brother joined their sometimes separate, sometimes joint household. Sachin Chaudhuri simply pottered around. His charm, his wit and the sharpness of his mind drew in no time a flock of friends and advisers, politicians, journalists, social philanthropists, a handful of economists too. Sachin Chaudhuri himself did not take his economics seriously, but others did. D Ghosh, who was at the moment on the economics faculty of the University of Bombay, took the initiative to arrange a university research fellowship for Sachin. The scholarship money came in handy while he would stand rounds of drinks for acolytes in Churchgate restaurants. Economic research otherwise, he had not the least doubt, was not his cup of tea. Sachin Chaudhuri imported the Bengali *adda* into Bombay. He perhaps took a proprietary pride in the fragility of the *adda*. There was no ostensible means of livelihood, for the research fellowship could not obviously be renewed, and in any case the money it offered was small beer. Hiten introduced him to Himansu Rai and Devika Rani. Both were bowled over. Sachin became, of all things, the manager of Bombay Talkies. Whether precisely on account of his appointment, or sheer happenstance, Bombay Talkies soon downed its shutters. Sachin Chaudhuri was a free bird once more, even though the friendship with Devika Rani endured.

At that juncture, Sachin Chaudhuri was a vagabond *par excellence*. The man nonetheless continued to have a fearsome reputation – on account of the clarity of his writing, the range of his scholastic interests and the depth of his political and economic commentaries during exciting sessions in newspaper offices and Apollo Bunder cafes. His links with friends in academia such as A K Das Gupta or B N Ganguli did not snap and they did not ever give up the dream of encouraging him back into serious economics. Sachin Chaudhuri, however, had diverse passions – and circles of friends and acquaintances straddling the spectrum of academia and politics and business would all compete to share an evening's company with him. By now he was known as a confirmed bachelor. His sartorial style – white 'khadi' dhoti and kurta, and an occasional 'chaddar' or shawl – was passport to the most exclusive places and mansions. The horrors of partition could not quite drain away the euphoria of independence, and Sachin Chaudhuri's hero, it goes without saying, was Jawaharlal Nehru. Hiten had a way of sidling into famous households, including the Nehru household. Sankho's wife, Ira, had family links with the Nehrus. Sachin Chaudhuri had occasion to meet Nehru, both before and after independence. But he kept his distance; he was no job or licence seeker.

As the cliche goes, destiny nonetheless was awaiting him. Socio-economic dynamics apart, accidents too play a role in the shaping of history. A few months after independence, the government in New Delhi decided to pick a trade delegation to visit Europe and North America to explore the prospects of expanding the country's foreign trade. Hiten Chaudhury found himself a member of the delegation, which was led by a well known Indian economist who believed in maintaining friendly connections with prominent business families in Delhi, Calcutta Bombay and Madras. Whatever the reasons, Hiten Chaudhury took an immediate dislike of the economist leader of the delegation; he was, in Hiten's view shallow to the core; such men, given their prejudices and preconceived notions would be dangerous presences in any arena. it would be monstrous if such men would have the ear of the nation's leaders and assist them to shape their economic ideas.

Hiten Chaudhury returned with an *idee fixe*. He *knew* the depth of his senior brother's intellect and the range of his scholarship. He must be persuaded to start an economic journal, pronto, to prevent the genre of mischief-doing individuals such as Hiten Chaudhury's delegation leader was capable of. Hiten's enthusiasm bubbled over. He found the New Jack Printing Works (address: Globe Mills Passage, Off Delisle Road) at his disposal he would persuade his closest business partners to set up a joint-stock venture, he had already arranged for office premises for the journal in a by-lane veering off from Apollo Street, he had his very wide contacts in the advertising world, it was now for the senior brother, the patriarch of the family, to give his consent to be editor: after all, filling the pages of the journal with thoughtful, attractive pieces of writing would pose no problem for him he had his academic friends who had stayed loyal to him from his Dacca University days, he had acquaintances within the fold of the university faculties one after another. he could bank upon constant help and support from the research staff of, for instance, the Reserve Bank of India, so what was he hesitating for? All he had to give up was the often-weary-sounding column for the *Evening Standard*. But he had a kingdom to gain.

The reservation Sachin Chaudhuri felt was not difficult to comprehend. He was wedded to his vagabond living, now he was being asked to enter into a commitment, a commitment to be regular and responsible. The fear of entrapment was genuine; at the same time, the allure of grand adventure into the hitherto unexplored terrain of tendering advice on crucial issues to the nation's highest from an independent pulpit could hardly be ignored. The brothers, and friends, hemmed him in, and Sachin Chaudhuri succumbed. *The Economic Weekly* was born.

That event took place exactly 50 years ago. The transformation of *The Economic Weekly* into *Economic and Political Weekly* occurred nearly 17 years later. The *EPW* represents a continuum of what the *EW* hoped and dreamt. This reverie of the circumstances of the latter's birth has

therefore a certain relevance for the present generation of the journal's acolytes. From the very first issue, *The Economic Weekly* became a duality, and that characteristic has not ceased to be over these 50 years. Sachin Chaudhuri's cronies from coffee bars and Dalal Street – journalists, stock tipsters, political workers of different shades and hues, some outright bums – took honorary lease of the first half of every issue of the journal: comments, often cheeky, on current political and economic developments, on fluctuations in share prices, on who was conspiring against whom in New Delhi's South Block or Bombay's Mantralaya, on the reasons a particular block of industrial licences went to industrial house A rather than to industrial house B, and other gossip of similar ilk. The second half of the *Weekly* was taken over, through a gradual process, by the academic crowd from the universities and research institutions. This unusual coexistence of the mundane with the highly abstract created the ambiance of an unstable equilibrium, an equilibrium which threatened to break down any moment. It did not, and half a century has elapsed without much murmur of dissatisfaction from any quarter. Perhaps the only other instance of a weekly publication daring to cram its pages with diagrams and mathematical formula is the *Ekonomist* from the Netherlands, and yet that journal too has not had the temerity to carry nonsense verse and pictorial cartoons as *The Economic Weekly* has done in its various phases. The first instinct of an aspiring social scientist in the subcontinent was to get himself or herself published not in a so-called scholarly journal, but in *The Economic Weekly*. At the same time, parliamentary debates have taken place in the two august houses on the basis of a report or a comment in the *EW* or *EPW*. Ever since Jawaharlal Nehru made it a habit to flaunt a copy of *The Economic Weekly* on his desk, the snob value of the journal has spread and spread, ministers and civil servants have regularly subscribed to the journal while scrupulously ignoring the flurry of advice strewn in its pages.

But, then, Sachin Chaudhuri exuded a magnetic charm. Part of this charm was a Chaudhuri heirloom. Once the journal got floated, with Hiten Chaudhury unobtrusively taking charge of the crass details of management, the crowd flocked either to the *Weekly*'s cramped offices in the Dalal Street neighbourhood or to Sachin Chaudhuri's digs at Churchill Chambers. Old friends, and new ones, foregathered. Within the space of a few months *The Economic Weekly* became a cause. Its editorial notes were idiosyncratic, often naughty, often cocking a snook at the establishmentwallas, but it never strayed away from the moorings of the civilisation Tagore had preached or the formula of tolerance Nehru expiated upon. It was therefore almost inevitable that D P Mukerji from Lucknow would contribute *The Economic Weekly*'s first editorial article, 'Light without Heat', in the inaugural issue, and was followed soon after by A K Das Gupta with his rigorous piece on the theory of black-market prices. One had to wait only a while before Sachin Chaudhuri's retinue of admirers from the world of sociology and anthropology invaded the journal's pages.

To run a weekly journal, though, you needed a team to do the sustained work of deciding on themes to focus, writing, copy editing, proof reading, liaising with the press, keeping channels of communication open with the post office and distribution outlets. A vagabond, a near kindred soul, almost as contemptuous as the editor himself, A Fernandes, soon turned up and was named the office manager. The impressionist style he adopted while taking care of the journal's administrative side matched Sachin Chaudhuri's haphazard modalities of editorial living.

Who kept Sachin company while he used to put the paper together, week after week, in that early phase? There is always a danger that in naming names, memory would play a trick or two and some names would be lost in the melee. Much enthusiasm was imported into the ramparts of the editorial office by the ever-ebullient B V Krishnamurti from the Bombay School of Economics and Sociology. Perhaps Sripad Rangnekar and Ramdas Honavar too were around, unobtrusively helping Sachin Chaudhuri to put together an editorial note on monetary theory or international trade. There was the devoted crowd of young scholars and college teachers who made a beeline for *The Economic Weekly* office once their daily official chores were ended: Hannan Ezekiel, Ravi Hazari, a few others. They contributed rough first drafts of notes, the editor honed them into shape, their gratitude knew no bounds. And how does one forget the Reserve Bank crowd: K S Krishnaswamy, his mind always a haven of maturity and his knowledge of economics mounting guard over the effervescence of quite a few young cubs, K N Raj freshly arrived from Ceylon, where he had done a stint in financial journalism, and his accumulated experience in this area, alongside his fondness for adapting Keynesian prescriptions for tackling emerging Indian situations, contributed to the essential flavour of what *The Economic Weekly* was. Others who were drawn in would include the sprightly Dharma Kumar, bitterly complaining that the editor under-assessed the quality of her economics merely because she had, according to him, 'a pretty head': the gender battle was obviously on that early. Should not one also mention Anand Chandavarkar, Vinoo Bhatt and Deena Khatkhate?

What about the Calcutta crowd though? Sushil Ghose, Sachin Chaudhuri's friend from his down-and-out days, would send in weekly notes on share price movements, and the editor would take meticulous care with Ghose's copy. The second brother, Debu, had several drinking cronies in Calcutta whose flair for writing modish prose was well recognised. One of the early ones to join *The Economic Weekly* stable was Niranjan Majumdar, who innovated the Calcutta Diary for the *Weekly* and, a Kingsley Martin admirer, signed his pieces with the nom-de-plume Flibbertigibbet. Samar Sen, the poet, always a lazy writer, could also be persuaded to contribute, his contributions becoming more regular once he encamped in Moscow. Nirmal Kumar Bose, the Gandhiite sociologist, would chip in now and then with an article, and soon a significant slice of *The Economic Weekly* was captured by M N Srinivas and his disciples.

The Delhi School of Economics was yet to find its feet, but *The Economic Weekly* had succeeded in generating awe inside the superstructure of officialdom. Several young economists and civil servants would contribute anonymous pieces to the Annual and Special Numbers of the journal and, once the issue was out, it became a guessing game amongst the contributors – as well as others – who had written which particular piece. There is also the famous apocrypha concerning the government's chief economist at that time, J J Anjaria. Anjaria, God's good man, was a cautious conservative who would not be hustled into views. A raw recruit in the economic division in the ministry of finance had sent an otiose note to Anjaria suggesting the directions along which the country's monetary policy ought to be forthwith reformulated. Anjaria read the note and nervously shoved it in a bottom drawer of his secretariat table. After waiting a full three months for an opportunity to discuss the contents of the note with Anjaria, the apprentice economist mailed the piece to Sachin Chaudhuri, who promptly printed it as the week's main editorial article. Chintaman Deshmukh, the finance minister, apparently read it with avid interest and wanted to have Anjaria's assessment of it. The entire

economic division was summoned in no time to Anjaria's chamber and long commentaries were despatched from the division to the finance minister's office, here and there endorsing Sachin Chaudhuri's editorial sermon, here and there entering a demure caveat.

Such folklore was the product of the time. *The Economic Weekly* was a forum which accommodated each and every point of view, reflecting the ethos of the immediate post-independence years. Economists at that point of time did not mind coexisting with colleagues who professed faith in a different structure of values. Each and all were welcome to send their musings to *The Economic Weekly*. Sometimes the major editorial pieces contradicted each other. They were bound to, since they were written by persons with altogether contrary approaches to life. This kind of phenomena did not worry Sachin Chaudhuri, nor did they worry the journal's devotees.

The dialectics was elsewhere in arriving at a decision on what shape the journal should take in the future. Sachin Chaudhuri, the instinctive anarchist, was full of distaste for method and orderliness. He refused to submit to accountability. Close friends drew up plans about how *The Economic Weekly* was to be run as a successful financial newspaper, with its uniqueness fully preserved, if only it were organised along sound business principles. The very idea was anathema to Sachin Chaudhuri. He wanted *The Economic Weekly* to remain a small-scale operation, a cottage craft so to say, and always in the maelstrom of a financial crisis. Hiten Chaudhuri had sleepless nights, but the patriarch was unwavering in his determination. So the debate was adjourned – and resumed after some while, for yet another inconclusive adjournment.

That in fact encapsulates the history of *The Economic Weekly* and, subsequently, the *Economic and Political Weekly* in the course of these 50 years.

A footnote to end this rambling semi-reverie. Raj and Romesh Thapar, tremendous friends of the journal in a later period, had not begun to visit Churchill Chambers in the early 50s. Krishna Raj too joined the paper, as an occasional correspondent from New Delhi, only in 1958. He moved to Bombay two years later. Perhaps one of these days he could be persuaded to describe the view from the bridge as he saw it.

COMMENTARY

A Russo-Sino-Indian Strategic Triangle

Signals Missed in India

Tan Chung

In the Russo-Sino-Indian triangular alliance proposed by Russian prime minister Primakov, what is happening now is progress only in Russo-Indian and Russo-Chinese relations without a corresponding advance on the Sino-Indian side. How China and Russia have quickly developed their relations after three decades of bitter quarrel has useful pointers for India-China relations. In this context, there have been some significant cues from China which have not been understood and appreciated in India.

THE Russian prime minister Primakov's proposal for a Russo-Sino-Indian triangular alliance during his India visit in December 1998 has aroused considerable international interest. The proposal is both progressive and reactive. Progressive because it is futuristic, pointing to a future direction which is both feasible and desirable. Reactive in the sense that it came immediately in the wake of 'Desert Fox', out of Russian frustration and resentment against the arrogance of the unipolar power that disregards the sensitivity of the United Nations and the sovereignty of another country. The proposal signifies the urge for a multipolar international system with reliable checks and balances.

The triangular idea is not new. Even at the beginning of this century, Lenin had wished that the peoples of Russia, India, and China unite together to ensure the success of a world revolution against imperialism. Lenin mooted this triangular alliance on the basis of the numerical strength of the three peoples as well as their anti-imperialist potential. This idea of Lenin had an impact on Jawaharlal Nehru. In his article entitled 'Why India Supports China?' dated August 21, 1938, Nehru wrote that the "national freedom movements in India, China" could fight the fascists, adding that "there is Soviet Union which has definitely discarded imperialism". He concluded the article by observing: "In the unity of these forces lies the answer to the fascist challenge" (*Selected Works of Jawaharlal Nehru*, vol 9, pp 209-10).

The world is like a stage, and there are always some countries playing the major roles. In the past, some European powers, particularly Britain, had occupied the central stage for a long time. They were replaced by the US during the entire 20th century. In the 21st century, the US will still be in the central stage while western Europe is emerging as another United States, the United States of Europe. However, the centre of gravity of the world is shifting to the eastern hemisphere which will, somehow, marginalise the importance of united western Europe. Surely, new roles will come to the central stage in the 21st century, particularly the eastern part of the Eurasian continent. The proposed Russo-Sino-Indian triangle is one natural outcome of such a global development.

No one is frightened by the word 'alliance' or 'axis' as we know that their erstwhile versions during the two world wars are a thing of the past. But, combination of forces and collaboration among nations will continue, and there is the possibility of a chain of alliances like the symbol of the Olympic Games with five rings strung together. The Russo-Sino-Indian ring, if formed, would be strung together with other rings. It would neither be anti-US, nor anti-smaller neighbours Judging from the civilisational background of the three countries – particularly India and China – such a triangular alliance would act as a magnet that can attract others to its side.

Though, right now, there is no sign of such an alliance and one will not take place at least in the next two to five years, it is possible that a semblance of an alliance may gradually appear, viz, the three countries not only improve their bilateral relations progressively, but begin to act on the international stage with co-ordination, co-operation and collaboration. There will be two dimensions. On the positive side, closer economic co-operation and trade, increasing trilateral consultations in international fora, and even an engagement in strategic areas, such as trading in sensitive, dual-use technology and materials not prohibited by international

law, etc. On the negative side, there would be an increasing reduction and even elimination of distrust and suspicion, let alone hostility, resolving outstanding disputes, replacing confrontation with the approach of amicable dialogue and negotiation.

Just as 'Desert Fox' was the immediate provocation, if not prime mover, of Primakov's proposal, the continuing arrogance of the unipole and the expansive mood of NATO, if not the new born Euro, etc, would create an exogenous push for the formation of the triangle. This, of course, does not eclipse the essential truth that such an alliance has to be a love marriage, not arranged. It would be different from the triangular affairs in real life where one party's love is another's jealousy or hatred – love should prevail among all the three. What is happenning now is only progress in Russo-Indian and Russo-Chinese love-making without a corresponding advance on the Sino-Indian side. From an architect's viewpoint even this is encouraging since two of the three dimensions of the triangular alliance are already taking place. Only if the India-China dimension arrives will the triangle be completed.

How China and Russia have quickly developed their love affair after three decades of bitter quarrel may point to the possible direction India-China relations can develop. Here, I wish to highlight something in China's recent developments which has not been understood and appreciated in India. Before his visit to India in November 1996, Chinese president Jiang Zemin had already obtained a consensus among the ruling elite that India was extremely important for China in the long run, that the Chinese government should shift from its earlier position of tilting towards Pakistan in its foreign policy *vis-a-vis* South Asia. Two high-level visits took place in the last couple of years. Jiang Zemin's visit to India was followed by that of the sixth highest Chinese leader, Wei Jianxing, who was here in December 1997. When Zhu Rongji became China's new premier in March 1998, he told a PTI correspondent that he would like to learn from A B Vajpayee, meaning he would like to visit India soon. Unfortunately, such signals have not been picked up in India and the Jiang Zemin regime was not given a chance to march in stride in improving relations with India before Pokhran II. If that had happened, the present stalemate in India-China relations would have been averted.

From a long-term point of view, much will depend on how India can enter into China's strategic schema which may be described as three concentric circles. In the innermost circle is China's economic development on which is built the prestige and survival of the Communist Party of China (which is celebrating its golden jubilee in governing the largest nation-state on earth this year). Here I must remind my readers that 20 years ago, Deng Xiapoing, the supremo of China, had effected a 180 degree turn in China's strategic thinking by conceiving that the danger of a world war had receded and China was not threatened by anybody. This drastic reversal in strategic thinking resulted in China's decision to integrate her economy into the mega-circulation of the world – essentially the capitalist world. China will not shift from this top priority (of rapid development of her economy) in her strategic schema because, on the one hand, she has achieved great success, and, on the other hand, she is still having a herculean task in providing 22 per cent of humanity (her own population) with only 6 per cent the world's natural resources.

In the middle circle is China's unfinished task of reunification of the country, and presenting and preserving one strong and stable China in the family of nations. Right now, the Chinese government is patient enough in waiting, hoping to have Taiwan back through a peaceful process. But it also would not tolerate any attempt to secede Taiwan from the mainland.

Finally, in the outer circle lie China's ideological concerns, ie, socialism, solidarity with the third world, maintenance of world peace, and a quest for an equitable and just world order.

India assumes eminent importance in this Chinese strategic schema only in the outer circle right now. India, of course, is important *vis-a-vis* China's unification, and so is Pakistan. Friendship and mutual trust with Pakistan is essential for China to maintain stability in Xinjiang just as it is essential for China to befriend India to maintain stability in Tibet. India's importance to China's economic development, though marginal, has a great potential to increase, waiting for the two countries to discover their mutual complementarity and to identify avenues to build their synergic relations. In the last five years, India-China trade has registered a fast growth rate. If this rate continues there will be a cumulative quantum jump over a period of time. There are increasing forces in both countries to push their mutual trade and economic collaboration to a higher level.

When India enters in a big way into the core of economic development in China's strategic schema, China will spare no effort to strike a strategic partnership with India just as she is doing with the US and Russia. Everything boils down to that. Of course, the love affair cannot be one-sided if, in her own wisdom, India decides to maintain a cool distance with her giant neighbour and past close friend and cultural cousin (in historical times) in the years to come, no shadow of Primakov's proposal will emerge on the horizon. While some may heave a sigh of relief at such a prospect, others may feel pain in the heart. It is for the right-thinking Indian mind to locate and weigh China in India's true national interest without emotion and prejudice.

OBITUARY

Louis Dumont (1911-98)

Andre Beteille

Already by the 1960s Louis Dumont had formulated an ambitious plan for a lifetime of unremitting intellectual effort. The aim was to contrast on the plane of values – rather than of social morphology or social action – societies based on holism and hierarchy with those based on individualism and equality, in short, traditional India and the west.

WHEN Louis Dumont quietly passed away at the age of 87 last November, the world of scholarship lost one of the most remarkable anthropologists of our time. Dumont had a long and productive scholarly life, and his great opus was the result as much of patient and unremitting work as of a fertile and penetrating intelligence. When I was his guest in Paris briefly in 1966, his students and younger colleagues complained that he was an exacting task-master. But the most exacting demands that he made as a scholar were on himself. He had hardly any life outside the world of scholarship.

Although he had earlier published a monograph, *La Tarasque*, on a folk festival in France, his real apprenticeship as an anthropoligist began with his fieldwork among the Pramalai Kallar of Tamil Nadu in 1949-50. The result of the fieldwork was published in a detailed monograph, one of the richest of its kind, in French in 1957. An English translation of it had been commissioned by the University of California Press in the early 1960s, and I asked him in 1966 when it would be available in print He shook his head ruefully, saying that the translation was full of defects, some of which he patiently pointed out to me. In the event the project was abandoned, and his readers in English had to wait for another 20 years for the publication by Oxford University Press in Delhi of *A South Indian Subcaste*. This was a pity because by then his reputation as a theoretician had diverted attention away from his earlier empirical work.

Dumont's reputation as a theoretician was established with the publication of his magisterial work on caste, *Homo hierarchicus*, in French in 1966 and in an English translation in 1970. The ground for the scholarly reception of *Homo hierarchicus* had already been prepared. He had started in 1957, in association with David Pocock who had been his pupil at Oxford, the publication of the influential journal, *Contributions to Indian Sociology*. For nine years he used the pages of the journal to expound patiently and systematically, through reviews, commentaries and original articles, his distinctive approach to the study of Indian society. He had also given a preview of his larger plan in a short work published in 1964 with the title of *La civilisation indienne et nous*.

Through the 1950s and 1960s, Dumont explained methodically and tirelessly that the study of Indian society had important lessons to offer to students of European and other societies. As its subtitle indicated, *La civilisation indienne et nous* was offered as an essay in comparative sociology. He argued that the point of the comparison between India and Europe was not that they were similar but that they were different. He was criticised by many, including myself, for stressing the difference too much, but he always maintained that it was the difference and not the similarity that made the comparison intellectually stimulating.

When Dumont began his scholarly apprenticeship, anthropologists were engaged mainly in the study of simple, small-scale societies. The anthropological study of complex civilisations had barely begun. His own work from the 1960s onward made a substantial contribution to its development. He argued consistently that the real understanding of Indian society lay at the confluence of ethnography and Indology. Detailed ethnographic investigations of tribal and peasant communities were indispensable, but those investigations would lack depth unless they were informed by an understanding of the design of Indian civilisation as revealed by a study of the classical texts.

Already by the 1960s Dumont had formulated an ambitious plan for himself. It was a plan for a lifetime of unremitting intellectual effort. The aim was to contrast on the plane of values – rather than of social morphology or social action – societies based on holism and hierarchy with those based on individualism and equality, in short, traditional India and the west. *Homo hierarchicus*, published in 1966 was followed by *Homo æqualis* in 1977; an English translation of the latter, which appeared simultaneously, was entitled *From Mandeville to Marx*. As I have already indicated, Dumont maintained that the insights he gained from the study of India enriched and deepened his understanding of his own society.

The 1970s saw a gradual but definite shift of Dumont's interest away from India to Europe. In 1966 he not only published his last major work on India but also retired from the editorship of *Contributions to Indian Sociology*. *Homo æqualis* was followed in 1983 by *Essais sur l'individualisme*. The last book, published in 1994, was also a collection of papers with the title of *L'Ideologie allemande*, the same as that of the famous work by Marx and Engels. There was no doubt a conscious irony in the choice of title for, although he had read Marx closely, Dumont was no Marxist.

While he benefited much from a brief period of service at Oxford, where he succeeded M N Srinivas as Lecturer in Indian Sociology, Dumont was distinctively French in his intellectual style no less than in his intellectual concerns. There

are obvious parallels with the work of Levi-Strauss to whom he dedicated an early work on the Kallar, and they had both been pupils of Marcel Mauss at the College de France. But Dumont's own intellectual project owed a great deal also to the inspiration of Alexis de Tocqueville. For, as I have pointed out elsewhere, the contrast between *Homo hierarchicus* and *Homo æqualis* resonates with echoes of the 19th-century master's contrast between aristocratic and democratic societies.

It will be disingenuous for me to pretend in an Obituary that I agree with all the conclusions reached by Dumont in his work, for I have expressed many disagreements with it in print in the course of the last 30 years. But this much can and must be said, that I learnt more from my disagreement with Dumont than from my agreement with many other scholars of lesser intellectual vitality; and this is surely true of countless others.

Dumont's work – and even more his life – has been an example for me in more than one way. When he entered the study of Indian society, many other anthropologists from overseas also began their work on India. Those others, particularly the ones from the US, worked with much larger resources, both of funds and of manpower. Dumont's resources in those respects were paltry as I learnt when I went to lecture at his centre in 1966. He had only a couple of students, a secretary who also became his student, and a small library-cum-seminar room which had to be looked up when the secretary went out for lunch. But even though he worked on a shoestring and virtually single-handed, what he produced has surpassed in its intellectual influence the combined work of all the American anthropologists with their manifold resources. In India, where large funding for research is simply not available, or available only at some cost to the researcher's autonomy and integrity, anthropologists and sociologists have much to learn from Dumont's example.

When Dumont began publishing his works in the 1950s, India occupied a minor place in the researches of European anthropologists. British anthropology, which had then a strong international presence, was dominated by Africanists who allowed the Indianists only a small voice in the profession. This changed in the succeeding decades. Dumont's work could not be ignored by even the mandarins of British anthropology, and it is largely due to the impact of that work that the younger generation of British anthropologists working on India have been able to take their rightful place in the profession.

Like many others of great intellectual power who are devoted single-mindedly to their intellectual task, Dumont was often intolerant and abrasive in his manner. As a scholar, he disdained popular acclaim. But he also had a deep humility in the face of his intellectual task. He viewed the achievements of Indian civilisation not only with respect but also with humility. His work on India will stand as a monument against the bogey of orientalism created and publicised by scholars who are unable to resist the temptations of popular acclaim.

TAMIL NADU

New Caste Equations

J Jeyaranjan
Anandhi S

The new political equation emerging in Tamil Nadu is, thus, informed by two contradictory tendencies. While the dalits' alignment with the Muslims is problematising the Hindutva's agenda of co-opting the dalits as Hindus, the anti-Muslim politics of the backward caste thevars is making available a new territory for Hindu communal mobilisation. The future course of politics in Tamil Nadu may depend critically on which of these trends will assert.

SOUTHERN TAMIL NADU has witnessed yet another bout of clashes between the backward caste thevars and the dalits during the first week of October. The clashes have resulted in 11 deaths (about half of it in police firing), and large-scale looting and arson. Though this is the most recent in a series of clashes in this region between the two, the clash is qualitatively different. For the first time, the caste clashes have acquired simultaneously a communal overtone indicating the emergence of a new configuration of politics in the state.

The immediate pretext for the clash was a conference called during the first week of October by the Thevar Federation led by Shanmugaia Pandian, a known history-sheeter who is emerging as a belligerent leader of the thevars. The specific agenda of the conference was to demand the repeal of anti-untouchability act and the abolition of reservation for the dalits and the tribals. While the agenda of the conference is blatantly anti-dalit, the actual trouble started with the provocative posters and graffiti put up by the thevars which challenged the dalits to an armed confrontation. Depictions of bleeding dalits at the hands of knife- and bomb-wielding thevars pointed to the intention of the conference. The protest against these posters and graffiti by the dalits led to clashes between the two castes in Thirupullani. In the police firing that followed two dalits were killed. The events at Thirupullani had a cascading effect and the dalits resorted to 'road roko' in many parts of the district. Vehicular traffic was considerably disrupted and the thevars who were on their way to the conference were detained and attacked by the dalits.

While the events so far resemble most caste clashes in this region, the counter-attack by the thevars had a new and important dimension. They targeted the Muslims along with the dalits. Specifically, commercial establishments of the Muslims were either looted or torched by the marauding thevars, who got their logistic support in the form of food, liquor and transportation from the thevar bigwigs belonging, it would appear, to the AIADMK. In all, 183 shops were either looted or gutted, and Ramanathapuram town alone 85 shops bore the brunt of such attack. The Ramanathapuram District Chamber of Commerce estimated the financial loss at over Rs 1 crore. The pattern of looting and attack on Muslim shops has a close resemblance to the Coimbatore riots last year that was led by the Hindu communal outfits such as the Hindu Munnani and Hindu Makkal Katchi. Tellingly, the posters of the Thevar Federation carried the symbols of 'Om' and the lotus.

In this context, it is important to note that a month prior to the thevar conference in Ramanathapuram, the dalits represented by the Pudiya Tamilagam (PT) organised a conference against untouchability in the same town. Members of the Tamilnadu Muslim Munnetra Kazhagam (TMMK), a new party which is growing in popularity among the Muslims rivalling the mainstream and rather inactive Muslim League, took an active part in the conference symbolising the newly-emerging solidarity among the dalits and the Muslims in the state. While the PT and the TMMK have jointly campaigned against the notorious Prevention of Terrorist

Activities Bill, the PT continues to take up the issues of minorities such as the rape of nuns in Madhya Pradesh.

Though this alliance between the dalits and the Muslims is not on a firm footing yet and in wrought with difficulties, the BJP and the Hindu Munnani demanded a ban on the PT conference, fearing the consolidation of such an alliance. After all, conversion to Islam by the dalits has a long history in Ramanathapuram district. During the 1930s, a large number of dalits from this area chose Islam as their path to emancipation from their low caste status within Hinduism. Meenakshipuram conversion of the 1980s was the best known instance. Such conversions continue till today.

Alongside this alliance between the dalits and the Muslims, one of the main areas of struggle by PT is to gain for the dalits access to ritual space in Hindu festivals which has so far been denied to them. A recent instance of this is the chariot festival at Kandanthevi where the dalits have demanded the right to draw the chariot for some distance along its course as do the hevars. Though there was a court order upholding the dalit's right to do so, the government, instead of confronting the thevars cancelled the festival itself. Likewise, a demand by the dalits during the Shanbagavalli Amman Temple festival at Kovilpatti led to violent clashes earlier. The politics of the PT, while challenging the Hindu exclusivity of the upper and backward castes, is questioning the location of the dalits within Hinduism.

It would be misleading to view the Thevar Federation's attack on the Muslims, along with the dalits, in the recent clashes at Ramanathapuram as only a response to the politics of the PT. The thevar mobilisation has for long been overlaid with a latent Hindu communalism which is now surfacing. The central icon of thevar mobilisation is the late Muthuramalinga Thevar, a Congressman who became the founder leader of the Forward Bloc in Tamil Nadu. If Muthuramalinga Thevar is often presented as a nationalist who combined patriotism and spiritualism in equal measure in his politics, his spiritualism was distinctly Hindu. While it had all the trappings of folk spirituality of backward castes, it never partook in a critique of brahminism. Instead, Thevar's politics had an anti-Muslim edge. In the 1930s, he was responsible for inciting the Hindus against the Muslims in Abiramam village which led to violence against the Muslims who were prevented from cultivating their lands. The statues of Muthuramalinga Thevar which dot the southern landscape of Tamil Nadu are suffused with this Hinduness; his followers go in pilgrimage to his memorial at Pasumpon village which has been converted into a place of worship and where he is also deified. The pilgrimage is often preceded by a month-long ritual fasting. Thevars also dedicate hens and sheeps to the Muthuramalinga Thevar memorial as if it is yet another Hindu temple.

This process of deification of Muthuramalinga Thevar was given state patronage in 1992 when the AIADMK government under J Jayalalitha decided to celebrate his death/birth anniversary which falls on 31 October, as a state function in Pasumpon village. The activities around the icon of Muthuramalinga Thevar which expanded to an unprecedented scale and acquired a new intensity following the state patronage suited well the AIADMK's politics of bringing the backward castes under the spell of Hindu communalism. In appropriating Muthuramalinga Thevar, who combined in him both a thevar caste identity and a Hindu religious identity, for her politics, Jayalalitha always insisted on and highlighted his so-called spirituality. Though the present DMK government has given up the state function at Pasumpon on Thevar's anniversary, it is a miserably insufficient intervention in reversing the new ideology of combining caste and religion set in motion by the AIADMK.

The new political equation emerging in Tamil Nadu is, thus, informed by two contradictory tendencies. While the dalits' alignment with the Muslims is problematising the Hindutva's agenda of co-opting the dalits as Hindus, the anti-Muslim politics of the backward caste thevars is making available a new territory for Hindu communal mobilisation. The future course of politics in Tamil Nadu may depend critically on which of these trends will assert.

International Trade in Emission of Greenhouse Gases

Costly Bargain for Developing Countries

Deb Kumar Bose

International trade in permits for emission of greenhouse gases as formulated in the Kyoto protocol is not to the advantage of developing countries. The pressure likely to be mounted by the developed countries on the developing countries to accept the proposals should be resisted.

CLOUD is gathering over the debate on the means of abatement of global emissions of greenhouse gas. The Third Conference of Parties (COP-3) to the Framework Convention on Climate Change was held in Kyoto in December 1997, to reach an agreement to limit greenhouse emissions by the participants. There was no unanimity among all the 160 nations participating in the conference The industrialised nations finally agreed to commit themselves to binding targets for reduction of the emission of six greenhouse gases within a specified period. The industrialised countries, signatories to the protocol listed in the Annexure-I, were required to reduce overall greenhouse gases by at least 5 per cent below the level observed in 1990, to be averaged over the period from 2008 to 2012 [Bolin 1998]. The protocol marked a significant advance on the prevailing mindset which disputed the need for positive action to address the problems of climate change.

The developing countries, the non-Annex I parties, however, did not agree to bind themselves into legally enforcible commitments as they did not have the wealth and resources to implement the measures according to the protocol. The group of 77 countries and China subsequently reiterated at the Bonn meeting of the subsidiary bodies on UNFCCC in June 1998 that there must be no new commitments, voluntary or otherwise, imposed on the developing countries. But the Annex-I parties held that the protocol will not be effective without their participation. The US have expressed unwillingness to ratify the protocol unless the developing nations were signatory to it.

The conference considered the modality for implementation of the protocol. The US suggested an ingenious approach to adopt incentive-based method of trading of emission between nations with greenhouse gas emission at different levels. The US maintained that reliance on free market mechanism for emission trading would be the cheapest way to meet the targets. A different view was expressed by a number of participants who advocated imposition of mandatory measures such as energy taxes to restrain the level of emission. Eventually, the proposal for trading of emission was agreed to by the industrialised nations [Jacoby et al 1998].

In emission trading system, if any country could reduce her emission discharge level below the target assigned then the difference could be converted into tradeable permit and sold to another country which might need it to meet the deficit in meeting the targeted level of emission discharge. Under emission trading regime, the country, or even companies, can purchase less expensive emission permits from the countries that may have more permits than they need [Smith and Lambert 1998].

The conference decided to establish a 'clean development mechanism', a fund to which developed Annex-I countries can contribute financially. Developing non-Annex-I countries can benefit from financing of approved project activities which would effect reduction in emission, either by way of improved pollution abatement technologies or by extending sinks, i e, absorbents for pollutants, like afforestation projects. Annex-I countries can then use certified emission reductions from such projects to contribute to their compliance with part of their emission limitation commitment.

Emission reductions achieved through this mechanism can begin in the year 2000 to count toward compliance in the first commitment period (2008-2012). Specifics on how this mechanism will operate will be developed and clarified at the November 1998 conference of the parties.

The principle when applied to international trade, however, raises several issues which have to be addressed carefully. They have particular relevance to the developing countries. We may explain the system of trading permit with an example [Kumar et al 1998].

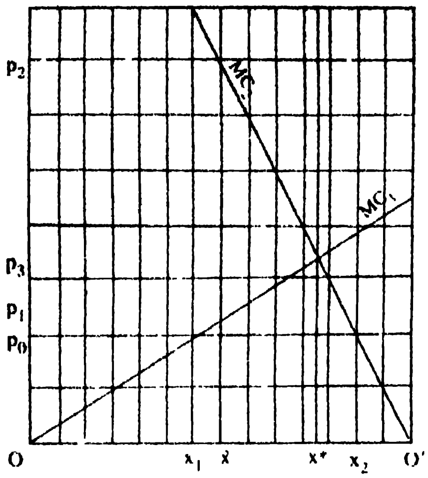
Consider two industries operating emission control technology with different cost structures. The Figure presented here shows the position for the two industries where the amount of emission under control is shown along the horizontal axis and the marginal cost for emission control measured along the vertical axis. However, for convenience of exposition, we measure the volume of emission abated along the x-axis from opposite directions for the two industries. Units of emission controlled by industry 1 is measured from left to rightwards and conversely for industry 2.

Industry 1 having more efficient technology, slope of the marginal cost curve MC_1 is always lower than MC_2 for industry 2. If a uniform emission charge per unit volume of pollutant, P_0, is imposed on both the industries, each will control emission up to the level where their marginal costs equal the emission charge. Industry 1 will operate at the level Ox_1 and industry 2 at the level of $O'x_2$.

If, on the other hand, it is desired to introduce a condition to achieve the same level of abatement of emission on both the industries, they would be obliged to operate their activities at the same level. It is apparent that the cost of operation of pollution control will now be different for the two industries. In the present instance the regulatory authority can impose the condition for reduction of emission by volume ½OO' at $\bar{x}$ for both industries. In the figure both the industries will now be operating at the level $O\bar{x}$. Marginal cost for industry 1 at Op_1 will be less than the cost Op_2 incurred by industry 2.

At this point, the possibility of trade between two parties opens up. If the objective is to reduce emission by the given volume of OO', it could be achieved more economically by re-allocating levels of emission control between the two. Since industry 1 can reduce emission at a cheaper rate than industry 2, the total cost of emission control can be reduced by trading in permits for reduction of emission between the two. Op_2 being larger than Op_1, industry 2 would be gaining if it could trade with industry 1. Industry 1 can reduce its high cost operation for meeting the target level of emission control by purchasing permits from industry 1 for

FIGURE



sharing its burden of emission control up to the level x^* where the cost of emission control is same for both of them. Any move away from the point x^* along the x-axis would be involving higher cost of emission control for industry 2. Industry 1, in its turn, could be gaining by sale of permits up to x^*, where its marginal cost meets the price offered by industry 2.

The advantage of trade of emission discharge permits between industrialistised and underdeveloped economies is not helpful to the developing economies. The quota for emission of CO_2 can be equivalent to holding international assets. It would be possible for the developing economies to convert the permit into capital for investment to accelerate economic development. The line of argument follows that for the comparative advantage in international trade.

It may be seen that the trading in emission permits absolves the developed countries from controlling their own emission by passing on the burden to the developing countries. The latter stands to benefit as long as they continue to emit gases in the air above the average level, while the developing economies are required by virtue of trading emission permits to keep their emission below the average level. Since emission of gases is a function of the level of industrial activities, the trade imposes a cap on it.

The developing countries can increase the capacity to absorb gaseous emission at global level by extending the forest areas on their land. This is the concept of sinks which absorb the greenhouse gases. The developing countries are encouraged to raise the capacity of the sinks. Earning of foreign exchange through the extension of sinks permits, it is argued, import of capital goods to raise industrial capacity of the country.

Extension of forest areas in an agrarian economy has serious policy implications for the pattern of land use. Prospects for earning of foreign exchanges through the extension of forest as suggested under Kyoto protocol would conflict with the objective of export of agricultural products. It may be observed that the afforestation in these countries is already under pressure from extension of agricultural land. With a high man-land ratio in the third world countries, large extension of forest areas is likely to affect the land use pattern adversely.

Sustainable development of forest calls for an active involvement of poor inhabitants in the fringe areas. The villagers in the forest areas collect wood from the trees to sell them in the market to augment their meagre income. It is necessary to create opportunities for them to earn additional income to keep them away from destroying the forest. Foreign exchanges earned from extension of forests under Kyoto protocol have little prospect of reaching the inhabitants in the forest areas.

International trade in permits for emission of greenhosue gases as formulated in the Kyoto protocol does not work out to the advantage of the developing countries. One should be wary of the pressure that is likely to be mounted by the developed countries on the developing countries to accept the proposals for tradeable permits in emission of greenhouse gas.

Student Loans as the Answer to Lack of Resources for Higher Education

Jandhyala B G Tilak

Student loan programmes, as the answer to the problem of lack of public funds for higher education, are based on a questionable philosophy and unrealistic assumptions and are being launched in many developing countries with exaggerated expectations.

IN view of the continuing and rather deepening financial crisis in higher education in many developing countries, many governments plan to rely upon student loan programmes. Student loans are also viewed as an effective antidote to the regressive effects of the 'necessary evil' of steep increases in student fees. Countries which do not have student loan programmes have begun introducing it; and countries that already have it are revitalising it. As a result, very few countries are left where such programmes do not exist. But the student loan programme is based on an inherently dangerous philosophy and unrealistic assumptions and is being launched with exaggerated expectations.

The major expectations of governments with regard to student loan programmes are: (a) huge funds can be mobilised in a short time, with the repayments of loans by the graduates, (b) governments can do away with budgetary allocations for higher education and eventually withdraw from financing higher education and (c) higher education can be made self-financing with the revolving funds.

The student loan programmes are also based on several unrealistic assumptions: (a) demand for higher education will not get adversely affected; (b) poor will have enough access to loans and thereby to higher education; (c) loan amounts can be fully recovered in a reasonable period; and most importantly (d) well developed education credit markets exist in the developing countries. Further, it is also implicitly assumed that strong links exist between education and employment in the labour markets in the developing countries.

The concept of student loans has a strong appeal. (a) Student loans are regarded as 'equitable' as they appear to hold out the promise to the student that 'you can borrow money when you cannot pay for higher education on your own and repay when you can'. That is, access to higher education is not restricted by the inability to pay. (b) Student loans are considered an 'efficient' mechanism of mobilisation of resources, as they have a huge potential of generating the badly needed financial resources from the 'direct beneficiaries' of higher education. (c) Governments in developing countries can save huge public expenditure on higher education and reallocate it in favour of primary education. Other arguments are also made in this context, which are also generally made in case of private financing, such as (d) student loans not only increase access to higher education but also, more importantly, reduce regressive distribution of public resources; (e) they prevent wasteful expenditures as only the needy will take loans; and (f) student loans improve internal efficiency as students with loans would be 'diligent' and more serious about their studies.

The experiences of many developing and developed countries in the past has shown that these are elusive gains. The experience has also shown that there are serious weaknesses associated with the student loans. (a) The experience of countries with regard to recovery of loans is very poor. Several studies of the World Bank and others have shown that the highest rate of recovery was 67 per cent in Barbados, but in many countries it was below 40 per cent, and in some countries the rate of recovery was in fact negative as the real rates of interest were low and even negative. It was estimated that it would take 14 years to recover 50 per cent of the loan amounts in advanced countries such as UK. Cost of administration of loans is very high, if not prohibitive, in some countries. It was also found that launching of student loan programmes in developing countries require huge initial funds (e g, an estimated Rs 3,000 crore in India for higher technical education). Access to loans is guided more by the ability to repay (measured in terms of mortgages, security and collateral arrangements for repayment) than either by educational merit or by economic need of the students. As a result, the loans turn out to be highly regressive, severely restricting the access of the poor to higher education. Student loans could also be a deterrent to women's access to higher education. Huge loan burdens may not necessarily make students more diligent and serious and may in fact contribute to growth in some avoidable social problems including mental stress and suicides. Finally, the psychological factors associated with student loans cannot be ignored. The risk and uncertainty associated with higher education would make people psychologically reluctant to take loans for higher education.

Apart from the practical gains and losses – wherein the latter seem to outweigh the former – the concept of student loans is based on a dangerous philosophy. It is based on the principle that 'he (she) who benefits from higher education must pay'. The principle is based on a very narrow view of the 'beneficiaries' of higher education. It is not only the students, but also their families, the employers, the government, and the society at large who benefit from higher education. The 'externalities' associated with higher education, including 'dynamic' externalities, are acknowledged to be huge.

While private financing of higher education shifts the responsibility from the government and student fees shift the responsibility to households, student loans shift the responsibility entirely to individuals – from parents to children – which might in the long run weaken family bonds. Generally the present generation makes investments for the benefit of future generations. The philosophy of student loans is: let future generations invest now for their own future. The present generation need not take any responsibility of the future.

In short, the philosophy of student loans does not recognise the 'social', 'public' (or quasi-public) and 'merit good' nature of higher education. It treats higher education like any private good and education financing and, say, car financing are treated in the same way. That higher education is an indispensable intellectual social investment is no more regarded valid.

The concept of student loans does not also recognise the uncertainty of the relationship between higher education and jobs. It is wrong to assume that the link between higher education and occupations is either perfect or even strong.

To conclude, the concept of student loans for higher education has inherent weaknesses, as it does not recognise the basic character of higher education, its philosophy is dangerous for society, the gains claimed are elusive, the assumptions behind it unrealistic and, empirically, it has not proved to be a feasible solution to the problem of inadequate resources for higher education nor an antidote to the regressive effects of increases in fees. It may indeed be a deterrent to the growth of higher education.

[Based on the author's presentation at the World Conference on Higher Education, Paris, October 1998.]

'Terror Bombing', Starvation and Mechanical Force

US Prescription for Good Governance

S M Menon

The lessons of the eight years that have passed since the Gulf War are that American designs on Iraq, if they do not collapse at the moment of conception, will, at their moment of fruition, only engulf the entire region in a phase of violent instability. Since the well-being of Israel is a fixed and immutable basis of US policy in the region, the continuing denial of Iraq's sovereignty is a necessary component.

'TERROR BOMBING' is a phrase that was introduced into the vocabulary of warfare by Air Marshal Sir Arthur Harris - a terminological innovation for which the chief of Bombing Command in the Royal Air Force during the second world war is justly famous. Not one to rest content with verbal creativity, Harris endowed the concept with body and substance through a series of destructive incendiary air raids on civilian populations in Germany, culminating in the destruction of Dresden. It was an example that the US emulated with great success in Japan, until closing out the argument in its own way, at Hiroshima and Nagasaki.

Harris had learnt his craft on the training grounds of Britain's colonial possessions. As a young squadron leader in the RAF, he provided a memorable description of an air campaign in Iraq in 1924: "The Arab and Kurd... now know what real bombing means in casualties and damage; they now know that within 45 minutes a full-sized village (*vide* attached photos) can be practically wiped out and a third of its inhabitants killed or injured by four or five machines." To maximise the salutary yield of aerial bombing, said the man who was known in later life as 'Bomber' Harris, it was essential that casualties should be of sufficient scale to produce "a real as opposed to a purely moral effect".

A colleague of Harris in the Iraq operations of the 1920s had a rather more benign account of his experiences: "Air control is a marvellous means of bringing these wild mountain tribes to heel. It is swift, economic and humane, as we always drop warning messages some hours before we start to 'lay eggs' on their villages, so that they can clear out... An eastern mind forgets quickly, and if he is not punished for his misdeeds straight away, he has forgotten all about them, and feels his punishment is not merited if delayed."

The ways of imperialism may have changed over the years, though in their overt and tacit rationalisation, the recent air raids on Iraq show that the more things change, the more they remain the same. By modern canons of political correctness, which even the leaders of the imperial nations have to abide by, it is simply impermissible to stigmatise an entire people in the manner of the air power enthusiasts of the 1920s. The substitute rationale is the demonisation of an individual – first it was Gamal Abdel Nasser of Egypt and then Yasser Arafat of Palestine. Towards the latter part of his career as the embodiment of theological evil, and prior to his domestication by the west, Arafat had to share the limelight with Muammar al-Gadaffi of Libya. And just as Gadaffi was subdued towards the late-1980s, Saddam Hussein of Iraq presented himself to the west as little less than the devil incarnate.

During the war hysteria of November 1997, which was the prelude to the attacks just over a year after, Edward Said, the distinguished Palestinian scholar and political analyst, made an observation that would appear commonplace to a sensitive audience: "a morbid, obsessional fear and hatred of the Arabs has been a constant theme in US foreign policy since World War II." This, in Said's view, fuses with another uniquely American sensibility in determining policy towards the west Asian region: an obsessive morality and a 'puritanical zeal' which decrees "the sternest possible attitude towards anyone deemed to be an unregenerate sinner".

These generalisations are particularly appropriate in the context of the recent air strikes. To recapitulate some of the rhetoric emerging from Washington and London during the recent air strikes, Saddam Hussein had proven himself "a serial breaker of promises", "a threat to his people, the region and the world", and "an enemy of civilisation". The only language he understood was "the language of force" applied in a "devastating and sustained" manner.

The didactic qualities of air power are of course an old theme in imperialism's civilising mission. The pontiff of modern American conservatism, columnist George F Will, put the point well as the first bombs began falling on Baghdad during the Gulf War of 1991. More than a punitive purpose, said Will, the bombs embodied an educational mission, which invited the Arab people to participate in the potential rewards of a civilisation that was capable of such awesome technological prowess. Iraq has now suffered a second visitation of that technological prowess. But the underlying sensibilities were perhaps best expressed by the coarsened American sailor who daubed a 'Happy Ramadan' message on the side of a cruise missile just as it was loaded onto a bomber aircraft. It was a gesture that revealed all the hollowness of official protestations from the US, that the bombing of an Arab nation was being carried out in a manner that was 'sensitive to Islam'.

Consistently, official pronouncements on Iraq in the US have ranked high on moral posturing, though not on subtlety or finesse. From literally a few days of UN Security Council resolution 661, which laid out the terms of the ceasefire in the Gulf, American officials have brazenly put forward their own agenda - to ensure the removal of the Saddam Hussein regime. But the UN would not call for the collective self-effacement of the ruling clique in an autonomous nation – even if it was a nation defeated in the modern world's only 'holy war', which united all permanent members of the Security Council in common cause. The US has hence utilised every ambiguity of phraseology and leveraged its own position as the arbiter of global economic well-being, to introduce fresh conditionalities at every stage into the ceasefire resolution.

A flavour of this American stratagem was conveyed by US secretary of state Madeleine Albright in a lecture at Georgetown University in March 1997. Albright was at pains to affirm that American policy towards Iraq was part of a "broad commitment to protect the security and territory of friends and allies in the Gulf". From the beginning of Operation Desert Storm until the present, said Albright, American policy towards Iraq had been "consistent, principled and grounded in a realistic and hard-won understanding of the nature of the Iraqi regime". And as if these virtues had not been enough, it had also been bolstered by "bipartisan support at home, and general approval in the region". Albright learnt the hard way, while travelling the circuit of Arab capitals in November 1997, that her presumptions were grossly misplaced. There was little approval in the Arab world for the

American policy line towards Iraq, which had long since gone beyond rational calculation into the realm of theological vindictiveness. But that realisation was still far away as Albright unburdened herself of opinions at Georgetown University. An American audience poses few inconvenient questions, which made it easy for Albright to stitch together a perfectly bizarre logical concatenation.

It was far from clear, said she, that an Iraq which complied with all the Security Council demands on weapons of mass destruction would merit the lifting of the punishing regime of trade sanctions it had suffered since 1990. Before these were to be considered, said the American secretary of state, Iraq needed to "prove its peaceful intentions", which it could only do by "complying with all of the Security Council resolutions to which it is subject". But was it really "possible to conceive of such a government under Saddam Hussein"? An evaluation of Iraqi conduct revealed to Albright that "Saddam Hussein's intentions will never be peaceful". Clearly, the ceasefire resolution, which was objectively, even if unreasonably, phrased, has been transformed into an instrument for the US's own unilateral agenda in Iraq and the region. And it is logical in the context of stated American policy, to read the recent airstrikes – carried out without a reference to the UN, on the basis of an extremely specious report from UN weapons inspector Richard Butler – as an element of broader strategy, rather than merely as punitive forays.

Stirring at the basis of the regime of 'air control' is the notion that explosive force applied from the air can influence political events on the ground. Various official spokesmen made it apparent during the recent airstrikes, that their ultimate aim was to weaken Saddam Hussein's key constituencies – such as the Republican Guard military units – and if possible, to goad them into a decisive coup attempt. This resurrects a military doctrine that was applied in all its variants in the Vietnam operations, only to fail every test of military efficacy. One of the principles that was applied was that of 'interdiction' bombing to choke off the corridors of guerrilla operation in Vietnam. The large number of civilian casualties that resulted only made the US more permissive as far as 'saturation bombing' was concerned. And then, even if the base inhumanity of the carpet bombing in Vietnam were overlooked, the results in purely military terms were dismal. In 1967, US secretary of defence Robert McNamara summed up the lessons learnt from the application of the various bombing doctrines: "As to breaking their will, I have seen no evidence in any of the many intelligence reports that would lead me to believe that a less selective bombing campaign would change the resolve of the North Vietnamese leaders or deprive them of the support of the North Vietnamese people."

Sir Robert Thompson, a veteran of Britain's colonial wars of the 1950s, developed upon this assessment. The single most important feature of guerrilla warfare in a predominantly rural setting, he pronounced, "is its immunity to the direct application of mechanical and conventional power". This was a chastening appraisal, but it only provoked the political theorist Samuel Huntington to add what he thought was an important qualification: "If 'the direct application of mechanical and conventional' power takes place on such a massive scale as to produce a massive migration from countryside to city, the basic assumptions underlying the doctrine of revolutionary war no longer

operate. The Maoist-inspired rural revolution is undercut by the American-sponsored urban revolution."

This was the doctrine and the sensibility that underwrote the US's massive campaign of chemical warfare in Vietnam – perhaps the greatest unaccounted war crime of the post-second world war period. The lethal toxin Agent Orange was dumped on Vietnam in massive quantities, to strip its jungles of all foliage. In the fevered imagination of American technological jingoism, this would expose the population that was otherwise sheltered in the jungles to the application of "mechanical and conventional power". On the ground, "an accelerated pacification programme" was inaugurated as a complementary measure. Entire villages were cleared and their residents herded into urban centres under American supervision. "Forced-draft urbanisation and modernisation", said Huntington in the exultation of discovery, would rapidly bring the country "out of the phase in which a rural revolutionary movement can hope to generate sufficient strength to come to power".

The US went through a prolonged process of learning in Vietnam. By those standards, the mission of air power in Iraq is relatively uncomplicated. Unlike Vietnam then, Iraq is a highly urbanised and industrialised society, whose civilian infrastructure is vulnerable to the application of "mechanical and conventional power" in a manner that rural hamlets are not. The 1991 bombing campaigns by the US and its allies did a comprehensive job of demolishing the country's infrastructure. But the political events that have followed this application of mechanical power have not conformed to American expectations. The regime remains in place, still able to summon up the residual defiance to beat back Richard Butler's crude efforts to penetrate its innermost recesses, still able to cock a snook at the western powers by challenging and engaging the aircraft patrolling the 'aerial exclusion zone' illegitimately imposed towards the northern and southern reaches of Iraq.

The US is the long-term loser from this uneasy stalemate. Popular opinion in the Arab world is now alienated, and friendly regimes have been undermined by a tide of resentment at the continuing suffering in Iraq. Unsurprisingly, assassination has presented itself to the fevered American imagination as a quick and painless way out of the limbo – an aspiration that the American media gave free vent to during the crisis over the UN weapons inspections in November 1997. The following sampling of media comments, liberally paraphrased from the magazine *Mother Jones*, conveys a sense of the pathological blood-lust that Iraq seems to excite in US policy circles:

> *Newsweek*, on November 17 ran a story headlined 'Take him down'. It left little room for ambiguity – either about the target of this exhortation or about the inexorable direction of the force of gravity – the headline was run right next to a photograph of Hussein and a downward-plunging arrow.
>
> Thomas Friedman, foreign affairs columnist for the *New York Times* (November 6), invoked a divine purpose for the American military's technological prowess: "Saddam Hussein is the reason God created cruise missiles ...So if and when Saddam pushes beyond the brink, and we get that one good shot, let's make sure it's a head shot."
>
> George Stephanopolous, a former intimate of the American president and now a TV news analyst, argued on ABC's 'This Week' (November 9): 'This is probably one of those rare cases where assassination is the more moral course...we should kill him' Sam Donaldson, co-host of 'This Week' (November 9), chose to enter a caveat: it was not morality alone that was invoked in the case at hand, since international legality could provide the rationalisation for an American mission of assassination. We should kill Saddam, he said, but 'under cover of law'. The act would pass the scrutiny of international legality, and the US could 'do business with his successor'. In response, Bill Kristol, ABC news analyst, commented that the proposition sounded 'good'. And this feast of concord was joyously received by Cokie Roberts, co-host of 'This Week', and endorsed for appropriate further action: "Well, now that we've come out for murder on this broadcast, let us move on to fast-track..."
>
> Other forums showed an awareness of the logistical difficulties involved, though not for the legal and ethical issues. Here is Jonathan Alter in *Newsweek*, November 17: "It won't be easy to take him out. ...But we need to try, because the only language Saddam has ever understood is force." A fortnight later, *Newsweek* chose to dignify the theme with a strongly affirmative headline to its editorial column: "Why We Should Kill Saddam".

Whatever elements of sobriety there may have been in the midst of this babble only suggested that a relapse into insanity would be a welcome prospect. An illustration was Laurence Eagleburger, former American secretary of state, who appeared on the same show in which Stephanapolous made his impassioned plea for a surgical assassination. Eagleburger took the cool and detached view – he upbraided his young and impetuous colleague for the advocacy of political assassination as an instrument of foreign policy and urged that the crisis arising from the stalled arms inspections in Iraq should be dealt with through a massive show of air power in Iraq, indeed, nothing less than a reprise of the brutal aerial bombing campaign that the US unleashed during the Gulf War. He was convinced that a second visitation of American air power would ensure Iraqi compliance with even the most irksome conditions imposed by UN weapons inspectors. And in the final reckoning, the destruction wrought from the skies would, he said, provide an inducement for disgruntled elements within the military to get rid of Saddam Hussein and bring in a leadership more amenable to western tutelage.

That assault has now taken place, though one year later than the US wanted. Its immediate effect is that the UN disarmament mission in Iraq – pursued with maniac vigour and little regard for truth by the Australian diplomat Richard Butler – is dead. The regime of President Saddam Hussein remains in place, its legitimacy underwritten by the efficacy with which it has managed a situation of acute domestic stress and international isolation. In a nation enervated by sanctions, the regime seemed a push-over for any application of military force. Yet, two identifiable American efforts to overthrow Saddam Hussein have failed. The Iraqi National Congress – a creation of British and American intelligence – sought to launch a major military offensive from the northern region. This initiative collapsed in disunity and disarray in 1996. Shortly afterwards, the Iraqi National Accord, which sought to foment a military coup from the security of the Jordanian capital of Amman, suffered ignominous rout at the hands of the Iraqi intelligence services.

The new intrigues that the US administration has dreamt up in league with its worshipping acolytes in Britain, remain unknown as of now. Military power on an awesome scale has been deployed in the region. And it is also germane, that the US has substantially raised its 1999 military budget in direct response to the unresolved dilemmas of west Asia. Brute force, the world is reminded, remains an option when unsubtle intrigue and coercion by starvation fails. But if anything, the lessons of the eight years that have passed since the Gulf War are that American designs on Iraq, if they do not collapse at the moment of their conception, will at their moment of fruition, only engulf the entire region in a phase of violent instability. And since the well-being of Israel is the fixed and immutable basis of US policy in the region, few alternatives seem available, but a continuing denial of Iraq's sovereignty and the bottling up of regional tensions through the naked display of armed power.

An Agenda for Gender Politics

Wandana Sonalkar

Patriarchy in India starts with the control of women or men in the family but works in such a way as to perpetuate caste hierarchies; and the preservation of caste is the basis for the functioning of this patriarchy. Will the passage of the Women's Reservation Bill as it is, as a first measure, without a wide-ranging discussion of the underlying caste issues really empower women in the struggle against patriarchy in the social and political specificity of present-day India?

TWO issues of gender politics which are currently being debated are, firstly, reservations for women in parliament and state legislatures, and secondly, the ongoing debate over the Uniform Civil Code. Feminists have taken up a nearly unanimous position supporting the proposed 81st Amendment to the Constitution, which seeks to reserve seats for women in the said bodies. On the second issue also, after a considerable amount of controversy and disagreement, a kind of consensus has been reached on giving priority to fighting for women's rights within the framework of existing personal laws, rather than pushing for a Uniform Civil Code at present.

Both the consensus in one case and the unanimity in the other are, I feel, very problematic: they have become possible only because the scope of the debate has been limited in two ways. Firstly, the perception of the history of the issues being debated is usually narrow, with the assumption that feminist politics in India really began after 1975, events predating this are mentioned only cursorily. This leads us to the other question of who are the feminists, whom are we speaking for and by what authority? In general, this means that in arguing for a greater concern with feminist issues in contemporary politics (and to argue thus is of course an urgent need), the broader political context within which we operate is often forgotten. This paper tries to explore some of the questions that should be addressed in this regard.

Both the specific issues mentioned above: reservations for women, and the Uniform Civil Code, are concerned with the very nature of Indian democracy, and its functioning in today's context. It is significant that the women's movement is today debating these issues, as it means that we have reached a stage of maturity which makes such an intervention in the broader democratic process both possible and necessary. But then we must remember that our history is not only the history of the post-1975 women's movement in India. One important series of events in that history is Ambedkar's motion in parliament for a Hindu Code Bill (HCB) when he was law minister, the defeat of the motion and his subsequent resignation. Ambedkar's insistence on a codification of Hindu personal laws has a double significance which is relevant to the current controversies. One, the Constitution which outlined a concept of citizenship and basic human rights did not touch on the religious life of the majority of Indians, while religion (that is, for the majority, Hinduism) was nevertheless a site for the preservation and reproduction of inequalities among Indian citizens. So, side by side with the Constitution which deals with the political and economic rights of citizens, a specific codification of Hindu personal laws which targeted the inequalities in the religious practice of citizens was essential. Secondly, such a codification should, in Ambedkar's opinion, precede the movement towards a 'secular', Uniform Civil Code. Later on, some of the laws contained in the proposed Bill were passed as separate acts.

Since some of the opponents of the proposed 81st constitutional amendment have brought up the issue of reservations for non-upper caste women within the reservations for women in parliament and state legislatures, the question of caste and gender as aspects of the citizen-subject has been brought to the fore. Most of the feminists arguing for reservations have attacked or dismissed this argument (epitomised in the statements of Sharad Yadav) as patriarchal and motivated – and they are not entirely wrong in this, if one looks at the records of the parliamentary debates that took place during 1997 after prime minister I K Gujral put the issue of reservations for women on the agenda of the Common Minimum Programme.[1] But in fact the point raised here touches on the fundamental question of the constitution of the citizen-subject, and here the considerations that weighed with Ambedkar in his moving the Hindu Code Bill are still relevant, even if the political context is different now; because they have something to do with the essential nature of Indian society. If we look at Ambedkar's concerns in this light, we can take issue with the arguments put forward by most of the feminist pro-reservationists. In the process, we may be able to reach a clearer idea of our priorities in today's political context.

Ambedkar and Hindu Code Bill

Ambedkar has gone on record as saying that he considered his work on the Hindu Code Bill to be as important as his participation in the formulation of the Indian Constitution. The Constitution views the citizen as a secular subject, and the rights of citizenship are restricted to the spheres of public politics and economic activity. But he insisted that it was not sufficient to recognise the right to political and economic equality in a 'secular' space defined in the Constitution, as long as inequalities among citizens, especially and particularly on the basis of caste, continued to be entrenched in the religious life of the Hindu majority. We must remember that at this time Ambedkar had not yet moved to the point of embracing Buddhism, although he had considered this option. He saw the Hindu Code Bill as a basis for the reform of Hindu society. Although he certainly did not believe that this reform could be carried out through legislative fiat alone, he sought to lay down some minimum principles within the legislative framework of personal laws. For this purpose he made a study of the Mitakshara and Dayabliaga systems of Hindu laws governing marriage, divorce and inheritance, as well as looking at the practices of smaller communities within the Hindu fold. He considered that the most progressive principles in the existing Hindu codes should be incorporated into the 'modern' Hindu Code Bill.

Ambedkar insisted on enshrining in the Hindu Code Bill some basic tenets on which there should be no compromise: the right to divorce for the woman, the outlawing of polygamy for those married under Hindu law, and the granting of some unconditional rights of inheritance for widows and daughters were among these.

He also insisted on the recognition of intercaste marriages as valid under Hindu law. Although a Special Marriage Act which contained such rights and freedoms for those wishing to enter into a civil marriage contract was already in existence before 1947, only a small minority of persons actually opted for this. Ambedkar's concern was that these minimum tenets be put into the Code for Hindu personal laws, so that women entering into marriage based on religious practice should have the benefit of these rights.

The record of the debates on the Hindu Code Bill in the Lok Sabha between 1947 when the motion was tabled, and the time of Ambedkar's resignation as law minister, shows the violence of the opposition of orthodox forces to these proposals. It is interesting to note that these forces articulated their reactionary positions on the question of caste as well as gender: it was of course said that giving the woman the right to divorce would destroy the traditional family, etc. In addition, Ambedkar was subjected to sarcastic attacks for trying to be a modern 'Manu'.[2] Underlying this was a reference to his caste. Although Nehru supported Ambedkar in the beginning, he gave in under pressure from the reactionary forces as general elections drew near. Among Ambedkar's supporters were some eminent women MPs. When the. . women took issue with Ambedkar over the scope of inheritance rights granted to women under the bill, his reply was that he did not see the Hindu Code Bill as a final answer to the question of women's rights: it would be the task of future political movements to extend the scope of these rights and to push for the enactment of new laws.[3]

This cursory account of some of the central aspects of Ambedkar's motion of the Hindu Code Bill and some of the reactions to it should be adequate for us to understand the relevance of that debate to the current one. What is important is that behind Ambedkar's efforts to put the bill through parliament is his vision that women are central to the fight against the caste system, that the subjugation of women is central to the functioning of the caste system, that women are, in his words, the gateway to the caste system. Thus the brahminical forces that uphold caste must take control of these gateways in order to perpetuate the system of caste hierarchy and caste oppression. The need to enact a juridical code that provides for emancipation of women in the areas of marriage, divorce and inheritance is essential because side by side with a Constitution giving political and economic rights to citizens, there must be a progressive Code which allows for revolutionary change in Hindu society, in religious practice. To put it differently, he saw the need for a reform of Hindu civil society – an essential characteristic of which is that it is divided on the basis of caste – side by side with a Constitution that established a 'modern' and 'secular' political society. And he saw the emancipation of women as central to that reform.

The point here is not whether the adoption of the Hindu Code Bill as proposed by Ambedkar would have been sufficient to bring about the emancipation of women. But we may ask why the bill was opposed with such virulence when he moved it, whereas most of the laws contained in it were, just a few years later, passed without any such bitter opposition? Could it be that the proposal of a reformist Hindu Code was seen as a direct challenge to the patriarchal and caste-based Hindu order, while separate laws were not seen as such a challenge? (Of course, even where such laws have been adopted, their violation is the norm: take, for example, the issue of intercaste marriage.[4]) There would have been a different juridical history if such a Code had been adopted. Lawyers fighting cases for women against a patriarchal Hindu social order would have been able to appeal to certain progressive principles on which the Code was based. One underlying implication of this would have been that the distinction between the public and private spheres of life would have been defined differently. That is, instead of relegating religious life to a private sphere, and allowing religion-based personal laws to govern those areas of the private that are recognised as encroaching on the public sphere – on the occasions of marriage, divorce and inheritance – there would have been a recognition that certain principles of social reform are to be applied to the private sphere as well. Let us not forget in this context one of the most powerful slogans of the early years of the contemporary feminist movement: "the personal is political".

The above paragraph is not intended as an exercise in 'what might have been'. It aims to bring out the radical nature of Ambedkar's attempt to get the Hindu Code Bill passed in parliament. That bill recognised the intrinsic link between caste and patriarchy in Indian society, and aimed to lay down a juridical basis for a future struggle against both. The granting of full adult franchise to women at the time of national independence – radical though this was in comparison to the late dates at which many European nations granted votes to women – and the inclusion of the principle of equal pay for equal work for men and women in the Directive Principles of the Constitution are inadequate from the point of view of this struggle and have indeed been shown to be inadequate by subsequent developments.

The point that Ambedkar recognised was that the caste system is perpetuated by endogamy; at one point he advocated intercaste marriage as the only programme of action that could lead to the elimination of caste. Later on, it seems that he saw the inadequacy of this line of action taken on its own; yet even today it is an act that is perceived by the forces upholding the caste system as a threat to the prevailing order and invites the severest punishment. The imposition of the rule of caste endogamy entails the control of women's sexual behaviour and in fact all aspects of their social behaviour by the patriarchal caste panchayat. The Hindu Code Bill entailed a clear declaration that the law of the panchayat would be limited in independent India, that this Code for the Hindu majority would hold precedence over patriarchal caste panchayats or undeclared caste authorities. It is no wonder that it invited such bitter opposition from the defenders of the traditional Hindu social order.

Caste and Gender in Indian Society

Caste is perpetuated through endogamy, but then it operates through a number of social and economic institutions and ensures, first and foremost, that the domination of the upper castes and the subservience of the lowest castes is preserved. Women of the lower castes remain at the bottom of the hierarchical order, they have no right to privacy or decision-making and no right of protection against sexual exploitation. This can be seen in the question put by a judge to Bhanwari Devi when she went to court against her upper caste rapists: "How far apart were your legs when the rape took place?" The practice of caste builds up what Pierre Bourdieu calls a 'doxa', a set of shared beliefs and norms within a community which condition the behaviour of its members without being openly declared. A member violating the rules of the doxa invites social sanctions of various kinds, including the most violent. But the doxa operates on an unarticulated level apart from one's consciously declared beliefs. This level is different from the Freudian concept of the unconscious which refers to the formation of the individual personality in the European context. Perhaps the concept of 'neniv' as opposed

to 'janiv' as used by Sharad Patil[2] (and borrowed by him from Buddhist philosophy) comes closer to what we need to analyse this situation. For the doxa or the neniv is social in content: in Indian society it incorporates all the aspects of caste identity, caste prejudice, hierarchy, and submission to a patriarchal order which are so much a part of the lived life of constitutionally equal Indian citizens.

Fifty years after independence and after the defeat of the Hindu Code Bill, these realities of Indian society are pushing themselves into the political arena. The result is a disruption of the consensus on the secular and democratic basis of Indian political life, which existed for some decades after 1947; the disruption makes room for the coming to power of the BJP by default, so to speak. Nivedita Menon (1997), for example, voicing what she calls her ambivalence on the question of reservations for women in parliament, says "We may need to think in terms of quotas within quotas – OBC within women's quotas, woman's quotas within all others and so on – and most certainly of how to ensure the possibility that newer groups can always present themselves to be recognised." The need for a pluralist approach is important when we are seeking to extend the scope of our democracy, as Menon implies in the quoted passage. Those who see themselves as a group seeking political representation should have the chance to do so, the openings for this should be built into our political institutions. But do 'women' really constitute such a group in reality? Don't caste groups have more claim to being marginalised categories with a social cohesiveness and common modes of being oppressed, which entitles them to seek political recognition as a group?

The issue is not just one of identity politics, a term now used without much clarity to describe the contemporary phenomenon of the political assertion of various marginalised social groups which identify themselves on the basis of caste or community (dalits, Muslims, adivasis, OBCs). Ambedkar's concern here is with the social inequalities that perpetuate themselves in spite of legislation to the contrary, in spite of the declared 'secular' politics of the major political parties - even those on the left.[3] Feminists are, or should be, familiar with this. It is the feminist movement that coined the slogan "the personal is political". Ambedkar wanted, through the HCB, to redefine the sphere of the private in a systematic way, to put progressive values into the sphere of religious practice and establish a basis for changing the exploitative social practices that, in fact, from a part of the Hindu's religious life. This could not be achieved by the stray laws that we now have banning untouchability or legitimising the right of temple entry to dalits. The HCB was an attempt to assert that the personal is political.

Politics always involves an assertion of rights and the demand for their legitimisation in social practice. These rights may appear at times insubstantial in content, but the process of assertion is a challenge to the prevailing doxa, and therefore important. In recent years we have been witnessing an upsurge of political activity on the part of oppressed social groups in India. Two examples from the recent history of Maharashtra may illustrate this point. One is the movement for the renaming of the Marathwada University in Aurangabad, Maharashtra as Dr Babasaheb Ambedkar Marathwada University, which spurred a mobilisation of dalit youth and in 1978 called forth a series of violent attacks on dalits in villages throughout Maharashtra. The other is the demand being posed by some dalit women and later taken up by the RPI under the leadership of Prakash Ambedkar, that December 25, the day on which Ambedkar publicly burned the *Manu Smriti* in 1927, be declared as Indian Women's Liberation Day. A woman activist from one of the communist parties responded to the latter demand by saying, "How long will we go on fighting on issues of identity politics? We have to address the real economic issues." The two examples cited above clearly represent challenges to the prevailing doxa: this is evidenced by the reaction of the defenders of the traditional order. Though the demands are symbolic in nature, as long as the doxa is real, the struggles to achieve them are also real.

Another example: we can recall the near-unanimity of the press in condemning the V P Singh government when it sought to put the recommendations of the Mandal Commission into practice. One would have thought that the Mandal Commission had committed the sin of creating caste divisions where none existed. While reservations in government and semi-government jobs have a definite role for members of the backward castes in creating a bit of space for upward mobility, the violent passions that appeared to agitate the anti-reservationists were surely wildly out of proportion to the actual threat to the job opportunities of upper-caste students, especially at a time when the total number of jobs in the public sector was stagnant and expected to dwindle in the future. Here too, what was being threatened was an unstated right, a part of the doxa: the right of the upper castes to dominate in the administration and in education. On the other hand, the BJP faces no such problem when it takes up the issue of women's reservations. The opposition to the bill is now taking shape around a different set of issues, with the demand for reservations for OBC women within the reservations for women in parliament.

Let us turn at this point to the arguments and the logic used by feminists to support the demand for reservations for women in parliament. Kiran Moghe, member of the CPI(M) and an active functionary of the party's women's wing in Maharashtra, says in her Marathi pamphlet quoted above, "There is definitely a difference between a *caste woman of the landlord class* and a *dalit woman agricultural labourer* (emphasis mine). But on the other hand her exploitation as a woman at the hands of men is something that cuts across all castes and classes. That is to say, the oppression suffered by a woman zamindar or a woman agricultural labourer at the hands of men (of her community) in the family or in society is one and the same: on that level their sufferings are the same. Hence the debate over whether all women are equal or not is meaningless and unnecessary (pamphlet written by Kiran Moghe published by CPI(M), Maharashtra, 1997).

There are at least two problems in this argument. One is that the categories of class and caste are conflated and the implication is that whatever difference there is between the dalit woman agricultural labourer and the caste Hindu woman from a zamindar family exists only, or 'fundamentally', because one is labourer and the other a landowner. It ignores entirely, for example, the sexual exploitation suffered by a dalit woman because of her position in the village caste hierarchy. For example, Muktabai Sarvagod (1983), in her book *Mitleli Kawade* recounts how a young widow of the (non-dalit) mali caste could live her life in her village with dignity even though she had no land and three children: she received help and moral support from members of her caste. A dalit woman in the same position would not have had this freedom.

Secondly, Moghe refers to exploitation of the woman by men of her own community, in the family and in society, as if her relations with men of other communities don't matter. This is a serious mistake in understanding the nature of oppression suffered by women of different classes, and especially castes, under a

patriarchal system. In fact Moghe betrays ignorance of the concept of patriarchy, which is linked up to the way in which power over women is articulated in the family first, and then in society at large, through the hierarchical structuring of that society. The reality is that the upper caste zamindar woman will have women and men servants to lighten her work in the home, an economically deprived woman from the middle castes will have the support of caste kin in better circumstances (see above); whereas the dalit woman has no social defence against sexual and other exploitation from upper caste men in her village. And although each of these women may live within a patriarchal family structure, that structure also serves to reproduce her position in the caste hierarchy.

We have been arguing that the nature of patriarchy in India is intimately bound up with the institution of caste, and that Ambedkar was always sensitive to this. All this has a bearing on the demand for reservations for women in parliament in the present political conjuncture. If the isue of reservations for women is seen as a demand empowering women against domination by men *per se*, this amounts to abstracting the citizen-subject both from the reality of the social space that he/she inhabits, and also from the present articulation of our democracy. If, on the other hand, we are sensitive to both these, we can easily see that the demand for quotas within quotas, and the demand that the details of these be worked out before reservations are granted to women is more than a delaying tactic being used by chauvinist men of the not-so-badly-off middle castes.

There is, therefore, an attempt by the spokespersons of the 'women's movement' (within and outside left political parties) to use this issue as a rallying point for women as a category on a national-scale. However, as Madhu Kishwar points out (In discussion with Jaya Jaitly in 'Samvad', *The Times of India*, August 15, 1998),[5] they have not been successful in mobilising the support, in any appreciable number, of the women they claim to speak for. Also, we find, during the dabates on this question, in the argument that OBC men are insincere in bringing up the issue of reservations for 'their' women, the idea that oppression of women by men of their own community is the fundamental reality of women's oppression in India, cutting across classes and castes.

I have argued above that this line of thinking stems from an essentially incorrect understanding of how patriarchy operates in Indian society. Patriarchy in India starts with the control of women by men in the family but works in such a way as to prepetuate caste hierarchies; and the preservation of caste is the basis for the functioning of this patriarchy. Will the pushing through of the bill as it is, as a first measure (as it is said), without a wide-ranging discussion of the underlying caste issues, really empower women in the struggle against patriarchy in the social and political specificity of present-day India? Or would it not be better to use this occasion as the starting point of a debate on caste, gender and the nature of political representation? Yadav had to apologise publicly for the patriarchal tone of his comments in parliament; this is a positive outcome. We are also currently witnessing a critical juncture in the dynamics of political representation, with the caste non-elite in various regions of the country attempting to find new modes of political articulation. The resulting instability in the functioning of parliamentary institutions cannot merely be dismissed or deplored as a deterioration of the political climate. The women's movement must try and engage with these realities and relate to them in the context of its past gains and its programme for the future. The debate on reservations has not till now given them much thought, but it is a welcome development that some debate on the issue of reservations within reservations has now been initiated.[6] A certain delay in the implementation of a bill providing more seats for women in parliament appears to be tolerable, if we are going to give serious attention to a long-neglected set of political issues.

If we remember the political context in which the bill emerged in the first place: the earlier (73rd and 74th) constitutional amendments which made it mandatory to reserve at least one-third of the seats for women in local elected bodies, had been introduced as a move towards decentralisation of power. This was the broader perspective within which women actually living and working in villages, towns and cities were given the opportunity to act as political representatives on the local level. Women's organisations have welcomed this as a potentially empowering provision, and have worked to give support to women elected in this set-up. The entry of women into local political bodies has at times been manipulated by the male-dominated political parties, and in some situations the elected women have been neutralised or even sexually humiliated. But this is only to be expected, since these amendments have made it possible for the first time for women from the lower strata of society, women of all castes, to participate in large numbers in a political process from which they have hitherto been excluded.

The logic of decentralisation of power does not apply to the issue of reservations for women in the national and state level elected bodies. This demand has been taken up with enthusiasm by the left political parties, or the women (who are present in a minority) within them, and later on by the 'autonomous' women's organisations. Meanwhile the 81st Amendment became the 84th Amendment (without substantial change) and the BJP declared that it would get it passed through parliament. Almost all these pro-reservationists found a ready target when male OBC politicians brought up the issue of reservations for OBC women, expressing themselves in openly patriarchal language. So we have the major argument being pressed (exemplified in Kiran Moghe above) that oppression of women by their men cuts across all castes and classes.

To sum up this stage of the argument: the demand for reservations for women in parliament, as it is being argued by feminists (who suddenly find themselves in the company of the BJP), glosses over the fact that, in India, patriarchy operates through caste, reproduces caste hierarchies, and also uses caste divisions to perpetuate itself. We are merely saying that the category 'women' does not have sufficient unity to represent itself as apolitical group cutting across class, caste and community, though this may also be true in the present conjuncture. Rather, the point being made is that the mode of oppression of women in this society is so intimately bound up with caste that both issues have to be addressed together, especially when one is talking about reservations in parliament, an issue that will affect the functioning of politics on the national level and therefore touches on the nature of the citizen-subject. If the proposed constitutional amendment is directed towards expanding the rights of citizens to emancipation from social oppression – which is presumably what it intends to do – then let us recall how Ambedkar had understood the question more than 50 years ago. The defeat of his bill at that time has unfortunately meant that the questions he raised about the nature of citizenship in India have largely been neglected since then.

Recently there has also been a demand for reservations for Muslim women; this has been spearheaded by Shahabuddin and some educated Muslim women have supported it. However, there are constitutional problems involved in granting reservations to Muslim women, which do not

arise in the case of OBC women. Some are asking the question: why reservations for Muslim women or OBC women, when Muslim men and OBC men do not have reservations? It will not do to call these another set of 'delaying tactics'. The point I am making throughout is that much wider political and constitutional questions are involved in the issue than was realised at first, and that Ambedkar was sensitive to many of them. We need to take a second look at what he was saying, not necessarily to take his word as final. In fact, some innovative alternatives have also been proposed, such as the possibility of multiple-seat constituencies: why not elect one man and one woman from every constituency? In any case, the number of members in the Lok Sabha has remained constant since independence, while the population represented by them has increased several times.[7]

Uniform Civil Code

Ambedkar's speeches and writings at the time of his moving the Hindu Code Bill also have a bearing on the debate over the Uniform Civil Code (UCC), especially among feminists. Even at that time the defenders of the brahminical Hindu social order cried against the reform of Hindu personal laws protesting that the Muslims should be forced to adopt a UCC. Ambedkar was strongly against this: he gave the highest priority to the reform and codification of Hindu personal laws which affected the majority of citizens, then, as now, Hindu fundamentalists tried to present the UCC as a necessity for the 'modernisation' of the Muslim community. But Ambedkar was very clear in saying that unless the Hindu community adopted a code that included a cohesive set of principles for reducing caste and gender-based inequalities in personal law, it had no right to insist on imposing a UCC on Muslims.

Talking about the concept of the secular state, he said: "(it) does not mean that we can abolish religion. it does not mean that we shall not *take into consideration* (my emphasis, he doesn't say 'respect') the religious sentiments of the people."[8] But, taken together with his attempt to reform and limit the scope of Hindu religious authority, his statement is quite different from what secularism has come to mean today – a neutrality of the state *vis-a-vis* religion seen as the private concern of individuals. Besides the fact that this neutrality can be compromised, this conception of secularism can support the growth of religious fundamentalism in both the majority and minority communities. Ambedkar, on the other hand, while arguing for the Hindu Code Bill in parliament, was questioning the division between public and private space which informs the Indian Constitution: it is because religious authority also has its oppressive social effects – going beyond the private sphere – very especially in relation to caste and gender, that he considered a codification of personal laws for the majority community to be essential as a supplement to the Constitution. If the Hindu Code Bill had been passed, the debate over the UCC would, 50 years later, have had a very different content.

Among feminists, there is now a broadly accepted position that, instead of working towards a UCC at present, it is tactically more important to fight for justice for women within the scope of existing laws and also of existing customary practices, where they provide more protection to women, while working for a reform of different personal laws. It is recognised that Hindu personal laws are not necessarily more progressive than Muslim laws in this respect, but "all personal laws discriminate against women".[9] Some feminist groups have attempted to formulate a 'gender-just' civil code as an ultimate goal to move towards in a longer persepctive, even while they accept the tactical position outlined above. Nivedita Menon, in the article cited above summarises the content of these attempts.

We are not interested here in the differences between various groups on this issue. The question of putting on the feminist agenda even a 'longer perspective' of working towards a set of gender-just laws, it seems to me, suffers from the same faulty vision as the approach that has been taken to the issue of women's reservations. In regard to the minority religious communities (to quote Menon again),[10] "reform within personal laws with the co-operation of community leaders is preferable to legislation by the state", in order to "negotiate the maximum possible space for women as individuals within their communities". This is a tactical position that admits, in effect, that 'the feminist movement' has not so far been able to mobilise large numbers of Muslim or Christian women within its fold. But has it really done so for the majority of Hindu women either? Does the attempt to work out a 'gender-just' civil code grapple at all with the realities of how patriarchal oppression functions in our society? It is striking that Ambedkar's position on the UCC is never cited in any of these discussions. If this attempt to work out a code is to become more than an academic exercise, it must look at the history of the women's movement from a less self-centred angle. The defeat of the Hindu Code Bill was an important event in that history whose significance we must examine, before we can work out some politically correct and 'gender-just' code. Even today, adivasi women are not covered by Hindu personal laws, which leaves them without any legal defence against certain kinds of exploitation. It would, in fact, be more relevant at the present juncture for the feminists to re-open the question of a code of personal laws for Hindus, because that would really touch on the issue of the spheres of public and private, of caste discrimination and its relationship with the patriarchal oppression of women: issues which affect women of the minority communities as well.

This brings us back to the other question posed at the beginning of this paper: who are the feminists, and by what authority do we claim to speak for the majority of Indian women? The feminist movement in India in recent times began in the 1970s. Initially an offshoot of the movement in the west, it naturally first attracted English-speaking, urban women who more likely than not were middle class and upper caste. In fact, the women's liberation movement in the west also took a long time to spread beyond the limited world of white, middle-class women with higher education. In India, however, one could argue that social barriers are even more rigid and social inequalities even more stark in relation to caste than they are in relation to race in the developed world. Indian feminists from the very start tended to, say, yes, we are oppressed by patriarchy, but our poorer sisters from the working class and the villages are much more oppressed. Some women, motivated by such perceptions, actually went out to the villages, slums, forests and mines and organised different sections of women there in struggles for their economic and other rights. There are some such feminists who now have experience of this kind of work stretching back over 25 years. Also, there were lawyers, journalists, writers and academics who took up arms 'against patriarchy on many fronts. International Women's Year in 1975 sparked off a large number of research undertakings by the government and academic institutions where women were the explicit subject of research. Some women made their academic careers in this field. And then, over the last 15 years or so, has come a new crop of NGOs doing 'professional social work with a focus on gender issues. 'Gender' has – almost – become a universally accepted part of

academic and journalistic vocabularies.

Those of us who call ourselves feminists in India also carry on struggles with the men close to us for assertion of our rights, for an extension of freedoms. These struggles are real, they have their impact, they change the environment in which the next generation of women live their lives. But in themselves these struggles do not engage with the forces of patriarchy on a social scale. Educated upper caste women are granted freedom to work and move in society with relative ease, as long as they respect the broad rules of caste and class endogamy; minor violations on their part are also accepted. But the dalit or adivasi woman in the village is still seen as not having any rights. When upper caste, educated, middle class women participate in building organisations for asserting the rights of such women, they still carry their caste identity into the 'field'; they can deal with bureaucrats, judges and the police, while a dalit woman going to these officials with the same demands is still, in the India of 1998, in real danger of being raped. When the upper caste feminists venture into the villages and slums now with the additional backing of foreign funds, their organisations may become more sustainable but is their intervention any longer radical or capable of challenging the status quo?

This is essentially a call for introspection. What we are saying is that the familiar kinds of feminist initiatives taken in such a fractured social context are often neutralised, their impact far less than what we have hoped. I have tried to show that the initiatives are themselves based on a fractured conception of what the women's movement is. I think that 'we' have to realise that this fractured social context also splits ourselves in some fundamental sense. to go beyond this split we have to engage with the social forces of caste and patriarchy in a much more explicit manner. Let's put this on our agenda.

Notes

1 See, e g, Kiran Moghe's pamphlet (in Marathi my translation) on the issue of reservations for women in parliament: "Firstly, the OBCs as a group have never until today demanded reserved seats in legislative bodies. This recommendation does not figure among the many points listed by the Mandal Commission in order to improve the situation of the OBCs in light of their many sufferings. Of course, it is possible that a certain section of society may make such a demand all of a sudden – but it is no coincidence that the demand is expressed only in the context of the Women's Reservations Bill."

2 Ambedkar saw the *Manu Smriti* as a brahminical text that embodied the subjugation of women through the caste system. According to him, Manu represents the historical downfall of women from the higher status they enjoyed in ancient India. It has been argued [e g, Lata Mani 1989] that this view of the brahminical scriptures, especially the *Manu Smriti*, as the juridical basis for the subjugation of women is itself the product of a discourse initiated in colonial times, when the British rulers took issue with certain Hindu practices like 'sati' and child marriage. That discourse, which comprises the arguments of the British and Indian pro-reformers, is itself historically situated and should not be left unquestioned. It is true that Ambedkar saw his HCB as a challenge to the law of Manu, but, as mentioned above, he did in his drafting of the bill draw on a multiplicity of Hindu texts and also on customary practices of smaller communities, looking for the most progressive elements therein. His objective was to incorporate into the code principles that were relatively emancipatory for women as well as being in some sense Hindu in their genealogy.

3 Although Ambedkar himself gave a central place to his work on the HCB, remarking that he had accepted the post of law minister in the Nehru government only for the purpose of bringing it into law, his efforts for the emancipation of women were not confined to this. From his burning of the *Manu Smriti* in 1927, to his address to dalit women at the time of the temple entry movement, we can see Ambedkar as a consistent champion of women's rights, and especially of the rights of dalit women who suffer the worst atrocities of patriarchy and the caste system. This too must be regarded as a part of the history of the women's movement in India [Pratima Pardeshi 1997].

4 The Hindu Marriage Act passed in 1955 does validate intercaste marriage and marriages violating customary bans on marriages between specific categories of kin in certain communities. But it is the 'law' of the caste panchayat that rules in most such cases. Violent punishments for couples infringing the caste norms are still common in north India, and do occur in other parts of the country also [Prem Chowdhury 1997].

5 See Kishwar (1997). however, Madhu Kishwar's position on the issue includes repeating that the major obstacle to OBC women entering politics is the attitude of their men.

6 For example, the National Association of Women's Organisations held a debate in Hyderabad on September 16 and 17, which attracted a much larger attendance than the organisers had anticipated. No consensus emerged, but there was a significant number of women demanding that caste aspects be given much more serious thought, and that they are relevant even in the case of Muslim women.

7 Gail Omvedt has made this suggestion in a recent newspaper article.

8 Ambedkar, collected works, Volume 14.

9 Nivedita Menon (1997) mentions how a journalist who takes a totally anti-feminist position on another issue (the accusation of sexual harassment made by IAS officer Rupan Deol Bajaj against her senior IPS collaeague KPS Gill) can, however quite easily come out in favour of reservations for women.

10 Nivedita Menon (1998) surveys a wide field and brings out some of the problems in producing "accounts of human rights or 'citizens's rights', or, indeed, 'feminist' or progressive narratives ... at this historical juncture"; but her own position on the 'feminist consensus' on the UCC remains unclear. She tells us that this consensus talks about 'working on setting up a comprehensive gender-just framework of rights covering not just areas already covered by personal laws, but also the 'public' domain of work (creaches, equal wages, maternity benefits, etc) which should be available to all citizens. Where these laws do not conflict with personal laws, they should be automatically applicable, and where they do conflict, it should be open to individual citizens to make the choice.'

Limits of Economic Analysis

Sugata Marjit

Analytical Development Economics: The Less Developed Economy Revisited by Kaushik Basu; Oxford University Press, Delhi, 1998; pp 361, Rs 495.

KAUSHIK BASU'S *Analytical Development Economics* is an extended and modified version of his earlier textbook on development. It is now well known that Basu's earlier text has been a hit with both students and teachers of development economics in India and abroad. His was the first clean, classroom treatment of development economics. The profession needed a text badly to teach students how to use modern analytical tools to focus on traditional and contemporary development problems. The new and extended version includes two additional chapters on growth and development and the international debt problem. Both of these chapters are lucidly written, the models are well explained and the simple yet rigorous presentation of burning issues charms the readers.

Chapters 2 and 3 on the vicious circle of poverty and growth and development elaborate the age-old arguments in terms of recently developed structures. Among several papers written on the topic, Basu chooses the ones which should appeal most to the students. One particular issue missing in the discussion has to do with the problem of regional divergence and growth, an issue of monumental significance for large developing nations.

The chapters on inflation and growth and foreign exchange and trade retain most of the analysis available in the earlier edition. Basu's emphasis on Kalecki is noteworthy since many of the macro theorists in the west have failed to evaluate the true value of Kalecki's work. While the text gives a detailed account of the international debt problem, an area in which Basu has made notable contributions, the chapter on foreign exchange and trade seems to be a bit out of date. Both the 'two-gap' model and the so-called 'transfer-problem' are not the issues economists are currently bothered with. The conflict of multilateralism and bilateralism in world trade, liberalisation of trade and investment policies in the LDCs, trade-related intellectual property rights, multinationals, etc, are topics of growing interest. These somehow do not feature in the text. The paradoxical theorem on aid and welfare does not highlight the fact that in a two-agent setting, with usual preferences, if the Walrasian equilibrium is unique and stable, paradox cannot be the outcome. However, in a three-agent set-up bilateral transfer may lead to donor enrichment. The example Basu provides did come under severe criticism in the trade literature on the transfer paradox. There is a whole issue of the *Journal of Development Economics* discussing the problems associated with 'Chichilinsky Proposition'. Also it seems that the chapters are in need of a more explicit empirical orientation.

Basu's treatment of migration, unemployment and the rural economy is impeccable. Osmani's collusive theory of unemployment is a welcome addition to the section on surplus labour. Basu makes the task of a lecturer fairly easy by developing the details of a chapter with the vision of an outstanding teacher. Yet, in spite of being the most important development economics text of the contemporary world, it fails to draw our attention to some of the issues which shape the economic destiny of millions in the third world.

It is surprising that we never come across any discussion on the formation of state and making of economic policy in the text. Neither do we confront a scenario where an economist is visibly worried about the implementation of a policy, its adverse impact on the dominant influential political/social wing, its eventual dilution or disappearance. Hardly a section is devoted to the issue of governance, incentive structure, social norm, institutional constraints as manifested in the problems of centralised planning and/or decentralisation, etc. To some extent limitations of the mainstream treatment of developmental issues are recognised in the little concluding note on the identification of 'power' and its impact on resource allocation. But this appears as an appendage of the main content. Lewis's seminal piece on surplus labour, Sen's work on poverty, Stiglitz's contribution on efficiency wage have indeed clarified and enlightened complex issues – isolating logic from rhetoric, serious discourse from slogans and 'good' theory from 'bad' theory. Since economics can never aspire to give a definitive answer, prescribing good judgment is the most that can be suggested. Yet development economists in general fail to come to terms with the 'post-modern' nature of the problems. If modernity is synonymous with the inclusion and pragmatic application of analytical tools – mathematical or other – 'post-modernity' calls for identifying the right problems for a contemporary discourse. It is seldom the case that textbooks on development or write-ups in top development journals deal at length with the formation of economic policy, setting up of the agenda, implementation and hegemonic influence. Textbooks on development economics evolve around a traditional paradigm – is policy A the right one for target X, or should policy B be adopted? Hardly anyone questions how policy A has come to be formed and how policy B, with all its textbook merits, pragmatism and finesse will never be adopted in a particular country.

It is not the understanding of the policy itself that matters, it is the problem of implementation, in particular social, economic and cultural resistance to a particular policy, which should be focused in greater detail. A policy which fulfills reasonable criteria can be a disaster when tabled as a bill in parliament. A policy that belies every inch of common sense economics may be accepted wholeheartedly because politicians love it.

It is true that every book is written with a purpose. Kaushik Basu's attempt, to make students of economics familiar with the problems of development, is remarkable. It is a book like this that gives development economics a well-deserved respectability in the profession. At the same time, the book is constrained by the narrowness of the discipline. It struggles to come out of the recognised domain by throwing in chapter 15, 'The Limits of Economic Analysis'. Basu's own work on power, corruption and social norm do not find their proper places in the text. However, we may conclude on an optimistic note. One may hope that sometime in the future, in some later editions of the book, the author will traverse beyond the mundane and fulfil the promise of a more adventurous text.

From Welfare to the Good Life

Sarah Joseph

Theorising Welfare: Enlightenment and Modern Society by Martin O'Brien and Sue Penna; Sage Publications, London, 1998; pp viii + 248, £45 (cloth), £14.99 (paper).

THIS is one more of the many introductory texts which have come on the market in recent years. The book discusses a wide range of theories and political perspectives which the authors feel are of relevance for understanding the organisation of welfare in contemporary capitalist societies. It makes no claim to originality except in the manner in which it places the concept of welfare in the widest possible political and philosophical framework and locates important contemporary writings within the different perspectives which are discussed. If I were to place it within the classification well understood by students in India – guidebook, textbook, reference book – I would place it among the textbooks, which is where the publishers also have located it.

For the benefit of readers who may not understand the significance of the above classification, let me explain that students would define guidebooks as books which follow course contents fairly closely, and which obviate the need for further reading, perhaps even the need to attend classes. They require neither sophisticated language skills nor much understanding since they are often learnt by rote. The only skills needed are of cutting and pasting, skills similar to those performed by any word processing programme. Such books are obviously based on secondary material and they try not to espouse any particular political or philosophical perspective. There is a firm belief among students that guidebooks are the key to success in examinations. Even successful IAS candidates have been heard to boast about exclusively relying on them. However, every reader cannot hope for equal success and although students might blame 'the system' for their lack of success, it is likely that class-based skills such as language skills, and general knowledge and social poise probably provide that crucial extra.

At the second level, textbooks would be distinguished by being less closely linked to particular syllabii, by sometimes expressing preference for a particular perspective, and by requiring greater language and analytic skills than guidebooks. I would not here discuss the extra-ordinary and continuing success of books like Samuelson on economic theory which fall outside the mainstream of textbooks. Reference books would be those which make a substantial contribution to the subject discussed. In the life of many students in India today, all three may be supported by a floating pool of notes and tutorials which have scored high marks in the past. Even if publishers and teachers may not always know how to classify a book, students work with this classification quite easily. It is interesting to note that of late some students have entered the market as producers of books based on their notes and readings. It is good to think that our educational system does not at least kill entrepreneurial talents! But this is a digression.

The authors of *Theorising Welfare* have defined welfare "as a label for a complex and unstable mixture of relationships, experiences, processes and structures". Virtually every institution and process in contemporary capitalist societies is involved in the provision of welfare they maintain, from wasteland management to industrial production to the regulation of family life. Thus it is not welfare in the sense of the Beveridge plan which they discuss but welfare as anything which contributes towards well-being or happiness. The book claims an interest in expanding the potential for welfare by helping us understand the welfare implications of different philosophical and political perspectives. Liberalism, Marxism, Neo-Liberalism, Poststructuralism, Political Economy, Political Ecology and Post modernism constitute the broad headings under which theories and welfare policies have been discussed. The wide framework of analysis is both a strength and weakness of the book. On the positive side, it relates the discussion of welfare to contemporary developments and takes into account the new internal and external challenges facing the state today. Internal changes which have taken place in contemporary capitalist societies include changes in the techniques and organisation of industrial production which are summed up as post-Fordism, changes in the organisation or disorganisation of capitalism, and the decline of the traditional working class. External changes include changes in the role and functions of the state in an era of global capitalism. While the sheer range of theories discussed is impressive, a negative consequence is that this often leads to some tediousness for the reader. Further, it also dilutes the cutting edge of the concept of welfare. If virtually every social process affects welfare, and the focus on redistribution and equity is removed, welfare would lose much of its value either as a goal or as description of a particular kind of state.

A formidable array of theories and debates has been discussed in the book. One can only admire the capacity of the authors to summarise complex debates though it is not entirely exegetical. Interesting and critical comments are interspersed with chunks of summary. For instance, the limits of Keynesian policies and Beveridge's approach are clearly discussed and the welfare state in Britain of the post-war years is succintly described as a "technocratically supervised distribution rather than a redistribution system". Marxists have for long maintained just this but now this view is put forward by the authors as liberal wisdom as well as common sense though they draw different lessons from this to the Marxists. Welfare policies in contemporary European societies are discussed in the book with reference to the changes which have taken place in capitalism. Writers like Claus Offe and John Urry are quoted to argue that there has been a shift of interest in those societies from issues of poverty and need to quality of life issues and that the concept of welfare has changed accordingly. Moreover, changes in capitalism have meant that states have had to devise new strategies to deal with the new issues which are dominating the politics of European societies. Although the argument that the issues of redistribution and poverty removal are irrelevant may provoke some resistance in countries like India some aspects of the critique of traditional welfarism in the book raise important questions which have not been adequately addressed here. The charge that the ever-escalating demands for welfare can only promote environmental degradation is a serious one. The welfare state originated in capitalist societies and drew its resources from profits made in the market either through the direct involvement of the state in production or through taxation of producers. This increased pressures for innovation and development which have had a disastrous effect on the non-human environment. The hope was that the state would be able to regulate production to minimise environmental degradation but the figures quoted by the authors indicate

that even the German state, which has a relatively good record in this respect, has been quite ineffective in controlling industry. The prospects for developing societies are ominous. It might seem that the logical answers would be in the direction of pursuing redistribution more vigorously while at the same time trying to change the high-consumption notions of welfare which have captured the imagination of people all over the globe. But the authors content themselves with delineating the problems as they perceive them without going into possible solutions. Their main thesis is that theories of the welfare state were grounded in the enlightenment belief in a manageable and predictable universe and the possibility of individual and collective progress and that present day developments in capitalist societies challenge this worldview, replacing it with a multiplicity of competing and intersecting visions of the good life. The book has tried, with reasonable success, to explicate the implications and social costs of these different perspectives. It is dense with references and summaries of theories but it also draws attention to some important issues concerning welfare today. It could prove useful for those interested in the field although the cost may put off individual buyers.

Publicists and the People

G P Deshpande

Prints and Politics: 'Shibao' and the Culture of Reforms in late Qing China by Joan Judge· Stanford University Press, Stanford, California, 1996; pp xiv + 296, price not stated

THE world of Sinology was always fascinating. One of the many reasons why it has been so is the emphasis that world has placed on China's and Chinese intellectual aspirations. The role that language plays in modernisation and modernity is never lost sight of. The book under review is one of that large body of work in Asian history which does take the business of language and modernity seriously.

This is a study of a Chinese daily *Shibao* which means *The Times* except that the paper itself chose to translate *Shibao* as 'The Eastern Times' presumably to distinguish itself from the London or New York *Times*. This newspaper was founded in 1904 in Shanghai and continued its publication till 1939. This, however, is not a study in journalism. It is rather a study of the 'the print' as a 'mediated' medium. In the late 19th and early 20th century this meditation played a significant role in modernising Asian Societies. The people mostly responsible for this were those who belonged to *zhongdeng shehui* or 'middle level of society'. It is remarkable how much the same phenomenon is to be seen in the late 19th and early 20th century India. In fact, there was a daily newspaper in Pune which was called *Kal* the exact synonym of *Shibao*. One does not know if our historiography of the times has addressed itself to the problem of *zhongdeng shehui* as much as Chinese historiography has done. The continuities and the organic unity of the Chinese societies are rarely questioned. In India they usually are.

It is, however, not only the *zhongdeng* part which was important. It was its reformism that led to a lot of significant journalism in the early phase. It was a function of that reformism that the question of "reconciling China's cultural heritage with a new mode of politics, the one with which the late Qing publicists struggled in their editorials" acquired centrality. It is a continuing debate in China. As late as the 80s of this century, Joan Judge points out, intellectuals like Su Wei, for example, recommended "jettisoning the foreign idea of civil society altogether and encourage[d] Chinese intellectuals instead to search for 'new ideological sources' from China's own legacy" (p 203). In that sense the history of early Chinese journalism is the history of creation of ideas which seem to have had a remarkable enduring power in China.

Early Chinese journalism acquired this status not only because it advocated a set of ideas. It also stood by the common people and their struggles against oppressive economic and political policies. An article in *Shibao* published in 1910 made an interesting distinction between rioters (*luanmin*) and rebel bandits (*panzei*). It was customary to dismiss all opposition, often violent, to government policies as rioting of the bandits. In a sense *Shibao* was the first journal to have distinguished between (rebel) rioting and rebel banditry. The most fascinating chapter of the book is the one on 'The Common People's Causes' naturally reflected in *Shibao* (pp 120-39).

This book is divided in three sections. The first section (pp 1-75) discusses the rise of the new middle realm, a reference to which has already been made. The second section discusses the relationship between "the publicists and 'the people' " (pp 79-140). The publicists are presented as the Confucian noble men (*junzi*). These noble men worked on the assumption that "the people could be transformed...from the dependent subjects to the creators of their own destiny" (p 81). It is true, as the author points out, that who the people are was never made clear. The noble men went on articulating and at times shaping the demands and aspirations of the 'people'. These noble men were certain who the 'system' benefited. It was 'corrupt officials' who made "the lives of the people increasingly difficult". Most writers of *Shibao* seem to have taken for granted who the people were or who constituted the people. Joan Judge, however, has not pursued this line of enquiry. The third part discusses the publicists in their role versus the power holders (pp 143-204). This part naturally discusses the role of the press and the 1911-12 revolution in China, easily the most useful and perceptive section of the work.

The book is full of cartoons and illustrations, a major part of any lively journalism. Looking at these cartoons, I often wondered if Indian newspapers (in Indian languages that is) carried such lively cartoons in their pages. Probably not. The art of cartooning is new to India. Political cartooning is even more so. The Chinese calligraphy adds its own charm to the exercise. A good example of the same is the cartoon (dated August 8, 1908) giving us two views of the national assembly [*guohui*] by simply presenting the two characters *guo* and *hui* in thick or light strokes.

On the whole, therefore, this book is a significant addition to the Chinese Studies. It is weak on political analysis because quite often Joan Judge states a position without going into the political implications of the same. The fault must be of the times we live in. The post-modernist world is also a post-political world. Inadvertently, Judge has given a good example of it. In the introduction itself, she identifies Lenin as "the chief Bolshevik agitator" (p 4). Does one need to say more?

Marxism and The Postcolonial World

Footnotes to a Long March

Aditya Nigam

What is it that Marx can still offer us? Why hark back to him and his legacy? Why not abandon him altogether and construct our very own theories? Such queries can be answered by asserting simply, that the major resources that can provide even the starting points of a new emancipatory theory lie within the tradition of Marx. More importantly, just as the 'original Marx' is lost to us, so is the 'pre-marx' era of human thought. This essay attempts to open up the space for a reconstruction of a new emancipatory vision for the 'third world', which cannot but draw heavily on marxism, even if it is marxism reincarnated.

THIS paper is as much about the postcolonial world as it is about marxism. More importantly, it is about the relationship about the two. I use the term 'postcolonial'[1] here to refer to something more than a mere temporal marker – as more than something that comes after the end of colonialism. Rather, it refers to the entire region of the Three Continents[2] since the beginning of its encounter with colonialism, and through it, their encounter with modernity; it therefore points towards that whole range of conditions that mark it out as distinct from the first world – political, economic, psychological and cultural. If colonialism was the dominant agent of modernity in these societies, it was certainly no the only one. A certain marxism, particularly after the Russian revolution of 1917, became a potent force through which the emancipatory ideals of the secular-modern imagination entered this world. And yet there remains a continuous tension between the high discourse of modernity entailed in it and the existential situation of this world, which becomes complicated by the day.

The end of the 20th century marks the end of a gigantic emancipatory project, probably the largest ever in history that was carried out in the name of that marxism, which met its end with the collapse of 'actually existing socialism'. What I will henceforth refer to as 'canonical marxism' represents the demise of a certain vision of freedom, its rapid degeneration into its very obverse – a massive project of social engineering, of trying to fit the whole world into One Past and One Future. In its entirely misplaced effort to efface all difference, it ended up, in the process, effacing itself.[3]

The project of erasing difference began from within. In order to be able to cast the world in the single mould of the vision of the Third International and its inheritors, it was first necessary to erase difference from within its own ranks: its own self had to be reconstituted, in a manner of speaking. What I call the 'footnotes' to marxism are precisely those elements of its self, those currents of thought that comprised its rich variety before the onset of orthodoxy, that were waylaid and pushed to the margins. As a matter of fact, 'footnotes' still have some existence on the page of the text, some visibility within its overall existence. To that extent, the expunged parts of the communist self are more like 'endnotes' – pushed beyond the frontiers of visibility which we can see only after the chapter is closed (or the book?). They are what Javeed Alam has, in the context of the philosophical traditions of modernity, called the 'unembodied surplus' of the tradition [Alam forthcoming]. The communist/marxist self that was expunged and thus pushed outside the text, as it were, has kept reappearing in different ways in different times and places, always keeping the flame alive, though it has occasionally had to disguise itself in conventional modes of appearance. From the council movements of the early decades of the century in Europe, to the various shades of the New Left students' upsurge in the late 1960s, off and on, there has been a revival of some strands of the unorthodox traditions. Even after the collapse, the idea of a communist future continues to survive in very different ways and continues to inspire struggles in large parts of the world, especially the Three Continents, including India.

I do not intend here to recover all the lost voices – the 'endnotes' of marxism – for they were too context-specific and cannot help us in any significant way today, except of course, to highlight to us[4] our own history, to help us understand how one 'self' – the critical self – of marxism was killed. In this essay, I only wish to open up the space for a reconstruction of a new emancipatory vision for the 'third world', which cannot but draw heavily on marxism, even if it is marxism reincarnated. I am aware, in the manner of the Marx of the *Grundrisse* that the search for origins, for the 'real' Marx is a futile one. For one thing, he is inaccessible. For another, the world that has traversed a century and a half since then demands much more than he can offer. After all, it was Marx who constantly reminded us that ideas can never have transhistorical validity; that they arise within given socio-historical contexts and become meaningful within them.

What is it then that Marx can still offer us? Why hark back to him and his legacy? Why not abandon him altogether and construct our very own theories? One can respond to such a query by asserting simply, that the major resources that can provide even the starting points of a new emancipatory theory lie within the tradition of Marx. More importantly, just like the 'original Marx' is lost to us, so is the 'pre-marx' era of human thought. The tradition of Marx permeates the very world we live in and the very air we breathe, to borrow an expression from Castoriadis (1987). Any new vision must therefore be, can only be based on an immanent critique of 'actually existing marxism' and if Marx himself allows us the resources to build that critique, we can only welcome it.

An idea of the unprecedented theoretical and cultural diversity and richness of the tradition can be had from even a cursory look at the various streams of thought that have been influenced and inspired by the vision and the thought of Marx. Kolakowski's majestic *Main Currents of Marxism* provides a glimpse of that tradition. I say 'glimpse' because that account too is incomplete and fails to capture

the developments in the non-western world. Even Kolakowski's otherwise brilliant account that consciously tries to retrieve the lost currents within marxism falls prey to the widely held belief that theorising about Europe and the west is theory while theorising about the backward colonies must form part of some area-specific empirical/practical pursuit ('area studies' in the contemporary academic world). Nevertheless, the volume does give a sense of the ways in which marxism in its youth, as a revolutionary theory/vision was adapting itself to the conditions where it was taking roots, and thus engaging with the complicated variety of the situation.

In this essay, I wish to explore through an investigation of the fate of Marx's doctrine, two inter-related sets of questions. The first set of questions relates to the problem of the specificity of the postcolonial world and the problems of simply 'applying' theory born in the west to conditions so very different. This problem is further complicated, I will argue, because underlying the theory there was always the Eurocentric assumption of the invincibility of the west, thanks to its 'higher level of development'/ 'advanced mode of production' and its being possessed of the magical wand of Science and Reason – that is History (Future History?) embodied. The second set of questions has to do with the ways in which marxism's canonisation itself led to the destruction of the emancipatory potential – both in its theory and in the organisational forms mediating its practice.

Also related to the first set of questions is the entire Indian debate on secularism and modernity. I will not go into that debate here, but suffice it to note that so far it has been framed in terms of the state/community and tradition/modernity dichotomies. While the Indian debate reveals rich insights into the questions at issue, it remains caught within its own terms. So for instance, the entire body of writings deals with secularism (and modernity) being colonial impositions and therefore state-centric – for critics and supporters alike. The question then really hinges on the nature of colonial interventions in Indian society. Many critics of secularism would argue that the fact of colonial imposition should alert us to its inherent limitations, while many secularists have been arguing that as the colonial state merely built on processes (and resources) within precolonial society, it did not really introduce a fundamental rupture. I shall merely point out here that there was at least one more route through which the secular-modern imaginary entered societies like India's: this was the route of marxism which had neither the burden of the state nor the colonial legacy to shoulder and which should therefore have made it different in its approach form that other secularism. As it happens, the fate of left-secularism and state-secularism actually converged as the going became tough. This, I will argue, had something to do with the profound rupture – an epistemic rupture – introduced by the canonised versions of marxism.[5]

There is one more problem that lies somewhere between the first and the second. Marxism travelled eastwards through the agency of the Comintern – the codified canon embodied – or through its constituent 'sections' like the Communist Party of Great Britain (CPGB), in the case of countries like India. There is therefore, a complicated dynamic in the way the first problem is itself mediated by the second circumstance. One of the problems of 'applying theory' in this fashion is that not merely the cultural but also the politico-historical context and specificity of the countries where the 'application' is intended gets ignored. What happens if the application is undertaken through the mediation of a highly centralised and rigid structure like the Comintern, therefore, will form a part of the following discussion.

I

On the 150th anniversary of *The Communist Manifesto*, there is a fundamental question that needs to be asked. In order to pose the question I will first quote a passage from one Tricontinental marxist:

> In a book published by the Argentine historian Gustavo Beyhaut concerning the problem of race in Latin America, for example, we find a number of interesting references to Engels among others. In an article published on January 23, 1848 in the *Deutsche Zeitung* and another published in February 1849 in the *New Zeitung*, Engles discusses the war of 1847 between the United States and Mexico. He refers quite unambiguously, to the positive character of American expansion in Mexico, insofar as it represents the expansion of an advanced civilisation...This could be extended even, let us say, to cover Vietnam a cen ury later [Abdel-Malek 1981].

Abdel-Malek's ironic remark pointing to the fact that a century later the same could under no circumstances be extended to Vietnam says something about the profound change, the radical alteration of the terms of discourse that had already taken place in marxism during the intervening century. Was this simply because the nature of capitalism's expansion underwent a qualitative change with the appearance of imperialism? Or was it the case that with the appearance of Lenin's *Imperialism, The Highest Stage of Capitalism*, the basis was laid for the complete transformation of marxist discourse? There are any number of quotations that can be marshalled from the writings of the founders of marxism and Abdel-Malek (1981:81-82) has furnished some of them to show how 19th century marxism shared a common ground with Orientalist discourse – in fact was largely located within it.[6] What is relatively uninvestigated is the transformation referred to above.

In 1848, *The Communist Manifesto* proclaimed:

> The bourgeoisie has subjected the country to the rule of the towns. It has created enormous cities, has greatly increased urban population as compared with the rural, and has thus rescued a considerable part of the population from the idiocy of rural life. Just as it made the country dependent on the towns, so it has made barbarian and semi-barbarian countries dependent on the civilised ones, nations of peasants on the nations of bourgeois, the east on the west" [Marx and Engels 1982:39].

Notice that the terms 'rural population', 'country' 'barbaric and semi-barbaric countries' and the 'east' are all analogous categories – repositories of idiocy (the lack of Reason?), embodiments of a past that was unproblematically and unadulteratedly 'barbaric', which often enough, it undoubtedly was. Since then, things have changed significantly, so that today, if at all marxism survives it does so in the Three Continents. Its long march has traversed not merely one and a half centuries, it has moved from the west where it was born, to the east which it saw as the habitat of the barbarians and the irrational, and where it found its most enduring residence.[7]

If in the 1990s, the only hope of all shades of marxists resides in the Three Continents, I shall suggest, once again taking the cue from Abdel-Malek, that what happened in this period to marxist theory, crucially, was the displacement of the historical/economic determinist problematic and the centrality acquired by the 'specificity of the political'. If the celebratory tone of the *Manifesto* was predicated upon the 'higher technological and cultural/civilisational levels' of capitalism (that made it the 'unconscious tool of history'), the Leninist-Maoist moment of marxism's development privileged the

political – the revolutionary potential of the oppressed peoples and the peasantry of the colonial world and, in its later form, of the 'third world'. There are major tensions on this point in the writings of Lenin, whose initial faith rested on the west and subsequent to the October revolution, specifically on the European proletariat which would be the standard-bearer of world revolution. We shall encounter some of these later in the discussion. The Maoist movement, on the other hand, in the enunciation of the contradiction between 'national liberation struggles and imperialism' as the central and focal contradiction of the epoch, (at the time of the Great Proletarian Cultural Revolution), represents the complete displacement of the economistic problematic. The fact that the Chinese people were 'poor and blank' became the virtue, the source of their revolutionary energy. The subsequent, completely bizarre form in which this expressed itself in the so-called Three-Worlds Theory, also represents to an extent the extension of the same dynamic – though that has a lot to do with the specific nature of power-struggle within China and externally, with China's battle for supremacy within the international communist movement with the Soviet Union. The populism of the postulate of the 'convergence of interests of the US and the USSR' was probably meant to rally the movements in the Three Continents with pure rhetoric, unable as China was to compete with the USSR in supplying arms to them. That should not however detract us from assessing the theoretical significance of that rhetoric. Nor need that lead us to any concession in assessing the disaster that was the Cultural Revolution.

II

A Methodological Detour

Before going into the specific substantive issues of the problem, it is necessary to clear certain methodological points straightaway. From within the writings of Marx, it is possible to sift out passages and quotations supporting different methodological standpoints – from the extreme historicism and humanism of a Lukacs to the extreme anti-historicism, anti-humanism and structuralism of an Althusser; from the economism/economic determinism of the Second International and Stalin to the 'politics in command' of a Mao Zedong. As I indicated in the beginning, it is not possible to extricate 'the real Marx' from this bewildering array of interpretations. Since we always read texts from our own specific historical locations, it is simply necessary to specify my Marx. As will be seen, this Marx is closer to and influenced by Althusser's though, in some respects, very different. My main difference with Althusser here is that unlike him I do not consider the search for an authentic moment in Marx either fruitful or valid. There cannot be a neat periodisation that says that after one particular point there is a scientific and mature Marx, who alone we can look up to.

In the famous 1857 *Introduction*, subsequently published in the *Grundrisse*, Marx conducts an elaborate discussion on the 'method of political economy'. He says,

> Bourgeois society is the most developed and the most complex organisation of production. The categories which express its relations, the comprehension of its structure, thereby also allow insights into the structure and relations of production of all the vanished social formations out of whose ruins it built itself up, whose partly still unconquered remnants are carried along within it, whose mere nuances have developed explicit significance within it...*Human anatomy contains a key to the anatomy of the ape*. The intimations of higher development among the subordinate animal species, however, *can be understood only after the higher development is already known*. The bourgeois economy supplies the key to the ancient...But not in the manner of those economists who smudge over all historical differences and see bourgeois relations in all forms of society. One can understand tribute, tithe, etc., if one is acquainted with ground rent, but one must not identify them... [Marx 1973:105] (emphasis added)
>
> It would therefore, be unfeasible and wrong to let the economic categories follow one another in the same sequence as that in which they were historically decisive. Their sequence is determined, rather, *by their relation to one another in modern bourgeois society, which is precisely the opposite of that which seems to be their natural order*...[ibid:107] (emphasis added)

This is the premise that informs much of the *Grundrisse* and much later, Marx remarks once again that, "(I)n order to develop the laws of bourgeois economy...it is not necessary to write the real history of the relations of production" [ibid:460]. What Marx underlines here is that the past is always available only through the present: that it is only through the categories of thought produced in the present, through the language we inhabit that we can really make sense of the 'facts' that constitute the past. That therefore, the possibility of return to the origins is not only historically closed, it is also epistemologically absent. To elaborate, Marx is here anticipating the postmodernist/poststructuralist thesis that there is therefore a radical uncertainty about the past ('the myth of origin') for there will be as many pasts as there are presents; that at every turn of the present we rediscover and reconstruct our narratives of the past. The present, however, Marx himself tells us, is never available as Truth, for there is always the 'truth' of the proletariat against the 'truth' of the bourgeoisie. To a certain Marx of the 19th century, this problem of truth is resolved through the resort to a metaphysical teleology: the proletariat as the embodiment of the truth of universal history. If that recourse is not possible to our Marx, the problem of truth is destined to remain unresolved. There are bound to be contending claims of truth and correspondingly, contending constructions of the past. This is true as much of Marx himself for this way of reading Marx is also possible only in this present – the present of the decline of certainties of the universalist discourses of the past.

If the impossibility of knowing the past from an archimedean point was already evident to Marx, why did he not push his point further and become the first postmodernist? Marx himself would probably forbid such a question but let us venture a guess. It is interesting to see that he was aware of some of the uses to which his argument could have been put and grapples painfully with the possibility in later passages. Having demolished in no uncertain terms what Althusser would call 'the historicist fallacy', he is faced with the following dilemma: In the context of bourgeois society, would he not, even if by default, be playing into the hands of (the arguments of) bourgeois economists who considered its categories (and bourgeois economy itself) as eternal/natural? This is how he poses the question:

> Although it is true...that the categories of bourgeois economics possess a truth for all other forms of society, this is to be taken with a grain of salt. They contain them in a developed or stunted, or caricatured form, etc, *but always with an essential difference*. The so-called historical presentation of development is founded,...on the fact that the latest form regards the previous ones as steps leading up to itself, and since it is only rarely and only in quite specific conditions able to criticise itself...it always conceives them one-sidedly. The Christian religion was able to be of assistance in reaching an objective of earlier mythologies *only when it own self-criticism had been accomplished to a certain degree*...Likwise,

bourgeois economics arrived at an understanding of feudal, ancient, oriental economics *only after the self-criticism of bourgeois society had begun* [ibid:106]. (emphasis added)

The tension is evident: it is true that bourgeois economics holds a truth for all other forms, but how can that be? It must therefore be with an essential difference. Yet, is that the tension? Probably not. More likely, it is a tension between the Marx of our reading and the other Marx – the seeker of truth. There is therefore a conflation of two orders of truth. In the very first sentence of the passage, 'it is true' refers to a historical/contextual/contingent truth but in the same sentence, the reference that these categories possess "a truth for all other forms of society", appears as an eternal, transcendental truth that his own reflections show to be impossible. That is why he has to clumsily state that this is revealed in a one-sided and caricatured form.

The last passage however also reveals to us an important but relatively untheorised category of Marx that is of central importance in the production of knowledge. This is the categoryof 'self-criticism' or what can also be called the immanent critique What precisely is this 'self-criticism' and what does it help reveal? Surely this self-criticism cannot mean that suddenly, one fine day, Christianity or bourgeois economics became (through some change of heart?) more self-reflexive It makes more sense to see this self-criticism as the breakdown of the hegemonic discourse within which past forms had been constituted in specific ways that justified the hegemony of the hegemonic forces. If Christianity or bourgeois economics had to make room for accommodating more empathetic ways of understanding paganism or pre-bourgeois forms, it was precisely because of this breakdown of their hegemony. Charateristically, it is in these moments of break that spaces are created for re-assessing/re-apprehending objects/forms/categories rendered invisible by the structure of the hegemonic discourse

Now, what applies to the discourse of Christianity or bourgeois economics, must apply equally to any discourse including Marx's own, which in its subsequent transformations, became as theologically rigid as say, Christianity. I am especially thinking of the marxism of the Second and Third Internationals It must equally importantly, apply to the discourse of the Enlightenment, in which Marxism constituted a moment of self criticism. The present conjuncture, that of the postsoviet world and the collapse of the hegemony of canonical marxism and of Enlightenment discourse affords us precisely the opportunities of reconstituting the premodern/pre-capitalist forms within the new discourse of 'self-criticism'. Since every negation is always-already an affirmation, let there be no illusion that this self-criticism of the postmodern conjuncture would not also be bound to be predicated upon a series of repressions – of certainties of universalism, of self-transparent/transcendental subjectivities, of the search for origins, to name a few.

III

In 1848, when the *Manifesto* was published, the west was the centre of the world and the world revolution, and the east figured in the document – as in many other pronouncements of the founders of marxism – as a mere remnant of the past. I have already quoted some of the relevant passages above. Not only are they steeped in Orientalist common sense, they are also fully in line with the metaphor of darkness and light that is the central organising principle of the Enlightenment. I have however quoted these passages not to say that Marx was an Orientalist or racist. The point is precisely the reverse: Even for a revolutionary like Marx, it was not possible to apprehend these forms/formations by stepping outside the discursive horizon of his times.[8] What were different societies, different cultural configurations located outside the physical space of the Enlightenment, became transformed and constituted as temporally prior – as relics of the past whose dissolution had to be welcomed as they represented backwardness. The east was backward because of its superstitious beliefs in religion, magic, sorcery and the like; never mind if mathematics, print technology and gun powder the three major powers of modernity and colonialism were discovered/invented in the east. It had to wait for the west to civilise it, to bring it to light.

Fernando Claudin (1975) has, in his studied and extremely well documented account of the Communist movement, pointed to the degeneration of the marxist doctrine under Stalin. He has shown how, in country after country, it was the needs of the Soviet state and Stalin, that were responsible for turning the defence of marxism and the internal revolutionary struggles into a subordinate position to the defence of the Centre of World Revolution. This centre, according to him was once the Comintern that had already become the instrument of Soviet foreign policy interests but the problem was that even that entailed some mediatory forms like consultations with leaders of some of the important parties, particularly those who were represented in the executive committee of the Comintern (ECCI). Claudin argues convincingly that it was the need to do away with these minimum impediments to the complete annexation of the communist movements in different countries to Soviet interests that led to the Comintern's dissolution and its replacement by the Soviet state as the new centre. Claudin argues here as a marxist and his argument is radically different from the type of cold war writings that were once the staple of western marxology.

In the history of the Comintern, he shows how the problematic category of the 'east' appeared as a crucial one through successive struggles within. He shows that Lenin himself was till as late as 1912, a European at heart. In his article on the 'Awakening of Asia', written in the wake of Sun Yatsen's revolution in China, Lenin wrote welcoming the revolution:

> Does that mean ..that the materialist west has hopelessly decayed and that the light shines only from the mystic, religious east? No, quite the opposite It means that the east has definitely taken the western path, that new hundreds of millions of people will from now on share in the struggle for the ideals which the west has already worked out for itself" [Claudin 1975:50]

There is a long history to the way in which Lenin came to reappraise the situation and theorise the rise of imperialism, especially after the revolution and the formation of the Comintern, when he actually had to deal with the question of the 'backward nationalities' within Soviet Union and in the world at large. Much of that history is well documented and need not be recounted here. I shall merely recount some of the telling instances below. Claudin's account clearly maps the changes in the attitude of the Comintern. He claims that the First Congress almost completely ignored the question of the colonies and

> expressed very clearly the traditional ideas that were strongly rooted in the minds of the marxists: 'The emancipation of the colonies is possible only in conjunction with the emancipation of the metropolitan working class. The workers and peasants not only of Annam, Algiers and Bengal, but also of Persia and Armenia, will gain the opportunity of independent existence *only when the workers of England and France have overthrown Lloyd George and Clemenceau...*' [Claudin 1975:246]. (emphasis added)

Claudin argues that three things happened between the First and the Second Congresses that put the 'national and colonial question' on the agenda. First, the ebbing of the proletarian revolutionary tide in the west. Second the upsurge in the colonies and third, the sharp rise of the national and colonial question inside the Soviet Union [ibid].

The Second Congress, which was attended by many delegates from the colonies, saw the almost complete reversal of the above position in the stand taken by these representatives like M N Roy. Claudin quotes the report of the Congress Commission on the National and Colonial Question, which said that "Comrade Roy defends the idea that the fate of the revolutionary movement in Europe depends entirely on the course of the revolution in the east" [ibid:247]. Roy was, of course, basing his argument on the idea that as long as the imperialist powers continued to extract super-profits from the colonies they would never enter into a terminal crisis of capitalism. Lenin countered Roy by referring to the fact that "(I)n spite of the fact that the proletariat in India numbers five million and there are 37 million landless peasants, the Indian communists have not succeeded in creating a communist party.. *This fact alone shows that Com. Roy's views are to a large extent unfounded*" (emphasis added) [ibid-248] Clearly Lenin was hitting below the belt by putting forward this entirely non-theoretical argument. This fact really showed nothing so far as the question at issue was concerned.

The Third Congress, held a year later, completely bypassed the issue due to certain strategic requirements of the USSR I will not go into the details of these requirements but suffice it to note that Roy had to protest against it while making his report on India, where the mass movement was reaching unprecedented heights. I quote: "I have been allowed five minutes for my report. As this theme cannot be dealt with adequately even in an hour, I wish to employ these five minutes for an energetic protest." He went on to remark that "the way in which the eastern question has been dealt with at this Congress is purely opportunist and is worthy rather of a Congress of the Second International."[9] In the Fifth Congress, the issue was raised forcefully by the Japanese Communist Party delegate Sen Katayama and Ho Chi Minh (then Nguyen Ai Quoc).

It is interesting in this context, to note that at the Fourth Congress, Tan Malaka of the Indonesian CP narrated the story of the CP's collaboration with an oragani-sation called the Sarekat Islam. He said:

> ...We collaborate with the Islamists... Between 1912 and 1916, this union had one million members, perhaps it had three or even four million. It was a very large proletarian union which sprang up spontaneously and was very revolutionary. Until 1920 we collaborated with this union...In 1921 we succeeded in making Sarekat Islam adopt our programme and it went into the villages agitating for control of production and for the watchword: 'All power to the poor peasants and to the proletariat. However, a split occurred in 1921, owing to the tactless criticism of the leaders of the Sarekat Islam. The government and its agents made use of this split, and also of the decisions of the Second Congress of the Comintern, to fight against Pan-Islamism.

In the midst of this narration Marchlewski, who was at the Chair, interrupted: "Your time is up". To this Malaka replied, "I have come from India, it took me 40 days to come here" and continued amidst applause, to express what can only be described as the most crucial existential crisis of a communist of the colonial world: "*they (the Sarekat Islamists) are with us 'with their stomach' (to use a popular expression) but with their hearts they remain with the Sarekat Islam – with their heaven which we cannot give them.*"(emphasis added) [Claudin 1975:Note 87, Chapter 4]

If this was the situation in the colonies in the rest of the world, the situation inside the USSR was no different – in fact, it was more complicated. Claudin writes of the Muslim peoples of central Asia: "Tsarist colonisation had taken in these regions...an 'Algerian' form: settlement by Russian colonists [peasants and also some workers], who inevitably acquired a colonialist mentality. When Bolshevik power was established in the heartland of Russia, this Russian minority...at once became 'Soviet' and from its ranks were recruited many of the 'Bolsheviks' who were to take over the leading functions in the new institutions." In 1920, Lenin sent one of his closest collaborators, Safarov, to study the problem and Claudin remarks that Safarov was to write some years later tnat.

> It was inevitable that the Russian revolution should have a colonialist character in Turkestan. The Turkestani working class, numerically small, had neither leader, programme, party nor revolutionary tradition.. Under Tsarist colonialism, it was the privilege of the Russians to belong to the industrial proletariat. For this reason, *the dictatorship of the proletariat took on a typically colonalist character* [Claudin 1975:256-57]

At the famous Baku Congress of the Peoples of the East, Narbutabekov from Turkestan made the following impassioned plea:

> We...have faith in our ..leaders of the world proletariat – comrades Lenin, Trotsky, Zinoviev and others, but all the same we must state...what we want, and the voice of the Muslim workers and the peoples of the east must be heard...Everyone knows that the east is utterly different from the west and its interests are different – thus, rigid application of the ideas of Communism will meet with resistance in the east...They [the leaders] should come and see for themselves what is happening in *our country*, what exactly the local authorities, whose policies drive the working masses away from the Soviet power, are up to...(I)n shedding our blood on the Turkestan fronts against the enemies of Soviet power, we bound up our lives closely with the working masses of the whole of Russia and *the accusations of chauvinist tendencies made against Turkestani leaders must be dropped*. I tell you comrades, that our Turkestani masses have to fight on two fronts. On the one hand, against the evil mullahs at home, and *on the other against the narrow nationalist inclinations* of local Europeans (emphasis added) [ibid: Note 85, chapter 4].

Notice the use of terms like 'our country' and 'local Europeans'. Notice also the fact that already the complexity of conflict between local cultures and high theory was being played out - the latter talking the language of universalism while the former were asserting their ineradicable difference. In fact, Narbutaketov's speech shows how their idea of universalism was predicated precisely on the recognition of difference – otherwise the fear was that in the name of universalism, local European nationalism would ride roughshod over them. Hence, the fight on two fronts. Between him and Tan Malaka, we see the really repressed voices of marxism, the traces of which we would find difficult to retrieve. The long history of marxism's sojourn in the east in fact, can be seen as one of continuous struggle between these two imperatives, between the dictates of a theory which talked an abstract language but was steeped in European traditions and therefore dismissive of other traditions and, the imperatives of making their own revolution which could not afford to adopt an instrumentalist attitude, let alone be self-depreccatory about their own cultures.

Most of the time however, as Abdel-Malek (1981:86) rightly observes, the communists from the colonies "were less concerned to expound theses than to say: we exis ."[10] To some extent, Roy did try

to theorise but then, in his theoretical predelictions he was more European than most other colonial marxists. His theorisations therefore, were mainly confined to asserting the importance of the eastern question and to demonstrate that it could not be made politically subordinate to the tasks of the communists in the west. Of all the Tricontinental marxists, it was Mao Tsetung who went furthest in his effort to theorise though, as we shall see these efforts too fell far short of the requirements. It may be useful then to look at some of his forays into theory.

IV

Three concepts seem to be of crucial importance to Mao Tsetung's attempt at dealing with the application of marxism's predominantly European theoretical paraphernalia and the rigid imposition of the Comintern's code. First, the 'law of uneven development' as an absolute law. 'Nothing in the world develops absolutely evenly', he proclaims [Mao Tsetung 1997: Vol I, p 336] Through this assertion, Mao in an almost instinctive fashion subverts the metaphysical positivist desire of finding laws and regularities governing human societies – much of which baggage marxism had itself inherited through the Second and the Third Internationals. Second, he makes what is his central conceptual move through his enunciation of the 'particularity and universality of contradiction'. The universality of the contradiction is simply the idea that 'contradiction exists in the development of all things'; that 'it is precisely in the particularity of the contradiction that the universality resides' [Mao Tsetung 1977: Vol I, p 316]. Universality, says Mao, is easier to understand because 'it has been widely recognised' since Marx, Engels, Lenin and Stalin, but "the particularity of contradiction is still not clearly understood by many comrades, especially the dogmatists."[10]

Notice here the second major subversion: If universality of contradiction was to a certain marxism, the universal appearing, *a la* a certain marxist Hegel,[11] in each particular and each particular representing a mere moment of the universal, Mao in one stroke, completely reverses its meaning. The particular now becomes the only way in which the universal can appear. This is Mao's famous law of contradiction. This notion is the second universal truth. The two statements together constitute what Mao calls 'the universal truths' of Marxism, thus holding on the idea in words but interpreting it in a way that practically denies it. In his rendering then, this is universality, but one which has no attribute of its own; it acquires everywhere the attributes of the particularity. That is why Mao can ask: "Why is it that the Chinese revolution can avoid a capitalist future and be directly linked with socialism, without taking the old historical road of western countries..?" and answer: "The sole reason is the concrete conditions of the time" [Mao Tsetung 1977: Vol I, p 341].

By making these moves Mao is further able to complicate notions of subjectivity and agency handed down by the internationals. Contradictions exist, according to him, not only between the exploiters and the exploited, but equally importantly, 'among the people'. In the concrete conditions of China, he refers to "contradictions within the working class, contradictions within the peasantry, the contradictions within the intelligentsia, the contradictions between the working class and the peasantry", etc [Mao Tsetung 1977: Vol V, p 385].

It is true that Mao never theoretically follows through and works out the ideas of subjectivity and agency in the light of these formulations but all through his practice we can see that he is acutely aware of the implications of the above. It is easy to see that, put this way, simplistic notions like a 'class-in-itself' turning into a 'class-for-itself' – another specifically 19th century Europeanism – become impossible to conceive. For, having already posited the contradiction within the class, it is neither possible to simply derive class consciousness from class position, nor think of a single unified will of a class – expressed through a single party. Needless to say, attributing a 'telos' of History to that is well-nigh impossible.

In case we had any doubts, Mao goes further. True, he does put 'contradictions among the people' in the category of 'non-antagonistic contradictions' as opposed to 'antagonistic' ones among the exploiters and the exploited. Yet, these are not fixed categories which can only be resolved in one particular way, consonant with the larger telos. So he argues that one can easily turn into the other. "(T)his contradiction between the two classes (the national bourgeoisie and the working class), if properly handled can be transformed into a non-antagonistic one and be resolved by peaceful methods" [Mao Tsetung 1977: Vol V, p 386]. On the other hand, "(I)n ordinary circumstances, contradictions among the people are not antagonistic...but if they are not handled properly...antagonism may arise" [Mao Tsetung 1977: Vol V, p 391].

The phrase 'if handled properly' then leads us to the third concept of Mao's: politics in command. Nothing but the limiting conditions are provided by the economy and the logic of production. The rest depends upon politics, upon how forces are rallied, how alliances are struck, how struggles are conducted and what organisational forms mediate each of these.

We must however, be cautious while understanding the use to which Mao puts these concepts. He wanted to puncture the rigidly structured and codified canon of the Comintern and create the space for his own activity. The political task of accomplishing the Chinese revolution demanded a partial rejection of that canon but in the balance of world forces then existing he could not afford to become another Tito – excommunicated by the communist world. It was to create this space that the idea of a particularity that not just expressed the essence of the universal but was an entity in its own right, becme important. The theoretical/philosophical task that followed from Mao's initiative, at once bolder and more conservative than Lenin's, was never undertaken, either by him or by his successors. In many ways therefore, Mao remained a believer in 'the universal truths of Marxism-Leninism' even though he often enough chose to define them in the above manner. Today, we surely can read these conceptual moves made by him in a more radical way.

This caution is necessary in order to understand that because the theoretical/philosophical implications were never followed through into an alternative theorisation of the specificities of the colonial world/east, marxism even its Maoist incarnation, remained within the larger framework of post-Enlightenment, often positivist, thought. It was therefore easy for it to slip back into the canon and in the case of China, into the high modernist paradigm that rules it in the post-Mao phase.

It is important therefore to underline here that to create a space for a different practice and an alternative theorisation is no substitute for an alternative theory. In order to accomplish that latter task, a further step is required: It is not enough to say that 'our history' is different from theirs; we must move towards a reconstruction of this history on its own terms. However, that is not our concern in the present essay, but I wish to state here that when I say 'on its own terms' it is not once again a search for the pristine, precolonial histories that I am suggesting. Nor am I suggesting that all responses of the nationalist leaders and intelligentsia to colonial

modernity that were based on some sort of dialogue with it, were a priori illegitimate. The search, on the contrary, must be based on an effort to understand why they related to colonialism in the way that they did.

In this section I will briefly look at the formative history of the Indian communist movement, which presents an interesting counterpoint to the Chinese case, for it is a movement that remains essentially hegemonised by the Comintern and the classical paradigm. Yet, in a peculiar way Indian communism too reveals the existential angst of other colonial communists.

It needs to be underlined that by the time marxism came to India, it had already undergone its first major metamorphosis. To the hundreds of youth who joined the communist movement in the country in the second and third decades of this century, marxism was an anti-imperialist doctrine of liberation from colonialism. That much was already self-evident. Its hostility to colonialism was a logical extension of it hostility to capitalism as such. On this issue eastern marxism did not seem to suffer from any internal contradiction Many of the youth who felt attracted towards the communist movement were nationalists to begin with, driven by a passion for a new, free India. Others were believers in Islam and anti-British, who wanted to fight for the Khilafat. For many of them though, their religiosity does not seem to have been articulated with their nationalism. These are points that are often overlooked when, all too easily the communists today are accused of having been the carriers of an alienated, western oriented way of thinking. There seem to be many more layers of complication than are visible at first sight, as we shall see later There was certainly something internal to communism too, that happened in later years that also transformed Indian communism to its subsequent alienated form.

The first generation of Muslim youth who went and joined M N Roy and became the co-founders of the communist party in Tahskent, were in fact 'muhajirs' – self-exiled or on 'hijrat' Roy writes of them that 'they were not even nationalists'. He then goes on to add:

> My preliminary efforts with the educated minority produced *greater results than I expected and wanted* Most of them *transferred their fanatical allegiance from Islam to Communism*(emphasis added). I had not spoken to them at all about Communism. I had only told them that driving the British out of India would be no revolution, if it was succeeded by replacing foreign exploiters by native ones. I had to explain the social significance of a revolution: that, to be worthwhile, a revolution should liberate the toiling masses of India from their present economic position. Instinctively idealists, they readily agreed with my opinion and jumped to the conclusion that if the revolution had to liberate the toiling masses, it would have to be a Communist revolution [Roy 1984:464].

Note the significant expession here: The mohajirs 'transferred their allegiance to communism'. Let us just dwell on this for a moment. What had Roy expected and wanted from fanatical religious youth who, he was convinced were not even nationalists? All that he did was to explain to them that merely driving the British out would amount to nothing unless the toiling people were liberated from their exploited position. From this the mohajir youth concluded that this could only be through a communist revolution. Something is clearly missing from Roy's account. That the idea of a communist revolution was in the air; it was there already in the stories that were told in hushed tones, that narrated how the hated landowners and rulers had been overthrown in Russia, led by a larger-than-life messiah called Lenin. Only further scholarship can reveal the extent to which the story of the revolution was acquiring a mythological character. One thing seems certain: the stories of these early years did not yet reveal communism to be a godless, irreligious creed. And for the believers of Islam, to whom the world – the Creation – was greater than any nation, the idea of a revolution that sought to transcend national boundaries may have really seemed very attractive. How else do we make sense of the wholesale transfer of allegiance that Roy talks of? The story of Tan Malaka, of the initial collaboration between the Sarekat Islam and the communists, the tale of Narbutabekov – all of them point in the direction of a conclusion that at least in the early years, conversion to communism did not involve anything more than the adoption of a new political vision of how to recast the world. It certainly did not entail the epistemological rupture, the abandonment of old ways of making sense of the world and the adoption of the standpoint of High Rationalism.

If this was the frame of mind of the muhajir-turned-communists, those at home were not from 'western educated elite' either. Muzaffar Ahmed, one of the founders of the CPI at home, has described his own situation in his pre-communist days, in his autobiography:

> I would be suppressing the truth if I were to say that I was never involved in anything communal. I used to participate in meetings and organisations raising the specific demands of Muslims. I was also a religious Muslim at that time. Even if I did not offer namaz five times a day, I did fast throughout the entire month of Ramzan [Ahmed 1981:7].

In fact, Muzaffar Ahmed further explains that later, during the 1920s, given his "the state of mind... and the thrill that was associated with the terrorist movement" it was not entirely impossible that he joined a terrorist revolutionary group.

> But there were major hurdles in the way. The terrorist revolutionaries drew their inspiration from Bankimchandra's *'Anandamath'*. This book was full of communal hatred from the beginning to the end. Its basic mantra was the song Bandemataram... How could a monotheistic Islamic youth recite this mantra? [ibid:9].

Ahmed says this even as he records his deepest respect for the terrorists (this is the term he consciously uses). Notice here that even though the monotheistic Muslim youth found it difficult to chant the Hindu mantra, he did eventually become a communist subsequently – Islam did not stand in the way. I suspect that for leaders and political activists like him, communism would have been the first station in the route to Rationalism and atheism.

Saroj Mukherjee, one of the stalwarts of the Bengal communists who joined the CPI in the thirties, also begins his autobiography with the concerns that animated some of the youth who joined the communist movement at that time.

> We wanted the freedom of the country. We wanted to usher in an arrangement wherein the people could live in happiness after driving out the British rulers. In what misery do the workers, peasants, the people of the villages and industrial areas live! We wanted an end to that state of affairs and to build a happy and prosperous country...This was the thought that we were obsessed with [Mukhopadhyay 1985: Vol I, p 7]

Clearly, the concerns that brought these youth of diverse persuasions to the communist movement were similar. They were nationalists in a different way – in the sense that they wanted the happiness of the people who constituted the majority of the 'nation', namely, the poor, toilng people. Their nationalism had nothing to with any prior 'Indian essence'. And a precondition to this happiness was the

freedom from foreign rule. Alternatively, they were religiousy inclined 'internationalists' - the Khilafatists - who once again wanted the 'revolution of the toiling masses' and therefore managed to free themselves of the narrow religious concerns for the sake of the larger cause. In other words, to them also, their Islamic allegiance presented no barrier in the transition to communism

How do we understand this transformation – an epistemological leap – from nationalism/religiosity to communism? I would suggest that in the early years, the transition from nationalism and religion did not involve any rupture. The rupture is located precisely in the transition from communism to Rationalism. As a political imaginary, communism provided the buffer between two worlds: as a self-proclaimed weltanschauung, it became the agent of High Reason and of the ideology of Progress.[12] For the moment I shall use 'communism' (with lower case c) to denote the former and 'Communism' (with capital C) to denote the philosophy.

I do not think that the straightforward dichotomy of tradition/modernity is very helpful here. For, as late as the turn of the 20th century, colonial modernity was already the condition of existence and everything, nationalism and religion included, was marked by its presence. There was no longer any 'innocent precolonial self' in existence any more. And yet there is a crucial leap involved here The communist (that is, pre-Communist) ideas of nationalism and religiosity were deeply engaged in a dialogue with tradition and the past. In a manner of speaking, they represented attempts to cope with colonial modernity from within the ground of a tradition that was already ineradicably lodged within it and therefore conditioned by it The rupture or leap to Communism meant a closure of that dialogue – a move to a ground that was firmly located within the epistemological world of western, post-Enlightenment rationalism. The communists in India, probably, did not just encounter the shift in the Comintern's position that Tan Malaka had experienced with all his being. To them the exciting story of the workers' revolution in Russia presented a picture that was very different from the one that the 'backward peoples' of Turkestan and Soviet central Asia were beginning to experience. The meaning of the revolution was differently felt within and without I am not suggesting that to the people of Soviet central Asia the revolution brought only disaster. Far from it. I am only suggesting that the different story that was beginning to unfold there was at that time not accessible to those who later became communists in India. To them the dream of a happy, prosperous and exploitation-free nation was at hand and the USSR showed them the way to it. Since the question of Pan-Islamism had already been 'resolved' by the comintern, to the Indian communists it – and the religious question in general – was already handed down as received wisdom, unlike Malaka, for whom it remained an open question having the backing of a different experience. The leap for the Indian communists therefore, was one into this worldview – not the one being defended by Malaka or Narbutabekov. How this leap became possible is a matter of further research and investigation.

I will tentatively suggest that a part of the explanation may be rooted in the ontological condition of the colonial subject – a condition shaped by a colonial modernity that was both oppressor as well as the mirror that revealed to him/her the pathologies of the precolonial past. It is within that general ontological condition that we can situate the immense appeal of a modern emancipatory project like socialism or communism which simultaneously declared its hostility to colonialism/imperialism and to the oppressions of the past. It is probably within this larger canvas that the transition to the comintern-led communism becomes possible, even though the actualisation of that possibility is a more complex process

According to Tunisian writer Albert Memmi (1965), the constitution of colonial subjectivity is marked by (a) the social and historical mutilation of the colonised and (b) what I will call after him, her cultural schizophrenia. He delineates two moments of the constitution of this subject, when he talks of two historically possible ways of realising this subjectivity. The first moment of this constitution is mimetic, for the colonised native here mimics and emulates the colonial master. For Memmi, of course, the mimicry is of a different kind, taking place as it does in the violent context of the assimilation of colonised populations under French colonialism. This may also happen, I will suggest, by way of the colonised subject defining her political project of emancipation in terms of the larger theoretical and epistemological criteria of the west, in terms of its philosophy and its achievements as the embodiment of progress and modernity – what Partha Chatterjee has called the Thematic of nationalism. It may also happen in a second, more subtle way of the native/colonised subject recasting her/his own religious/spiritual apparatus in order to summon it to provide the ethical and therefore epistemic, justifications for redefinitions of Selfhood and enable it to play a new political role.

The second moment of this constitution is actually already beginning to emerge in the above description – that of the assertion of their difference. For, this could never be based on the complete rejection of the Self. Even the former category of responses, represented by the modernists who celebrated the idea of the eventual triumph of Reason and Science, were responses from the same ground as that of those who seemed to entirely reject the west. What attracted them to ideas of socialism/liberalism was the idea of a modern India that was not merely politically independent but also free of social oppression. Where the two differed and parted ways was the way in which they assessed the strengths of the colonial power and what they considered crucial to their sense of Selfhood – in other words, what they considered the indispensable and the relatively discardable aspects of their tradition. For those who privileged the west's achievements in material, scientific and modern terms, the road to salvation lay to a large extent, in the first option pointed out by Memmi. The communists clearly, would fall in this category On the other hand, those who thought that the west's political and armed might was the key to its strength, also sought to masculinise and militarise their own 'religion' (like a Vivekananda or in a different way, a Savarkar or a Golwalkar), while holding on to the notion that it was still spiritually superior to the Europeans The reasons why different social groups and sections made different choices have deeper historical reasons, which we can hardly go into here. Suffice it to note that there was no essential Indian Self and different people understood their 'Indianness' in radically different ways. One of the key mediating factors was the attitude the players held towards the violence and oppression of the old order and the stake each of them had in precolonial social arrangements. The caste oppression of the brahminical order for instance, ensured that the entire range of backward caste and dalit leaders did not take the second option. To them the old order was an unmitigated evil that had to go. This circumstance itself was what made all the difference. In Europe and the west, the ideas of the philosophes of the Enlightenment were rooted in the struggles within their respective societies and so the choice was a more straightforward one between the old and the new. In India and much of the colonial world, the rejections of past

violences went along with the need to redefine the Self in relation to a set of new ideas that were tied to the west that was actually colonising it.

In the context of Indian communism, it is this that provides the key link. The assertion of the universal condition – "All men [without markers] are born free and equal" – becomes the basis for challenging the indigenists/revivalists who claim a special status in the name of their difference and who seem to be wanting the freedom to revive a hated past. The transition from communism to communism takes place in this context. It may be worthwhile to study the specific contexts in which the early communists, much like the early social reformers and the leaders of the 'backward classes', found a more secure ally in the modern liberal/socialist doctrines coming from the west

What further complicated the situation in the context of the Indian communist movement was that it became totally unreflexive by virtue of its complete dependence on the Comintern and the Soviet Union, not merely for its ideological-theoretical nourishment but also its organisational co-ordination. The problem, it seems, is not where a particular idea is born but whether it has the capability to adapt to different conditions which, I have been arguing so far, was the case with marxism but which was precisely the casualty of its canonisation.

Muzaffar Ahmed narrates how the work of the CPI began at four different places – Calcutta, Madras, Bombay and Lahore – in the country around the same time. "It was not as if the initiators met and decided to start work ..In each place it started independently. They did not even know each other." He goes on to explain how in these circumstances, and given the large distances within India, each of these four groups maintained separate/independent contact with the Comintern [Ahmed 1981:62].

Symptomatic of the control of the Comintern over the Indian Communist Party was the first Manifesto of the Party – titled "Manifesto to The Delegates of the XXXVI Indian National Congress". The document was written and printed in Moscow by M N Roy and approved by Lenin and Stalin. It is interesting that the people who drafted and approved the document had no day to day touch with the movement in the country. Mikhail Borodin had gone to Madrid to attend a conference and brought with him a pile of Indian papers for Roy, who submerged himself in them to eventually produce the document. The Manifesto is full of unsought advice to the Congress. It further displays the most elementary lack of political sense in that it shows no appreciation of the dynamics of political dialogue: why should the delegate to the Congress session take this unasked for bit of advice seriously when they do not even know, let alone trust those who are handing it out? The tone of the advice is often derisive in the extreme. For instance, it says: "Several thousand of noisy, irresponsible students and a number of middle class intellectuals followed by an ignorant mob momentarily incited by fanaticism, cannot be the social basis of the political organ of a nation."[13]

On the positive side, the document does try to expose the 'freedom first' argument by emphasising that there can be no genuine freedom without the toiling people and their demands figuring centrally in the movement. But then the document proceeds:

> How can the Congress expect to arouse lasting popular enthusiasm in the name of the Khilafat and by demanding the revision of the treaty of Sivres? The high politics behind such slogans may be easy for the learned intellectuals...but it is beyond the comprehension of the masses of the Indian people who have been steeped in ignorance not only by the foreign ruler, but by our own religious and social institutions...Their consciousness must be aroused first of all. They must know what they are fighting for.

In the event, of course, it was clear what the masses understood and what they did not, who in their perception, was talking 'high politics' and who was not? The document is therefore, more important because it completely failed to understand the meaning of what it called 'high politics' and 'abstract idealism'. For instance, it says:

> The programme of the Congress has to be denuded of all sentimental trimmings; it has to be dragged down from the height of abstract idealism; it must talk of the things indispensable for mortal life of the common human being.. the object for which the Indian people will fight should not be looked for somewhere in the unknown regions of Mesopotamia or Arabia or Constantinople...

Recall Malaka's lament that "with their hearts they remain with the Sarekat Islam – with their heaven which we cannot give them". The inability to understand the meaning of the peoples' heaven, the construal of all spirituality/religiosity as ignorance is centrally linked to the epistemological leap into the world of post-enlightenment rationalism. I must emphasise that I am not talking of communists not being religious but simply of being unable to understand the world of those who are religious. In other words, I am talking of the closure, the diremption entailed in this leap. If they could not understand the religious mind, nor could they understand the force of nationalism. I will not go into the details of that aspect as that has been written about in fair amount of detail.[14] It is also idle to argue about whether involving the Khilafat sentiment was a correct or an incorrect move on Gandhi's part. Surely its correctness or otherwise cannot be judged on the basis of purported outcomes. In any case, what I am underlining is the crossing of a particular epistemological threshold on the part of the communists.

That the influence of the Comintern was not simply ideological, made matters worse. The minimum autonomy that the Indian communists displayed was also repeatedly undermined. Muzaffar Ahmed, a devoted follower of the Comintern line narrates an incident which is illustrative. In a conference held in 1926, one of the items on the agenda was the change in name of the Labour Swaraj Party. In his words: " It was decided in the deliberations of the conference that the name of the Labour Swaraj Party would be changed to 'The Bengal Peasants' and Workers' Party'. Some of us present in the Krishnanagar Conference did not however, raise the issue that as a class the workers' name should come first. There would have been no use raising the issue before the 'praja' and 'krishak' [tenant and peasant] representatives. We said that in the tradition of usage of words in English, Workers' should come first, as there are less letters in this word. .Our argument was not accepted by a majority of the delegates" [Ahmad 1981:340]. The frivolity of the argument reveals the pathetic state of mind in which this proposal may have been put forward. In the third conference of the PWP of Bengal, held in Bhatpara in March 1928, the Communists managed to get the English name of the party changed to Workers' and Peasants' Party but the Bengali name remained what it was [ibid:348].

There can be no other explanation for this desperate behaviour except fear – the fear of ridicule and disciplinary action by the Comintern. If Ahmed himself did not feel compelled to press for a change of name at the Krishnanagar conference because it would not have cut ice with the peasant delegates, what else was the desperation about? Marxist orthodoxy decreed that there could be only one party

to a class. Only the Communist Party could represent the working class and only one class could be represented by any party. What then was this business of two-class parties? The mystery is uncovered many many years later, in 1960, when Muzaffar Ahmed writes to Clemens Palme Dutt, through his brother, Rajni Palme Dutt to seek some clarification regarding the expulsion of M N Roy from the Comintern. "As regards Roy's expulsion..." replies C P Dutt, "(B)y the end of 1927, Roy had already come under heavy criticism for his policy in China...Then came his discrediting in connection with India. Apart from the decolonisation theory, he was attacked, firstly because he had given exaggerated reports about the strength of the Communist Party of India and his influence there and, secondly, because he was attempting to build a Workers and Peasants Party as a kind of alternative to the Communist Party...Roy answered the criticism that it was wrong to form a political party on a 2-class basis by saying that what was required in India was not merely a 2-class party but a multi-class party" [ibid: 402].

Characteristically, Ahmed, even while publishing this damning letter refused to draw the conclusion that he ought to have in his memoirs. After all, it is abundantly clear from his accounts that the formation of the PWPs and the WPPs were no conspiracies hatched by Roy; all of them, including Ahmed believed in the need for forming them and in my view, rightly so. The subsequent dissolution of the WPPs can now be seen in perspective. It may not be entirely out of place to mention that with the accession to power by Hitler and the turn in the Comintern's line in 1935, in its Seventh Congress, when the world-wide tactical shift was towards formation of United Fronts, Indian communists were to see sermonising in a very different direction. The well-known 'Dutt-Bradley Thesis' authored by R P Dutt and Ben Bradley of the CPGB, directed the formation of a mass anti-imperialist front – in fact of the transformation of the Congress itself into a multi-class party!

The glimpse of the Indian communist movement that we see here gives a diametrically opposite picture from the Chinese one, particularly the phase after the ascent of Mao. The history of the Chinese Communist Party before that phase is also of course replete with instances of sharp struggle against the disastrous attempts to impose the Comintern's line. The struggle against what was known as the group of 28 Bolsheviks or the 'Returned students' (i e, returned from Moscow) *has been officially recognised by the CCP. Mao himself has said on occasion that the CCP could make the Chinese revolution successful by going against the* wishes of Stalin.

What the above discussion highlights then is something more than mere centralisation of command within the Comintern. The suppression of local initiative goes hand in hand with the hard choice that the communists of the colonial world were presented with: a choice between two epistemological worlds. It was a choice within which is located the final leap of Indian communists. It would however, be an oversimplification to say that force alone was responsible for this transformation. There is an elaborate mythology through which the hegemony of the Comintern is established. This mythology has a peculiarly theological structure where the world is divided between believers and non-believers: "Those who are not with us are against us". The fear of excommunication is as strong within this world as it is in any other religion. In the event, the canonisation of faith has all the other attributes that go with religion: a set of sacred texts, a pantheon of gods, a Papal authority and the mythology that sustains the faith. Reason is finally sublated into its opposite and in a typically Hegelian 'auhfebung', if there ever was any, a synthesis of the rationalist religion occurs. It is the stranglehold of this mythology to which even Mao submits in the end, when he makes his existential choice of remaining within the fold of believers – his constant fear of becoming another Tito, recurrent in so many of his writings and speeches ensures this choice.

VI

In conclusion, I would like to draw attention to one of the first footnotes of Marx's doctrine – written by Marx himself and all but erased by his followers. I am referring to Marx's correspondence with Vera Zasulich – the Russian Narodnik-turned-Marxist. In 1881, Teodor Shanin tells us, Marx spent three weeks agonising over a reply to Zasulich's letter, during which he wrote four drafts puzzling over the issue of the Russian peasant commune. He tried to understand the decline of the peasant commune not as an absolute law of history but as a historical contingency [Shanin 1983:13-147]. Recovered after his death, it was sent by Engels to the Group for the Emancipation of Labour (of which luminaries like Plekhanov and Zasulich were members) for publication. After a long silence of seven months, they replied to Engels saying that they would publish it once they got it translated into Russian. They never did. Finally it was published in 1886, in *Vestnik Norodnoi Voli* (Vol 5). The only positive response to the letter, the Japanese scholar Haruki Wada informs us, was from among the Populists (Narodniks). They were discovered, according to Wada, in 1911 by D B Riazanov who with Bukharin's help managed to decipher them in 1913. One full decade later they were again discovered accidentally by a Menshevik called B I Nikolaevskii and published in 1924. In 1926, Riazanov published them separately [ibid:41-42]. Writing as the defender of what was already a canon, Riazanov said that the letter and its drafts represented a decline in Marx's scholastic capability [ibid:42]. Both Wada and Shanin have documented in detail, the turmoil that Marx was undergoing and the small but significant changes he was making in fresh editions of his earlier writings. In the French edition of *Capital* published in 1875, for instance, he deletes one paragraph on primitive accumulation that says that in different ways, the same process is going on in different countries everywhere. The new passage restricts the scope of his theoretical generalisations to western Europe [ibid:48-49].

It is this passage from the French edition that Marx quotes from in the letter to Zasulich and remarks: "Hence the 'historical inevitability' of this movement is expressly limited to the countries of western Europe" [McLellan 1977:576]. Following the outbreak of the Russo-Turkish War sometime in 1877, Marx wrote to F A Sorge:

> This crisis is a new turning point for the history of Europe. Russia...has for a long period been on the brink of revolution. All the factors for this are already present...The revolution this time starts from the east, that same east which we have so far regarded as the invincible support and reserve of counter-revolution" [Quoted by Wada in Shanin 1983:55-56].

In other words, the canonisation of Marx deprived later marxists of the most crucial insights that could be had from the way in which he was grappling with 'the problem of the east' – for which we had to wait for the Leninist and Maoist moments of reformulation of theory. The critical spirit of Marx that is repeatedly in evidence throughout his life and seen in this dramatic episode, was the first to be killed. In order to preserve the canon and the icon Marx, the critical philosopher had to be killed first. The reconstitution of the com-munist self began with the (re)construction of Marx.

Notes

[I am grateful to Rajeev Bhargav, Nivedita Menon, Ravi Sundaram, Subodh Varma, Charu and Mukul for their comments on an earlier draft of this paper and for ongoing useful discussions and criticisms. I also wish to thank Nandini Gooptu and Akbar Zaidi for their critical comments. The errors remain mine.]

1 As will be seen, my use of the term is very different from certain fashionable usages in the vast and burgeoning literature on 'postcoloniality' in literary and cultural studies, which valorise so-called hybridity and the domain of the third world diasporic intellectual - the 'migrant-as-exile'.

2 I take the expression from Abdel-Malek *Nation and Revolution: Volume 2 of Social Dialectics*, The Macmillan Press, London and Basingstoke, 1981, whose work I will keep referring to in this essay. This idea has also been used by Cuban communists in their notion of the 'Tricontinental'. The three continents are of course, Asia, Africa and Latin America.

3 I must state that in saying this I do not mean to reduce the entire history of marxism to this phenomenon, but that it is this aspect of this marxism, that concerns us here.

4 There is need to define the subject 'us' here. There are two senses in which I use the word. To the extent that my examination of marxist ideology is both, a specific way of interrogating the larger universalistic radical project as well as the ideological project of modernity whithin which we are all willy nilly implicated, this we/us represents both the modern subject in its abstractest sense and the radical dissenting currents within it. As I will argue, I believe that no radical vision in contemporary society can pretend to be untouched and unshaped by marxism. Hence also, the unabashed use of the terms 'we' and 'us'.

5 I am aware that the canonised versions built on certain resources that already existed within 19th century marxism. However, this was not the inevitable direction marxism ought to have taken – after all, at any point, there are multiple possibilities of future advance.

6 It is not my intention to go into the type of argument that Aijaz Ahmed (*In Theory – Classes, Nations, Literatures*, Oxford University Press, Delhi, 1994) makes against Edward Said, in defense of Marx. Ahmed's project is, I believe, fundamentally different from mine, for he seeks to reaffirm the purity of marxism and defend the Orthodoxy against all kinds of perceived 'attacks'. The purpose of his strident defense is the mere reiteration of faith among a fast dwindling sect, the shrillness of whose rhetoric is in direct proportion to the shrinking of its ground outside. In his polemic with Said and others, Ahmed repeatedly underlines that this assertion of the Oreintalist trappings of Marx's writings are 'based almost always on that same passage...' (p 14, for instance). The passage in question is from Marx's articles on India – "his journalistic observations" as Ahmed puts it, about colonialism being the unconscious tool of history. I have therefore, used very different passages and quoted from scholars who too, do not depend on a single isolated passage.

7 The disparaging tone in which a defender of orthodoxy like Ahmed talks of the 'metropolitan Left' can surely leave no doubt that marxism (the pure and pristine one) is passe there. The hopes of many western marxists too rest on the marxists of the Three Continents.

8 This, one would have thought, is historical materialism at its best.

9 Ibid, p 249. Claudin depends for most of the documentary evidences on the best source so far available on the issue, namely, Carr'e re d'Encausse and Stuart Schram (1965) *Marxism and Asia*, Allen Lane The Penguin Press. I have used both but most references here are to Claudin.

10 Ibid, pp 315-16. The reference to the dogmatists is to the section within the Chinese Communist Party which wanted to mechanically replicate the Comintern's line.

11 Rajeev Bhargav has drawn my attention to the fact that this too was not the 'real' Hegel, but the Hegel seen through the lens of 19th century marxism.

12 I am emboldened to make this provocative claim drawing on the very contemporary experiences also. The lived marxism espoused by the millions of cadres and followers of the communist parties in India even today, is no more than the political imaginary of communism, which they believe was wrecked due to wrong practices but which still retains its attraction, precisely as an imagined future. This has nothing to do with the High Theory of marxism propagated as 'weltanschauung' and as philosophy, in party journals.

13 The document is reproduced in Muzaffar Ahmed, op cit, all quotations from CPI documents, unless other wise mentioned, are from this text.

Urdu in India since Independence

Ralph Russell

What ails Urdu in India today? It is government apathy as much as lack of private, non-government action. While the elite proponents of Urdu wait for somebody else to do something about the promotion of Urdu, there are many things which individuals or small groups can do. Those who love Urdu need to shake off the feeling of persecution and use the factors that work in favour of Urdu.

THE link language of everyday communication in India continues to be, as it was before independence, one which is as much Hindi as it is Urdu. It is true that since independence the government has shown apathy and worse towards Urdu. But the proponents of Urdu focus almost exclusively on the injustices done to Urdu. They too often call upon somebody else – such as the government – to do something instead of doing it themselves. They have failed to take advantage of factors that favour Urdu. The defence of Urdu requires an increase in the number of people who have a command of it. The first step is education. But one need not depend on government-run Urdu medium schools. Those who have a command of Urdu can start teaching it in their own neighbourhoods. Confining Urdu to the Persian script also works against its spread. There is a large readership for Urdu works written in Devanagari script and also for Urdu works introduced through English.

In 1949-50 I spent the greater part of my study leave at Aligarh.* In those days, in the area regarded as the heartland of Urdu, UP and to a lesser extent Bihar, the state governments were doing everything possible to destroy it. This was achieved by an absurd interpretation of the 'three language formula' devised by the government of India. This recommended that in every state three languages should be taught in the schools - (1) the language of the state (which would normally be the mother tongue of the majority of its inhabitants) (2) another modern Indian language (Hindi would often be chosen where the first language was not Hindi), and (3) one other language. A good deal of elasticity was envisaged in the implementation of this formula, and in UP Urdu, the language of most inhabitants of UP after Hindi, could, and should, have been chosen. The UP government decided instead to declare Sanskrit a modern language, and the teaching of Urdu in the schools – it had been taught in all UP schools before independence – was discontinued. On the whole that situation has continued ever since, at any rate until fairly recent times, when I understand some minor changes have taken place in the situation. In the first years of independence the main reliance of those people in the Urdu field who wanted to preserve Urdu as far as it could be preserved, to allow for its development and to counter the policies being pursued against it was to rely upon the sympathies for Urdu that existed at the level of the government of India. Nehru, who spoke Urdu well, was in favour of doing something to support it and was opposed to the policies of the UP government; but the centre was not in any position to dictate the course which UP government should follow, and the best it could do was to provide funds and other support for organisations manned by the supporters of Urdu.

Let me consider the measures taken by central government over the last two decades or so. The government of India, at any rate from Indira Gandhi's time onward, had its own reasons for doing something to support Urdu. There were political considerations motivating this, which did not necessarily have much to do with sympathy for Urdu. A committee was set up in 1972, headed by I K Gujral, to consider how the cause of Urdu could be advanced. The report of the committee, which amounted to more than 250 pages, was presented in 1975 and 187 recommendations were made. This report was 'put on ice' and the main reason for this was the vigorous opposition of Jagjivan Ram to anything being done for the cause of Urdu and Indira Gandhi's desire not to alienate him in the political situation which obtained at that time. However, in due course the Gujral report was laid before parliament. Then, successively, two committees were set up to look once more at the situation of Urdu – one headed by Ale Ahmad Suroor "a sub-committee to examine the recommendations of the...Gujral Committee" (set up in 1979; reported in 1983) and one headed by Ali Sardar Jafari (set up in February 1990; reported, with unusual promptness, in September 1990). The Jafari committee discovered that 95 per cent of the recommendations made in the Gujral report had not been adopted. The state government of Bihar, and shortly afterwards that of UP, recognised – on paper – Urdu as an official language of their respective states.

Som Anand, in an article written in 1992 says that quite substantial financial support was given to Urdu, but that the situation in the Urdu-speaking community was such that it had not been able to make proper use of the support which was given. He says the government of India makes considerable efforts to help the Urdu press, but the Urdu newspapers are in no position to derive any benefit from this. The United News of India (UNI), at the instance of the government of India, decided to start an Urdu teleprinter service for the newspapers with a grant of several lakh rupees from the government. The UNI offered this service to 40 Urdu newspapers, but this offer has not yet been taken up. But this is not the only difficulty. To get such a service operating, you need good translators, and these are not available. The fact is that the new generation of Urdu speakers has grown up at a time when Urdu is not taught, so how could you expect to find young people who know Urdu well? And on top of that, in the so-called Hindi area of northern India, the standard of education in English has also declined very considerably. The result is that Urdu translators who are employed by the Urdu newspapers know neither good English nor good Urdu.

What could individual Urdu speakers or small voluntary organisations formed by them have acted to combat the dangers that Urdu was facing? One thing that they could have done was ensured that their own children learnt to read and write Urdu. If the schools were not providing for their education, the parents themselves could have provided it, and by and large they did not. Even in Urdu-speaking families people who were generally devoted to Urdu and whose children were also interested in Urdu, had not taught their children to read and write it. Urdu for them was simply the language of the home. Many of them enjoyed Urdu poetry; they would go to mushairas and most of them could

* I am a lecturer in Urdu at the School of Oriental and African Studies in the University of London. I have been in India on one-year study leave three times, the last of which was in 1965. During these I had an opportunity to observe at close quarters what was going on in the world of Urdu. My other sources are newspaper articles and correspondence with people connected with the promotion of Urdu.

understand what was being said. I remember seeing a young relative of the late Habibur Rahman writing down in Devanagari script Urdu verses which appealed to her. On another occasion I met Ismat Chughtai. She told me that her daughter could not read and write Urdu. So one asks the question, why not? Why didn't the parents make sure that their children could read and write Urdu? It seems to me that whatever the difficulties, it was, and is, primarily the responsibility of people who love Urdu and Urdu literature to arrange for the teaching of Urdu and Urdu literature themselves. They could and they should do that; and if I am not mistaken, they are not doing it.

It should be obvious that the basic thing that needs to be achieved for the defence of Urdu is a considerable increase in the numbers of people who have a command of it, not simply Urdu colloquial speech, but the Urdu which enables one to read and appreciate Urdu literature. Anyone who is concerned with increasing the numbers of people who are competent in Urdu can do something practical about it without any external support at all. In many immigrant communities in countries like Britain people want their children to acquire a much better knowledge of what some people call their heritage language than is provided for in any official provision in the schools and the educational system. They act accordingly. That is, they themselves set up classes, hire rooms or meet in suitably sized rooms in their own houses and impart some instruction to their children. And there is absolutely no reason why Urdu speakers in India shouldn't do the same.

Obviously, there are some spheres in which nothing very substantial can be done by individuals or small-scale voluntary organisations. There are bodies established in the states and at the all-India level to promote the cause of Urdu.

It seems to me that in order to make a fair assessment of what these bodies have done – or failed to do – we need to know a great deal more about them. The questions I would like to ask are: what is the extent of government funding; what is the constitution/terms of reference; who are the members of its governing body, and how are they chosen; does it issue regular reports of its activities, if so, how often, if not, are there informal accounts of its work available.

I learnt through correspondence in 1996 with the chancellor of Jamia Millia that "[Anjuman i Taraqqi i Urdu] is not entirely dependent on government funding. It gets a government grant of Rs 1.30 lakh annually from the Delhi Administration Its income from rent of its own multistoried 'Urdu-Ghar' is more than sufficient for its needs. It has a general body of 40 members and elections are held every five years. I doubt if they have any regular system of reporting to government." He also wrote that the "[Taraqqi Urdu Bureau] is entirely dependent on government funding. Reporting to government does not appear to be regular. The Bureau is passing through a 'retiring' phase."

As I wrote in an article in the *Indian Review of Books* (September 15-November 15, 1995), one of the most disappointing features of the picture is the idleness and ineffectiveness displayed by those who have seen themselves as the trustees and leaders of the Urdu-speaking community. Substantial resources were from very early days made available by the central government to organisations established to support and promote the interests of Urdu. But the record of these organisations is a far from impressive one. In 1949-50 I spoke personally to some of those who sat on the governing body of the Anjuman i Taraqqi i Urdu and urged them to draw up a coherent plan of activity and proceed to implement it.

One thing I drew attention to was the fact that we did not have good, accurate texts of even the greatest Urdu classics. I gave them the example of the Oxford Classical Texts of the great Latin and Greek authors, saying that the sole aim of those who prepared these texts was to publish as accurate a text of each author as it was possible to establish. If the Anjuman i Taraqqi i Urdu did nothing but that, it would be an enormously valuable service to the cause of Urdu. Twenty years later its total achievement in this field was the publication of one such text, Imtiyaz Ali Arshi's edition of Ghalib's Urdu verse. There were other ambitious projects allegedly started but never proceeded with, or, if proceeded with, never completed: and work done in connection with these projects which could and should have been published without impairing the success of the projects as a whole, never appeared.

I well remember a conversation I had with Ale Ahmad Suroor in 1965. I urged that a plan to publish all of Ghalib's writings in good, reliable texts should be initiated at once so that these could appear in the centenary year, 1969. All that did appear was a disgracefully produced reissue of a volume of Ghalib's letters first published in the 1930s. In the same conversation he told me that he had received a glossary of the vocabulary of Nazir Akbarabadi, which he had asked Maikash Akbarabadi to prepare. I said, "Publish it now. It can still be used as material for the full-scale Urdu-Urdu dictionary you are planning". He rejected the idea. And 30 years later we have neither a full-scale dictionary nor the glossary. I was told in later years that Maikash's glossary had been lost.

Rashid Hasan Khan, in an interview with Ather Farouqui says:

> The Taraqqi Urdu Board [Bureau] long ago planned to produce a comprehensive Urdu dictionary in four or five volumes. Some extremely famous people...[who?] were chosen for this task and one volume was allotted to each. For years together regular payment was made to these people, and each was given an assistant. Years later it was learnt that work on the dictionary had not been completed. When the time came for them to render account of what they had done, these revered gentlemen returned their materials in the same state as they had received them...no work is now being done. There is an urgent need for an Urdu dictionary, but after 10 years of continuous effort the Taraqqi Urdu Board has to this day not been able to compile one...Granted, a concise dictionary has been printed. I read it...and found not a single page in which there were not one or two mistakes of one kind or another. The University Grants Commission made a plan for a history of Urdu literature in four substantial volumes. An appropriate grant for this purpose was given to Aligarh Muslim University. At first the University prepared an excellent plan, and the details they presented convinced me that this history of Urdu literature would be a work of really high quality. Nine writers, all of them very well-known and highly regarded, were involved in the project. The first volume was to cover the period from the 12th to the 17th century AD. When the first volume appeared I read it – and you cannot imagine my astonishment...All its references were completely unreliable, nor could one rely on the accuracy of the passages quoted. I wrote a detailed review of it at the time...This was reproduced in a number of periodicals and was much talked about. As a result all copies of this first volume were taken off the market and piled up in Aligarh, and a statement was issued that it would be corrected and then re-issued. To this day no corrected edition of the first volume has appeared, and neither have the remaining volumes (*Akhbar i Nau*, December 2-8, 1988).

Atiq Ahmad Siddiqi tells us in his article 'Status of Urdu in India' "the [Taraqqi] Bureau for the Promotion of Urdu set up by the central government has brought out about 700 useless books; most of them are translations. Similarly, Sahitya Academy and National Book Trust, both government organisations, have brought out a large number of useless Urdu books (*The Nation*, Lahore, October 4, 1993). Later in the article he is similarly critical of the

Urdu academies that were established in many states and which have been "rendering so-called useful services".

Shamsur Rahman Faruqi in his interview with Ather Farouqui says that teachers at the university level started a retrograde strategy to save their jobs. Urdu teachers convinced university authorities that since enrolment in Urdu was dwindling seriously, it was necessary that even those students who did not read Urdu at any level whatsoever, or inferior students, should be granted admission if they wished to study Urdu as a subject in BA or MA This resulted in the intake of incompetent candidates as Urdu students. These incompetent people, having obtained their degrees, joined the Urdu departments as teachers. "Then followed the illiterate line of students taught by these illiterate teachers. It seems that now this phenomenon of generations of illiterates after illiterates will never come to an end" (*The Nation*, Lahore, July 8, 1994).

Not only did the champions of Urdu fail to do what they should have done on their own initiative, they failed to do what they had promised – and what they had been paid – to do. To crown it all they themselves took active steps which in Shamsur Rahman Faruqi's words "proved very harmful for Urdu". I think it regrettable that Rashid Hasan Khan does not name all the distinguished people whom he characterises in harsh (and fully justified) words. These people do not deserve the protection of anonymity – they need to be thoroughly exposed.

I am well aware that dissatisfaction with the role played by bodies like the Anjuman i Taraqqi Urdu and the Taraqqi Urdu Bureau commonly leads people to wash their hands of them In that this leads to the formation of organisations that make it a policy to refuse to accept government funding and free themselves of all obligation to governments and their policies. This dissatisfaction is welcome. Such completely independent organisations are indeed necessary The Maulana Azad Research and Educational Foundation was one such. I learnt from a letter that "the Maulana Azad Foundation was registered in 1989...From the very first day it has been our policy not to accept any kind of help from the government of India, so that government policies cannot influence us either directly or indirectly To continue the work of an organisation run on these principles is extremely difficult, but we are putting up with all such difficulties... The Muslims of Sikandarabad are the sole source of our funding" Another letter said, "From the very outset it was resolved that the members of the Foundation would not accept employment by the government of India, would not accept membership of any governmental or non-governmental committee and would not establish any relationship, direct or indirect, with the government of India. Members would not accept any financial assistance from the government of India, or any grant, or any prize. They would also as far as possible try to abstain from taking part in any seminar or mushaira connected in any way with the government of India. As far as possible they would refrain from publishing anything they write in Urdu periodicals partly funded by the government."

The foundation has also been running two Urdu medium junior high schools in Sikandarabad. The only other Urdu schools in UP are run by the Aligarh Muslim University. In these two schools both Urdu and English are available as the medium of instruction, and most parents choose the English medium for their children, although the level of proficiency in English of these children is such that this is an intolerable burden for them, even though the level of English used is extremely low. In short, Urdu medium is at its last gasp in both these schools and within a few years this so-called Urdu medium will cease to be used.

Ather Farouqui writes in an article in the *Economic and Political Weekly*: "At a few places Urdu medium primary schools are run by local bodies where teachers were appointed...Most of the people appointed...the so-called Urdu teachers, generally do not even understand what is meant by the term Urdu medium... Therefore, in UP, Urdu education means teaching Urdu as a subject. It is unfortunate that few of the so-called Urdu teachers in UP can even read the books in Urdu script meant for primary classes. It has also been observed that the Urdu teachers in UP are engaged in their family occupations like agriculture and milk dairies and go to the school once or twice a month."

Dissatisfaction with government-sponsored organisations is justified, and the setting up of independent bodies to defend Urdu and assert and campaign for its rights is a welcome development. But it should by no means follow that no further interest should be taken in government-sponsored initiatives. If associations and bureaus and academies set up to advance the cause of Urdu are not doing so satisfactory, this needs to be said in organised public criticism of them, and, even more important, plans of activities which they should be carrying out need to be worked out, and widespread campaigning initiated and sustained to press these bodies to adopt these plans. It follows that bodies like the Maulana Azad Foundation should similarly have a coherent programme of activities which they should publicise, and for which they should enlist practical support on as large a scale as possible. The same applies to approaches to the government of India.

The protagonists of Urdu seem to me all too often to call upon somebody else to do something instead of doing it themselves, and that there is a historical background to this attitude, formed in the centuries when Muslims constituted the ruling elite of India. Shamsur Rahman Faruqi, who is himself a member of the UP Urdu-speaking elite strikes a rare – and welcome – note when he says in his interview (in English) with Ather Farouqui published in the Lahore paper *The Nation* on July 8, 1994: "The Muslims of Uttar Pradesh...have a sense of superiority, which I consider quite stupid really...The UP *sharifzada* will never do for himself anything that he can command, persuade or cajole anyone else to do for him."

There is a proposal that the teaching of Urdu should be taken on as one of the main tasks of the religious foundations, the madrassas and so on, which are primarily established for the imparting of Islamic learning. I do not think that there is any point in this at all. In the first place, why should the job be handed over to other people. The champions of Urdu are looking for someone else to do work which they ought to be doing themselves and which they are not doing. In the second place, there never has been the least evidence that these organisations are interested in the teaching of Urdu, or at any rate in teaching it to any very worthwhile level. These madrassas have functioned continuously both before independence and throughout the whole period since independence and not one of them has ever shown the least interest in teaching Urdu to the level which would introduce their students to Urdu literature. They are concerned with religious questions and only with religious questions It is not in the least likely that they will undertake this task on anything like a large scale. As far as my experience goes there is no reason to assume that the attitude of the teachers in religious institutions has changed much since the time of Ashraf Ali Thanavi when, almost a hundred years ago now, he wrote *Bahishti Zevar*. He has a chapter in Part Ten in which he lists all the kinds of books which women should not read. But two things have to be said about that. Firstly that we want women to be able to read everything that men can read. Secondly, the disapproval of the kind of literature which Ashraf Ali Thanavi, censures obviously extends to the literature which men read. In *Bahishti Zevar*, he lists among other books that should not

be read: "divan aur ghazalon ki kitaben" "divans and books of ghazals" – in other words, virtually the whole of Urdu poetry and certainly that part of Urdu poetry which is the most valuable; the *Indar Sabha*; the story of Badr i Munir, that is the story of the masnavi of Mir Hasan; *Dastan i Amir Hamza, Gul i Bakavali* and other books. To expect people who are dedicated to religious teaching to teach people to read some of these best works of Urdu literature seems to me quite unrealistic.

I come now to what I think the protagonists of Urdu should do. I do not object to them saying that other people, like the government of India, state governments and so on, ought to be doing this, that or the other, and should be pressed to do so. I do not object to them saying that we should try and get teachers in religious institutions to take up Urdu. I do not object to these things, but they should pay far more attention to what they themselves should do, regardless of what other people are or are not doing. There are some important activities in which all protagonists of Urdu need to engage themselves and all others whose support they can obtain. One such is the production of Urdu materials in the Devanagari script. It would be extremely helpful to people who know Urdu but who cannot read the Urdu script and to the cause of Urdu generally if Urdu teaching materials and works of Urdu literature were published in the Devanagari script.

All organisations – government-sponsored and voluntary – ought to consider the implications for them of the fact that many Urdu speakers know Urdu but do not know the Urdu script. They are anxious to read Urdu, but they can only read it if Urdu literature is presented in the Devanagari script. In my opinion it should be entirely within the remit of the government-funded organisations to produce texts of important and popular Urdu authors in Devanagari script. They should not wait for other people to do this. If they are concerned with the advancement and promotion of Urdu they should provide for the needs of those Urdu lovers who know Urdu and want to know more about it and to be able to read more of its literature, but do not know the Urdu script.

Publications of Urdu works in the Devanagari script, of course, serve a wider audience than that which I have just described. They serve the audience of Hindi speakers who do not know Urdu but are interested in what Urdu literature has to offer. I think that Hindi speakers offer the next most favourable audience for Urdu literature after that of Urdu speakers themselves. True that there are people – *some* people – in the Hindi speaking community who are the most vociferous opponents of Urdu, but it would be a great mistake to think that all Hindi speakers share their attitude. There are among Hindi speakers substantial numbers of people who do not want to make Urdu their first language, but are nevertheless interested in getting access to what Urdu literature has to offer. This is proved by the number of publications of Urdu works issued by Hindi publishers in the Devanagari script. Quite numerous selections from popular Urdu poets are being published by Hindi publishers. I know that in her later years, according to what she herself told me, Ismat Chughtai could always find a publisher for her stories in Devanagari before any Urdu script version was published. And Muhammad Umar Memon of the University of Wisconsin, US, tells me that almost all of Manto's works are now available in Devanagari. My experience is that champions of Urdu are for the most part simply unaware that this is going on and even if they are aware they take an attitude towards it more or less of indifference – and they certainly should not.

Already in the early 1950s there was a multi-volume publication called *Sher-o-Sukhan*. This was a comprehensive selection of Urdu poetry presented in the Devanagari script with, at the bottom of the page, explanations in Hindi of the meanings of Urdu words which the editors thought their readers would not otherwise understand. A periodical published in Allahabad, *Urdu Sahitya*, presented contemporary writing in Urdu in the Devanagari script and with explanations of difficult words. An anthology of Urdu verse in English was published in 1995. This is a bilingual book with Urdu text on the left-hand page and the English translation on the right-hand page. At the suggestion of the publishers Urdu text is presented in the Devanagari script. Again this is clear evidence that there are more people who want to read Urdu poetry in Devanagari script than in the Urdu script. *Masterpieces of Urdu Ghazal from the Seventeenth to the Twentieth Century* published in 1990 gives the Urdu text in the Urdu script on the left-hand page and on the right-hand page an English translation and then a transliteration or transcription of the Urdu text written in roman letters. There are two other collections – *Masterpieces of Urdu Rubaiyat* and *Masterpieces of Urdu Nazm*.

Rahi Masum Rasa in a stimulating interview in *Akhbar i Nau* (February 9-15, 1990) said that unless the classics of Urdu literature were published in the Devanagari script they would cease to exist for future generations. He also said that Urdu speakers should discard their traditional script and adopt Devanagari instead. My own view is that there should be no compulsion to adopt the Devanagari script, but equally there should be no opposition to those who choose to do so. Every support should be given for publication of Urdu works in Devanagari as well as in Urdu script editions.

Adoption of Devanagari was also one of the recommendations of the Gujral Committee report: "There is a strong case for publishing Urdu books in Devanagari script...The *diwans* of Urdu poets and the anthologies of Urdu poetry in Devanagari script have sold in thousands. In our opinion, the experiment should be extended to cover fiction and humour also." The Suroor sub-Committee repeated this recommendation adding that "the government should earmark some funds" for this purpose (Recommendation no 84). And the Jafari Committee reiterated all this. These recommendations were very welcome ones. What one would like to know is whether the government, or the organisations established to promote Urdu, have taken any notice of them. Ali Sardar Jafari, the chairman of the third of the three committees, had already taken an admirable initiative many years ago in producing Devanagari editions of Ghalib and Mir.

One important, and much to be desired, consequence of making as much Urdu literature as possible available in Devanagari is that it would do something to hinder the efforts of Hindi chauvinists to expel from contemporary Hindi what they falsely call 'un-Indian' elements. Urdu in Devanagari script will help to maintain in Hindi the use of much vocabulary which is still, despite all the efforts of the Hindi chauvinists, common to the two languages.

There is another constituency of Urdu literature, that of those who can only approach Urdu literature through the medium of English. My own two books written in collaboration with Khurshidul Islam, *Three Mughal Poets* (1968) and *Ghalib, Life and Letters* (1969) were meant for people in the English speaking world. When they were a year or two ago, they sold quite well, obviously here in India. The publishing firm Rupa is anxious to publish English translations of works of Urdu literature.

It is not only publishers' realisation of the existence of this wider audience for Urdu literature in English that has made them ready to publish books like these. Since the rise of the women's movement and since the emergence of a strong anti-racist movement in the west, respectable publishers are frightened of being seen as in any way conforming to the values of racism or anti-feminism and one of the interesting results of this has been that

Asian woman who has translated from Urdu, stands a very good chance of having your translations accepted for publication in the UK and the US especially if it is women's writing that she has translated. This is a digression, but I wanted to make the point because even if there are quite fortuitous reasons which have not got anything to do with the value of Urdu literature, but which nevertheless make it possible for Urdu literature to be presented to a wider audience, we should not hesitate to take advantage of such factors

There is another, I think increasingly important, audience for Urdu literature presented in English in the second and third generation immigrants from Urdu speaking areas into the English speaking and the English knowing world and there are substantial numbers of such people both in North America and in Britain, and to a lesser extent in other European countries. In short, there is a much wider audience for books presenting Urdu literature in English than there was, say, 30 or 40 years ago. There was published in England, *The Penguin Book of Modern Urdu Poetry*, selected and translated by Mahmood Jamal (1986), and in India a Penguin book on Ghalib (Pavan K Varma, *Ghalib: The Man, The Times*, 1989) and numbers of translations of Faiz, including *The Rebel's Silhouette: Selected Poems*, translated by Agha Shahid Ali.

Those organisations which are concerned with the promotion of Urdu need to be concerned with all these audiences and not simply with the audience of those who are already able to read the Urdu script. For example, the Anjuman i Taraqqi i Urdu or the Taraqqi Urdu Bureau, needs to give support, including if necessary financial support, to any of those bodies, voluntary bodies, publishers, others, in this country and in other countries who are doing things which help the advancement of Urdu.

In my readings I have noticed that the extracts from the English and Urdu press are full of all the injustices done to Urdu, and there is very little else The account they give is perfectly accurate, and the greater part of this paper too has been devoted to them. But that is not the full picture. There are factors which are working in favour of Urdu and these too need to be described if an accurate, full picture is to be presented.

Waheed ud-Din Khan says in an article:

> My complaint is not against the national press, but against the Muslim press. At present all Muslim newspapers are trading in protests, complaints and the community suffering. It is a fact that the present Muslim journalism is protest journalism, not constructive journalism in any way This is the main problem. I may be allowed to say that the Muslim intellectual class itself is devoid of any positive thinking. Then, how can they work to promote positive thinking among ordinary Muslims? What are the Muslim newspapers doing? They are indulging in convincing the Muslims that they are an oppressed and deprived minority for whom all avenues of living and progress are closed. The reality is that problems and opportunities are always there in the world. The correct approach, therefore, is to find out the opportunities lurking among the problems and urge the people to utilise them while overlooking the problems. The correct formula is to 'starve the problems, feed the opportunities' (*The Nation*, Lahore, July 9, 1993).

Then there are distortions – dishonesty, to be quite blunt -- in the picture presented of the historical context within which the problems facing Urdu have to be seen. Perhaps because Ather Farouqui's thesis is the longest sustained treatment of these problems that I have read, I find him more guilty of these than most. His attacks on Hindu and Hindi chauvinists are fully warranted, but he greatly exaggerates the weight they carry on the Indian political and cultural scene. On the other hand he (and most other writers) are silent about the equally pernicious (and much more long-standing) Muslim chauvinism which is widely prevalent in the Urdu speaking community. Writers correctly assail the Uttar Pradesh government for declaring Hindi as the sole official language of the state. By exactly the same logic they should assail the government of Jammu and Kashmir for making Urdu its sole official language, when, as Syed Shahabuddin points out in his article in *Mainstream Annual 1988*: "Urdu is the official language of the state and the medium of instruction and yet declared as mother-tongue in 1971 or in 1981 as a household language by a very small proportion of the population who regard Kashmiri or Dogri or Hindi as their language". But I have never heard of any Muslim who takes the proper stand on this question.

Ather Farouqui argues, sometimes openly, and sometimes by implication, that Urdu speakers who have supported Congress or have consented to serve in government-financed organisations have 'sold out' to the enemies of Urdu. No doubt some of them have, but again this is much too simplified a picture. In particular his attacks on those Muslims who, long before independence was won, were with the Congress, are quite unwarranted. To describe Hayatullah Ansari as one "who raised the slogan of Urdu but who in fact had no interest in the welfare of Urdu and Muslims" (*The Nation*, Lahore, July 15, 1994), is completely unjust. He writes, "I consider the 20-lakh-signatures movement started by Dr Zakir Husain as an extremely unrealistic, escapist movement. Naturally, it did not yield any result". In what way "extremely unrealistic, escapist"? And why "naturally"? It is quite fair to say that the signatures campaign did not achieve the result it aimed at, but this does not mean that it was of no significance.

Waheed-ud-Din Khan's advice is to 'starve the problems, feed the opportunities', or, in other words, build upon the factors which help the cause of Urdu. Three of these have great significance. First, despite the efforts of the Hindi chauvinists the lingua franca, the 'link language' of everyday communication, continues to be, as it was before independence, one which is just as much Hindi as it is Urdu. This is evidenced by *Teach Yourself Hindi* (1989). On a typical page of the vocabulary provided at the end of the book, out of 73 entries 54 are words of this kind and there are only 18 words at the most which would perhaps not be understood by Urdu speakers. Secondly, the immensely popular Hindi films could equally accurately be called Urdu films. The Gujral Committee in para 140 of its summary of its conclusions rightly says that "the major contribution of films is that they have not allowed any barriers to grow between Urdu and Hindi". These two factors alone indicate that spoken Urdu is a language widely understood by millions of Indians, many of whom are not Muslims. Thirdly, interest in Urdu and its literature (especially its poetry) is widespread among very large numbers of people who do not know the Urdu script and have only a partial understanding of the literary language. I therefore quarrel with Ather Farouqui's view that Urdu is now essentially the language of the Muslims. And this is nothing new; Urdu always was essentially the language of the Muslims, notwithstanding that before independence it was also the language of much greater numbers of non-Muslims than it is now. I do not fundamentally disagree with Ather Farouqui on this point, but in the light of the positive factors I have spoken of, what is the point of constantly stressing that the Urdu speaking community and the Muslim community are virtually one and the same? Such a stress obscures the important point that the defence of the rights of Muslims and the defence and promotion of Urdu is not the concern of Muslims alone. These things are the concern of all those who uphold the declared ideals of independent India, and Urdu speakers need to reach out to all of them and work in harmony with them for these common ideals.

Courts, Civil Society and Public Sphere

Environmental Litigation in Calcutta

Hans Dembowski

With the help of public interest litigation cases regarding environmental problems of Calcutta, the article locates the city's problems of governance not so much in civil society as in the public sphere. Though the city does possess a criss-crossing structure of social web independent of the state, its citizens lack democratic trust in government agencies which remain inaccessible and unaccountable to their grievances. In such circumstances, the judiciary happens to be the only arm of government, providing rudimentary relief to citizens. Given the intransparency of the doings of other government agencies, the judiciary remains the only recourse to compel these agencies to function responsibly and thus stage a semblance of public sphere.

THIS is an essay in the sociology of governance. It deals with the division of power between the administrative and the judicial branches of government and their interaction with society at large. My findings are based on empirical cases of public interest litigation concerning environmental issues in the Calcutta area.

These cases, of course, must be seen in the context of 'judicial activism'. This phenomenon has, in the words of Upendra Baxi (1994:143) "transformed the Supreme Court OF INDIA into a Supreme Court FOR INDIANS". Scholarship generally regards judicial activism as a reaction to government lawlessness [Baxi 1994, 1996; Beteille 1997]. This fits in with a general notion of 'state erosion' in India [Rudolph and Rudolph 1988; Kothari 1989, 1995; Kohli 1990; Sudarshan 1990].

Indeed, the policy arena of urban and environmental affairs in Calcutta is ridden by a striking lack of trust. Citizens do not trust bureaucrats, petitioners have little faith in the judiciary, various NGOs eye one another with suspicion. Charges of corruption and incompetence are rampant. If a sense of trust does evolve, it is in individual persons. Unlike in Germany, my home country, there seems to be no trust in institutions or organisations *per se*. Of course, this has historical roots in colonialism. However, this diagnosis is not of much help when dealing with current problems of governance.

The theorem of 'Indian Communitarianism' [Joseph 1997] attempts to tackle this phenomenon as a consequence of the multi-religious, multilingual, multi-caste and multicultural fabric of south Asian society. Authors as Sudipta Kaviraj (1991), Partha Chatterjee (1995, 1997) or T N Madan argue that a notion of civil society and national citizenship can hardly arise in such a diverse setting. In a nutshell, their argument is that senses of loyalty are with one's immediate community which, in turn, is perceived to be competing with other communities in an all out struggle for dominance and even survival. This makes it unlikely to reach compromise as the result of reasoned deliberation.

My findings do not support this theorem. In the context of environmental litigation in Calcutta, problems of governance do not so much arise in 'civil society' as in the 'public sphere'. As these terms are often used interchangeably [Chandhoke 1995], the distinction needs some elaboration.

The core meaning of 'civil society' according Ralf Dahrendorf (1996:237) is the "criss-crossing network" of various non-state institutions: Families, religious groups, trade unions, clubs, market boards, etc. Civil society depends on civil liberties such as the freedoms of speech, of assembly, of association, of the press. The emphasis is on this social web's independence of the state. In Calcutta, such a criss-crossing structure does exist.

According to Craig Calhoun (1993:273), "public sphere" stands for an "arena of deliberate exchange in which rational-critical arguments rather than mere inherited ideals or personal statuses could determine agreements and actions". By definition, this has to involve the state. Government data must be available and reliable for the public sphere to operate, there must be ways to make the authorities accountable. Without a minimum of governmental transparency and responsiveness, there can be no effective public sphere, and civil society must remain politically impotent. The inclusion of government agencies in the bargaining and negotiating networks of civil society is so typical of western countries, that the distinction of public sphere and civil society has become blurred.

In Calcutta, however, these preconditions for democratic trust in a public sphere hardly exist. While there is freedom of press and open public debate, government agencies remain inaccessible and unaccountable. Legislations are not enacted, vital data remain classified, policy statements are not followed up by actions. In this context, civil society remains fragmented. I will argue that – to a limited, but not irrelevant extent – high court and Supreme Court have been giving citizens some leverage over the administration and are thus providing a rudimentary sense of public sphere. Public interest litigation inspires hope for relief but, so far, does not warrant trust in democratic governance.

The judiciary is itself bedevilled by the same phenomena of 'state erosion' as the administrative branch of government. Proceedings are slow and appear to be erratic. There is a generalised suspicion of corruption and collusion, exacerbated by intransparency. On November 24, 1997, the local pages of the *Asian Age* carried a report according to which the Supreme Court was investigating charges of corruption in the Calcutta High Court. Particularly its administration was said to regularly demand bribes in order to list cases.

The Calcutta metropolitan area faces tremendous environmental challenges. Air and water pollution, sanitation, drainage, noise, traffic congestion and waste disposal are all issues of serious concern. This has been amply documented on behalf of the state government [CMDA 1990, 1992, 1996; State Planning Board 1990; Ghosh 1991; CEMSAP 1995]. The undisputed cause of these problems has been unplanned growth over three centuries. In 1990, the assessment of the Calcutta Metropolitan Development Authority (CMDA) (page 9.1) read: "The chaotic sprawl that had plagued the metropolis during the last four decades will have to be checked with determination."

The CMDA must itself shoulder some of the responsibility. It had already been

established for two decades when this statement went into print. Nonetheless, the CMDA had not been successful in devising and implementing rational urban planning. According to Chinmoy Mozumdar (1998), politicians and bureaucrats had turned the CMDA into an "ideal environment for open corruption". The result was that "the Master Plan for the CMD area is still not charted even though the CMDA was statutorily established 27 years ago to do the same".

Systematic outline development plans are also required by the West Bengal Town and Country Planning Act of 1979. Urban planning is too fundamental an issue and the CMDA is too powerful and well equipped an institution to excuse this serious shortcoming with straits of staff and finance. Rather, this is an obvious example of governmental mismanagement.

This assessment sets the stage for the first two sections of my essay. They will present summarised assessments of two major complexes of environmental litigation in the Calcutta area. These are not comprehensive accounts of all relevant aspects. Rather, I will only attempt to highlight the most striking features. The third, concluding section will return to the more general issues of civil society, public sphere and urban governance in Calcutta.

I
The Howrah Matter

Howrah is the oldest industrial town in Asia. It tops the official list of "critically polluted areas" in India (*Asian Age*, March 17, 1998). Unlike Calcutta, the colonial era's "city of palaces", Howrah has always been a town of bleak workshops and dismal huts. After a century and a half of industrialisation, life in Howrah is still no better than what Friedrich Engels described in his 1844 classic, *Condition of the Working Class in England*.

The West Bengal State Planning Board (1990) reckoned there were over 570 large units of metal- and steel-based industries in Howrah. Other important industries included plastics, paints and jute. The estimated number of basically unregulated, small-scale industrial units was 32,000 (compared to only 42,000 in the much larger Calcutta Corporation area and a total of 1,50,000 in the metropolitan district).

Many of these industries are polluting. This is exacerbated by the fact, that there is no systematic zoning of residential, commercial and industrial quarters in this city of at least one million people Howrah's history is one of unplanned growth. According to local bureaucrats, Howrah has less than 5 per cent roadspace (compared to 6 per cent in Calcutta and an international standard of around 20 per cent). Roads are congested and full of pot holes. Garbage piles up along the roadsides. There is hardly any underground sewerage. Wastewaters are channelled through open drains that frequently clog and overflow. Howrah has very few public parks and hardly any open space. Recently, there has been a building spree. Many new residential high-rises in central Howrah add to the general sense of congestion.

As early as 1966, the Howrah Improvement Trust (page xi) declared the city to be "a town planner's headache". The reasons were "acute congestion, lack of adequate drainage system, housing shortage, absence of proper road alignments and other deficiencies in the matter of water supply, sewerage and community facilities". Twenty-six years later, the CMDA stated categorically that the city had "been deprived of the basic facilities and infrastructure from very early days". All measures taken so far had been "utterly inadequate". Accordingly, the CMDA called for stringent and enforced urban planning:

> If the growth is allowed to occur without any planned intervention it is likely that the spatial structure will be distorted with major deduction of open space, green areas and wetland. This would have very serious effect on environment. This should be prevented by all means. Unplanned urban growth in future would also aggravate the present damages that are being created by unscrupulous promoters in permitting high rise development with consequential densification of already congested parts of the city. This trend should be stopped to save the city [CMDA 1992:9].

The CMDA demanded massive infrastructure investment. Measures should include

- conservation of greeneries, parks, open spaces and water fronts;
- tree plantations;
- nature and wetland conservation;
- ecologically balanced waste water disposal;
- safe and hygienic disposal of all solid wastes; and
- environmental impact assessments for all major projects.

Such policy statements were not followed up by action. Rather, even in 1997, the 'Land Use and Development Control Plan for the Howrah Municipal Corporation' only existed as an unpublished draft.

This urban malaise is the setting of the 'Howrah Matter', a legal case which resulted from a writ petition by an NGO called, Howrah Ganatantrik Nagarik Samiti (GNS). The association had been started after Indira Gandhi's emergency rule by founder secretary Subhas Datta, a chartered accountant. Members include lower middle class Bengalis as well as Hindi speaking migrant labourers.

The GNS is rooted in the non-marxist, socialist tradition of the Jayaprakash Narayan movement. From its very beginning, it campaigned for better civic amenities but also against police atrocities, bad conditions in the local jail or poor postal services. It also took up foreign issues with rallies in support of Tasleema Nasreen or the Chinese students' democracy movement. Basically the GNS is a civil rights organisation that got involved in environmental issues because of immediate, every day exposure to grievances.

For almost two decades, the GNS relied mostly on rallies, memoranda and seminars. There were also incidents of civil disobedience in the tradition of the freedom movement. But until the GNS turned to the Supreme Court in April 1995, these campaigns had resulted in little else than paper and occasional police beatings and arrests.

The writ petition in the Supreme Court was not the first GNS attempt to move the judiciary. There had been several cases of public interest litigation in the Calcutta High Court. Most of these had been frustrating experiences. For instance, the high court had stayed plans to build a commercial complex in Bellilious Park in the late 1980s. The case was never settled. The private investor eventually shied away from the project during the long-drawn proceedings. Subsequently the local authorities had allowed the once beautiful park to decay and become an informal garbage dump.

The most spectacular GNS case in the high court concerned the Howrah Maidan, the city's central park. The GNS had, in early 1989, filed a petition against the construction of a massive auditorium at this location, arguing that the maidan served social and environmental needs. The high court stayed the project. In 1991 it ruled that there could be no permission to build the auditorium as long as a civil defence remained on the maidan's eastern end. This camp should be removed and its space be made a public park again. This was what an expert report by the All India Institute of Hygiene and Public Health had suggested.

The authorities ignored the judgment. Construction work went on with the civil defence camp still in place. In early 1995,

a high court judge therefore found the mayor and the district magistrate of Howrah guilty of contempt of court. Again this had no consequence. Both officials appealed to a division bench. The case did not come up for hearing and construction continued.

For Subhas Datta's GNS, taking state authorities to the high court had thus proved a futile exercise. In 1995, the GNS secretary decided to go to the Supreme Court. In the writ petition, he stated that the earlier GNS matters had been "delayed by the usual process of the high court" with the result that the civic authorities had in the meantime caused "permanent obstruction". The petition suggested that the high court needed a specialised 'public interest litigation bench' to guarantee 'speedy trial'.

The writ petition itself was a massive piece of work. It listed many complaints concerning Howrah's lack of civic amenities. These issues were argued on 81 pages. Including evidence provided in the annexures, this document filled 439 pages. The petition asked the Supreme Court to order the authorities.

- to restore all greeneries,
- to stop the felling of trees,
- to systematically monitor and prevent pollution,
- to cancel illegal allotments of public property to private firms,
- to clear garbage in Howrah (particularly from the fish market),
- to provide wholesome drinking water,
- to stop disposal of untreated sewage in the Hoogly river,
- to maintain all public parks (including the Maidan) properly,
- to keep the police morgue in a clean and hygienic manner,
- to stop the unplanned growth of high-rise buildings, and
- to submit all documents relating to urban development.

The Supreme Court accepted the matter (Howrah Ganatantrik Nagarik Samiti vs the State of West Bengal). It soon passed another stay order concerning the – by now almost finished – construction of the Maidan auditorium. This time, the authorities obeyed – apparently fearing the apex court might hold officers guilty for contempt of court.

On April 4, 1996, the Supreme Court passed a judgment based on the notion that environmental issues were "to be given utmost priority by the courts" in India. The Supreme Court itself claimed to be overburdened with such matters. This resulted from the fact that specific legislation was hardly implemented on either central or state levels. Concerning Howrah, the order stated that this complex matter would better be dealt with by the Calcutta High Court "because of the distance and various other problems". The high court was directed to establish a special bench which would "consider and deal with environmental and pollution control matters including the present petition".

Two months later, the new division bench (soon to be called the 'green bench') took up work in the high court. In September, its two judges paid an official visit to Howrah. On site, they found most of the claims made by the GNS to be correct. Since then, proceedings have been going on slowly but continuously. Unlike earlier GNS cases in the high court, they have led to visible results on the ground floor level. The most striking single issue of the Howrah Matter was the terrible condition of the police morgue. For years, dead bodies had simply been piling up in the backyard of a police station in central Howrah. In the early 1990s, up to several hundred corpses could be found rotting under the open sky. Occasionally, vultures would carry limbs from the compound and even drop dead flesh on city streets. Newspapers had reported, neighbours had staged rallies, the GNS had tried to pressurise the administration. Nevertheless the scandal had continued.

In the summer of 1996, the two judges of the green bench visited the morgue. Many court sessions later, in early 1997, they passed a comprehensive judgment. They ruled that the dead bodies would have to be cremated at least weekly. There would have to be an airconditioned room to store the dead instead of leaving them to rot under the open sky. Cremations have since taken place regularly. By November 1997 there was a new morgue building. In the summer of 1998, it finally had an operational ac system.

Undeniable progress was also made in the case of Howrah's fish and betel markets. These had for decades been held on a provisional site close to Howrah station. India's biggest wholesale market for seafood had neither an adequate system of garbage clearance nor of drainage and waste water disposal. Accumulating waste had blocked an entire road to traffic. An earlier high court order to open it had been of no avail. Daily floods, caused by melting ice, exacerbated the dirty mess. Vendors use ice to cool the fish.

This situation seemed all the more scandalous as a new market complex had been built years before. But it had never been used because of several pending litigations concerning stall allotments. The green bench took up this matter, settled the legal disputes and ordered the fish market to relocate and clean up the area. By late 1997, the vast majority of fish vendors had moved to the new complex. The formerly blocked street was open to traffic again. There were still problems with drainage but they were not as severe as they had been at the provisional site. A small fraction of the fish stalls and the betel market had yet to relocate to a completely new site.

The green bench also took up the question of the auditorium on the Howrah Maidan. In early 1997, it argued that this project should be finished because much money had already been invested. The judges did not punish anyone for contempt of court. Even though they would have had perfect reason to do so, they did not assert the authority of the judiciary. Rather they legalised facts which had been accomplished against explicit orders of the high court. The judges did, nonetheless, insist on the removal of the civil defence camp – which subsequently occurred. Also they strictly outruled any commercial use of the auditorium or its conversion into a cinema hall as had happened with an earlier corporation-run auditorium.

On another large part of the Maidan, a stadium had come up. Subhas Datta had also challenged this scheme in the writ petition, emphasising that the outer side of the galleries had been rented out as commercial shops. There was reason to believe that these businesses had bribed officers. The green bench did not hear this matter in its first 18 months. Nonetheless the city authorities had – on their own initiative – unlocked the gate to the playing field. By the summer of 1997, this area and the plot of the civil defence camp were accessible again. Before the green bench took up work, the entire Maidan had been closed to the public.

The green bench further interfered to some effect with two informal, large-scale garbage dumps. Bellilious park and a vast space underneath the second Hoogly bridge had been systematically abused as landfills by city contractors. After respective orders of the green bench, this practice was discontinued in 1997. However, these places were not turned into well-maintained public parks as had also been demanded by the judges.

For the GNS, such successes are undeniable. However, moving the court is no easy road to relief. All locations need constant monitoring. While court orders are now normally adhered to in at least symbolical way, they are rarely enacted in a literal sense. Taking the state to court remains a repetitive, cumbersome and

piecemeal process. Ground floor success tends to be of an only partial nature.

Moreover, the green bench did not tackle several serious issues during its first 18 months. These included

- the uncontrolled growth of high-rise housing in the city centre,
- everything relating to waste water disposal through open drains,
- the provision of safe drinking water,
- dust, air and noise pollution due to traffic on ill-maintained, narrow roads.

More generally speaking, the green bench had not dealt with the issue of urban planning. It had not tackled the core problem of Howrah's (and the entire agglomeration's) environmental crisis as diagnosed by the CMDA itself in 1990 and 1992.

Progress in the Howrah Matter may remain slow – but it is not limited to this city. After the case of the Howrah morgue was dealt with, the similarly terrible conditions of other morgues in West Bengal were brought to the attention of the high court. In the summer of 1998, court sessions concerning the comprehensive number of almost 50 morgues in the state were being prepared. The green bench had set a precedent in Howrah on what was no longer to be considered acceptable and now seemed ready to apply the new standards to all of West Bengal

Another effect of the Howrah Matter has been that more and more citizens approach the green bench, often after seeking advice and support from Subhas Datta. They have discovered that the mere threat of going to court may now set the local administration in motion. In Howrah, where citizens had hardly ever seen the local government as anything but a corrupt network of self-serving thieves, the green bench has introduced the principle that the government has duties to perform. Today, several dozen major cases (many of which argued by Subhas Datta) are pending before this judicial body. They tell of the rising interest in using public interest litigation to establish a sense of public sphere in West Bengal

Nevertheless, efforts to sue the government or polluting industries may still be in vain. Some cases were not accepted by the green bench. Others, simply were not listed in spite of having been accepted. Even for regular observers, the decisions of the green bench seem unpredictable and almost erratic.

Summarily, it will have become evident that the green bench has given citizens and their organisations some leverage over the local government. This is the place were high-ranking officials may be forced to publicly elaborate on their bureaucracies' doings. While public interest litigation still does not inspire trust in the branches of government, it does give rise to hope for relief from grievances. This will also become apparent in the second major complex of environmental court activism.

II
The Disputes over the East Calcutta Wetlands

Calcutta is located on the western end of the Ganges delta. The landscape to the city's east and south-east is dominated by ponds, swamps and low lying, flood-prone land. In a general sense, all this territory consists of wetland area. It is not fit for urbanisation. Briefly summarised, the main reasons are:

Water: Most of the land is flooded in the rainy season. Effective drainage would be difficult and very expensive. On the other hand, provision of drinking water would also be problematic. Groundwater is scarce. Should too much be extracted, the aquifiers are likely to become saline [Sinha 1985, 1988].

Biodiversity: There are many varieties of birds that breed in the east Calcutta wetlands. They depend on these biotopes [Ghosh 1991]. The multilateral Ramsar Convention (to which India adheres) calls for their protection. Environmentalists are campaigning for this goal internationally.

Waste recycling: A massive waste recycling scheme has informally come up in large parts of the wetlands. Vegetable farms have been using composted garbage as fertiliser since the end of the last century. In the 1930s local pisciculturists began growing fish in urban waste waters. The schemes basically serve as a giant biological treatment plant for organically contaminated garbage and waste water [Furedy 1987; Ghosh and Sen 1987; Ghosh 1991; Ghosh 1993, 1996]. While experts acknowledge some problems of food contamination (for instance with heavy metals), they in principle believe this system to be a very good solution for a mega-city in a developing country [CEMSAP 1997].

Livelihood: The wetlands have a two-fold relevance for poor people's livelihood. One: they provide employment for 10,000 of villagers involved in agriculture and pisciculture. Two: fish and vegetables from the wetlands are among the cheapest in Calcutta's markets. Transport costs are minimal as production takes place on the city limits [Ghosh 1993; IWMED 1995].

Accordingly, government plans outruled eastern and south-eastern expansion of the metropolis for decades [CMDA 1990; State Planning Board 1990, Dasgupta et al 1991]. Nontheless, the state government had also pursued one project that did not confirm to this policy. The township of Salt Lake City had been built on reclaimed wetlands. With ample space and good commercial facilities, it is now one of the agglomeration's fancier neighbourhoods.

However, the experience of this township also shows that the above-mentioned concerns are to be taken seriously [Chattopadhyaya 1990]. There are problems of flooding as well as that of provision of drinking water. The growth of Salt Lake City has led to a loss of fish ponds and agricultural land. Villagers were uprooted and dislocated [Chattopadhyaya 1990; Kundu 1994].

With the exception of Salt Lake City, the West Bengal authorities have generally protected the wetlands. However, the government is not organised in a way that would allow it to deal with the issue efficiently. In 1988, seven departments of the state government, along with its wastelands development board and four bodies of the central government had stakes in these wetlands. They covered areas in the Calcutta corporation and two neighbouring districts. Large sections, but not all, fell within the competence of the CMDA.

This fragmentation of governmental jurisdiction led to serious management problems as assessed by the Institute of Wetland Management and Ecological Design [IWMED 1988:9]. This expert body was set up by the state in the early 1980s, but it never obtained the statutory powers needed to fulfil the tasks defined by its name. It basically remains a research institute.

In the late 1980s, it was becoming obvious that official governmental policies concerning east Calcutta were no longer to be taken at face value. By 1991, the list of newspaper reports about development projects on Calcutta's east side had become quite long. The construction of the eastern metropolitan bypass had made the area easily accessible. It had become attractive for real estate speculation. This was in stark contrast to the well-argued (and documented) reasons not to urbanise this territory.

A network of environmentally minded bureaucrats began to feel that they were loosing the inner-governmental struggle to protect the wetlands. They briefed urban NGOs and motivated them to start a campaign to raise awareness. These NGOs, however, could not mobilise a mass movement. In the wetland area, social strife and labour unrest made concerted grass root opposition to development schemes unlikely. With both overt and

covert support from individual bureaucrats, the urban NGOs finally decided to take the matter to court. In early 1992, a pressure group called PUBLIC (People United for Better Living in Calcutta) filed a writ petition in the high court.

Public vs the State of West Bengal

PUBLIC based its demands on the expertise of its bureaucrat allies. Several photocopies of governmental documents were annexed to the petition, most of which were not normally available in public. The court was asked to direct the authorities to protect the wetlands. They should set up an institution for this purpose. The petition included a map of the 'waste recycling region' which had been drafted by the IWMED some years before. For the first time, the term 'east Calcutta wetlands' was legally equated with the 'waste recycling region'. This use of the term is confusing as not all wetland areas are covered by the 'waste recycling region'.

The high court accepted the case (PUBLIC vs the State of West Bengal) and began to look into the matter. Proceedings went on fast. It became evident that the petition was in tune with central government's wetland protection policy and the international Ramsar convention. It also turned out that the state government had not finalised any development plans for the mooted projects. These included (among others) a world trade centre, a permanent ground for trade fairs and exhibitions, a new zoo and a south-ward expansion of Salt Lake City.

On September 24, 1992, high court justice Umesh Chandra Banerjee delivered the first major judgment on the matter. He ruled that the wetlands were "a gift of nature". He defined it as the court's job to "strike a balance between development and environment". According to him, wetlands could only be reclaimed for development projects that would benefit society at large. In principle, a world trade centre and a permanent fair ground would fall in this category. Both were likely to serve as motors for eastern India's industrial and commercial development. The wetlands, on the other hand, were stated to be too precious to be sacrificed for a mere township.

The ruling did not simply permit any projects. Rather it stressed that the authorities had not come up with any detailed plans. This meant that the proposals were still in "a state of fluidity". The judgment also emphasised that the CMDA itself had not approved of eastern urban expansion in its 1990 document. This was considered to be crucial as the CMDA was the responsible planning authority.

The judge decided to give the state one year's time to return to the high court with detailed plans concerning a world trade centre and an exhibition ground. For these two schemes, an area of almost 190 acres could in principle be earmarked in the wetlands. However, no other development projects would be permitted in the area of 5,500 hectars outlined by the map of the waste recycling region. For PUBLIC, this was a major success.

In retrospect, however, it is clear that this judgment opened all the other areas on Calcutta's eastern fringes to development which, as stated above, also qualify as wetlands. The judgment also failed to provide an authority with encompassing powers to manage the wetlands. Finally, the high court had not paid attention to urban planning as defined by the West Bengal Town and Country Planning Act (1979) with its emphasis on outline development plans.

Within the next 12 months, the private company, Development Consultants Ltd (DCL), approached the high court with detailed plans for a world trade centre. It was acting on behalf of the state government. Another year later, on November 30, 1994, justice Banerjee passed a second judgment concerning the world trade centre. It repeated the notion of "striking a balance between environment and development" and alotted 73 acres of wetland territory south of Salt Lake City for the world trade centre. As there had been no further application to build a permanent exhibition site, this aspect was disposed of for good.

PUBLIC, however, immediately appealed against the world trade centre decision. Procedings have since been dragging on slowly. In early 1998, the core facility was being built on the borders of the disputed area with DCL prepared to extend the complex into the waste recycling region as soon as so permitted by the court. The area in dispute amounts to less than 1 per cent of the protected area. Its relevance for the ecological balance should not be exaggerated. Rather, it is important to stress that the high court rulings have remained consistent since the very beginning. Rumours among Calcutta's environmentalists accuse the high court of having reversed its initial anti-government stance by later permitting the project.

M C Mehta vs the Union of India

In the mean time, another case affecting the east Calcutta wetlands was being dealt with in the Supreme Court. This was the 'Ganga Matter', filed by Delhi-based environmental lawyer Mahesh Chandra Mehta in 1985 (M C Mehta vs the Union of India). Initially, this case had concerned the tanneries in Kanpur. Later, the scope was extended to cover all industrial pollution of the Ganges.

On December 12, 1996, the Supreme Court passed a comprehensive judgment concerning the Calcutta tanneries. Their case had been dealt with in the Supreme Court for a period of almost four years. Apparently, both the state government and the tannery owners had been dragging their feet. After all, the tanneries are an important factor of Calcutta's economy. They employed some 10-15,000 workers. At least another 1,00,000 jobs in the leather trades depended on them. Neither employers nor employed were in favour of moving.

Nonetheless, in 1992 the state government had proposed to set up a new leather complex at Karaidanga, roughly 20 km east of the city centre. In its final judgment, the Supreme Court ordered to do so by September 1997. As there was no space to set up adequate effluent treatment schemes in the traditional tannery neighbourhoods of Tangra, Tapsia and Tiljala, these businesses could no longer be allowed to operate there. The new leather complex would be equipped with a common treatment plant. The state government would bear some of the costs and the tanneries would later pay for its services so that this solution was considered to be financially viable.

The Supreme Court was dealing with the issue of pollution. It did not delve systematically into questions of urban planning and of wetland protection. The result is that, according to PUBLIC and others, the leather complex location at Karaidanga is within the waste recycling region. The tannery owners had brought up the argument of the high court ruling in the Supreme Court. The state government denied that the protected area would be affected. However, individual members of the bureaucracy still claim that the place is indeed judicially protected territory.

The Supreme Court's decision was not implemented in time. By Christmas 1997, only a half dozen businesses had shifted to Karaidanga. However, large-scale construction works were underway and progressing fast. The road to Karaidanga was being widened. While some people in the leather industries believed relocation would take another ten years, the recent developments did suggest that the state government was eager to get ahead with the project.

with concern to the general wetland problematic, this is highly ambivalent. On the one hand, tannery effluents are contaminated with toxic heavy metals. They will no longer be channelled into the wetlands. This practice has long since affected the safety of food production in the waste recycling region. In this sense, the relocation of the tanneries seems desirable.

On the other hand, there has been no environmental impact assessment deserving the term. The leather complex will need water. It is unknown how this will affect the delicate ecological balance of the waste recycling region. Additional traffic on a by now widened road through this protected area is, of course, also no blessing for a fragile environment.

Most disturbingly, the question has not been legally resolved whether the leather complex and waste recycling region overlap or not. The map used in the high court judgment is of inadequate scale to determine this. PUBLIC approached the high court in 1995 for a clarification. The NGO made the serious charge that state agents were guilty of contempt of court. One might expect the high court to assert its powers by dealing with PUBLIC's accusations after having assumed the authority to protect a certain area of the wetlands in repeated judgments. Nonetheless, the matter was kept pending.

The Supreme Court, on the other hand, had only dealt with the wetland question briefly and was apparently shown a different map rather than the one used in the high court. Neither map is publically available. They are included somewhere in unpublished court files. Even the Geographical Survey of India maps of the area have been unavailable throughout the 1990s. Therefore, the issue remains totally intransparent. This undermines the authority of the judiciary. The situation inspires rumours and speculations but not trust in any branch of government. The general public is deprived of verifiable information.

This does not mean that the high court's protective ruling had been totally uneffective. With the possible (and noteworthy) exception of the leather complex, all other new construction projects in the waste recycling region have been discontinued. In spite of rampant rumours about massive real estate speculation going on in the waste recycling region, the area seemed fairly well protected in the winter of 1997-98. This had, however, required constant monitoring by PUBLIC. The NGO had brought several projects to the high court's attention which were then abandoned without further judgments.

Such success may well be related to the fact that wetland protection was always also the goal of some people within the government. In a certain sense, PUBLIC had been representing them in court. They could not be involved themselves in a litigation against their employer, the state government.

Indeed, after the high court ruling of 1992, the environmentalist network in the bureaucracy was making some headway again. The state government officially proposed to the central government to declare some wetland areas in east Calcutta

as being of both 'national' and 'international importance'. This would legally imply conservation. However, neither proposal has so far been finalised.

Surojit Srimani vs the State of West Bengal

The exclusive protection of the waste recycling region has one major drawback. Those eastern fringes of the city not covered by the high court's order have since been exposed to rapid, inadequately planned urbanisation. This was highlighted by a third case of public interest litigation (Surojit Srimani vs the state of West Bengal).

In May 1995, an informal group of 22 friends wrote a letter to the chief justice of India begging the Supreme Court to control Calcutta's eastern sprawl. This appeal again mentioned several state government documents as evidence. The Supreme Court did not take up the matter but referred it to the high court. Here it was first heard by a single bench in the first half of 1996 and then transferred to the new green bench in the summer of that year

The petitioners listed a series of projects coming up near the eastern metropolitan bypass. These included a convention centre and exhibition hall ('Science City'), a craft's village, a film training centre, new townships and industrial estates, a hospital, a five-star-hotel and an energy park. The petitioners also pointed out that the CMDA itself had not published the outline development plan demanded by the West Bengal Town and Country Planning Act (1979). The CMDA itself had not recommended the area around the eastern metropolitan bypass for urban growth in its programmatic document of 1990. According to the petitioners, the authorities were thus 'systematically violating' state norms.

The green bench did not pay much attention to these arguments. This is remarkable. Justice Umesh Banerjee, its senior member, had in his 1992 ruling regarded the CMDA document of 1990 as legally binding This paper had not referred to the waste recycling region but had found all of Calcutta's east unfit for urbanisation. Now, this paper was declared a policy statement rather than a planning document of binding nature.

The petitioners demanded that the authorities elaborate on why their assessment of the geographical conditions had changed, but the green bench did not hear the matter anymore. Rather, it accepted an unpublished CMDA paper as legally adequate plan. This had apparently been drafted in haste (and quite likely too late, when construction was already going on). Shortcomings of urban planning, so crucial for the agglomerations environmental crisis, again stayed untackled by the judiciary.

What caught the judges' attention was something else. 'Science City', by then almost completed, had been built on a former garbage dump. There was a risk of methane accumulating and catching fire. To deal with this danger, the green bench ruled on October 11, 1996 that the levels of methane in the air of the compound would have to be measured every six months. Sadly, this is useless from an engineering point of view. Methane is dangerous when accumulating underground but not when dispersed in the air. The green bench had thus passed an order which only symbolically tackled the risk involved. The green bench paid less attention to the science city than its senior member, sitting alone, had paid to the environmentally less problematic world trade centre.

As in the Howrah matter, positive consequences of public litigation are undeniable in the case of the east Calcutta wetlands. The waste recycling region has been quite effectively protected. The tanneries are being forced to do something about their effluents. However, the geographically incorrect, legal equation of 'wetlands' with 'Waste Recycling Region' diverted attention from the issues of urban planning. The possible conflict between the judgments of the high court and the Supreme Court remains irritatingly unresolved.

IV
Conclusion

The case studies suggest that the judiciary as a whole is muddling through rather than applying an overarching, consistent body of law. This is exacerbated by the fact (not elaborated on here) that changes of judges may radically change the course of proceedings. Individual bench members dealt thoroughly with some issues and seemed eager to dispose of other questions quickly.

Even aspects of strictly procedural nature are surprise-prone. Appeals to the Supreme Court resulted in session before a new environmental bench in the high court which, in itself, was a radical innovation of the normally not specialised higher Indian judiciary. Neither judicial tier has been overactive. They did not assert their authority by punishing officers for contempt of court, even though both occasionally (with good reason) threatened to do so. Enforcement of judgments remains unpredictable and erratic.

It would be wrong to simply blame individual judges for this state of affairs. Their task of setting administrative shortcomings straight is daunting. As has been scholarly discussed, environmental legislation is often not realistic in India, consisting more of propagandist promises than of pragmatically implementable programmes [Khator 1991; Gadgil and Guha 1995].

In this context, it is worth keeping in mind that environmental challenges are always among the most difficult any polity faces. This is the reason why they are good test cases to investigate questions of governance in general. Environmental matters affect economy, culture, social habits and security, traditions and the distribution of incomes. Even in countries much richer than India (Germany for instance), the policy arenas are haunted by fancy rhetoric followed up by merely symbolical, ineffective measures.

However, the gap between what is official legislation and what occurs on the ground floor level seems to be particularly wide in India. This is related to the shortcomings of the public sphere. For the citizens of the Calcutta metropolis, both the judiciary and the administration appear as two almost-absolute powers which occasionally compete for dominance. For non-governmental activists, it is all but impossible to check either of them. They remain beyond reach and highly intransparent.

This has many aspects. One is the fact that both commonly use a foreign language, English. Moreover, administrative as well as judicial files are kept secret. Only the most innovative judgments are reported in the law journals. Many important court documents remain publically inaccessible. The same is true of relevant government reports and papers relating to urban planning and environment. Occasionally, they may leak out. In this context, it becomes a personal favour if bureaucrats or judges take up any particular cause. In everyday life, it is not an inalienable, reliable right of the people to be heard by the authorities.

Just as legislations or policy statements are not always followed up by action, so court rulings are not necessarily implemented. This is again not simply the consequence of personal wrong-doing or incompetence. Many government agencies are inadequately staffed, equipped and organised to do their jobs properly.

For instance, the West Bengal Pollution Control Board only has a technical staff of 25 to check pollution in a state with almost as many people as reunited Germany

ınd with the oldest industrial base in Asia. Nevertheless, the green bench relies on his agency's reports. By trying to make he state Pollution Control Board its nvestigating agency, the high court judges ıave increased its workload and added to ts already overburdened agenda. Consequently, Pollution Control Board reports ıre often of a rather dubious quality.

As far as the CMDA is concerned, a nuch more powerful institution, there are other systematic problems. It is not responsible to the democratically elected municipal bodies it is supposed to plan for. Rather, the CMDA reports directly to the chief minister who is dealing with a much vaster electorate than the municipal bodies concerned. The CMDA is thus removed from its immediate political constituency.

Moreover, the CMDA is entrusted with both devising and implementing urban planning. This eliminates an important stage of control. Consequently, the CMDA s not performing either task satisfyingly. For the citizens of the metropolitan district, he CMDA is not so much a democratic nstitution serving the public as an authority weilding arbitrary, almost absolutist, powers.

This sense of intransparency in what should be an element of the public sphere s reflected by a lack of trust and cooperation among the various NGOs. Stereotypically, other NGOs are accused of being incompetent and corrupt, of not having any grass roots contacts and not seriously caring about the environment. Different groups eye one another with suspicion. Others might only be trying to gain an unproportionate claim to fame or be angling for foreign funds. This weakens civil society in confrontation with the government and further reduces the sense of public sphere. Closer co-operation for instance in order to monitor the implementation of court orders) would lessen the NGOs' workload.

Of course, it is difficult to bridge all gaps stemming from divisions of caste, religion, language, etc. But there is a serious argument against explaining the problematic aspects of Calcutta's civil society along the lines of Indian communitarianism: the people involved in public interest litigations are almost exclusively upper caste, English speaking, educated, middle class Bengalis. Most judges and government officers share this background. Apparently, they face tremendous problems of co-operation within their own social stratum. Perhaps there would be a stronger sense of trust in civil society if interaction with government bodies was more reliable.

Strengthening the public sphere would, in any case, enhance the political potential of civil society. The empirical evidence of Calcutta thus supports the programmatic approach of the Berlin-based network 'transparency International', which, after the model of Amnesty International, wants to tackle corruption and criminal governmental negligence. To put it another way, the undeniable problems of (at least formally) democratic governance in Calcutta seem to be typical of an arrogant, post-colonial attitude displayed by state agencies. They do not simply derive from the problems of a multicultural social fabric.

In this sense, my modest advice to individual judges who want to improve governance by using their considerable personal power would be to make bureaucracies more transparent. They could order officers to publicly elaborate on the doings of their agencies and then take them by their word. The judiciary can not solve all technical, economic, social and other questions related to environmental problems. But it has scope to provide more transparency and more responsibility – in the very literal sense of making those in charge respond. If successful, this might over the long run not only inspire hope but also encourage trust in the democratic state.

New Fertiliser Policy: A Practical Approach

Sanjay Kumar

The fertiliser industry rejected the report of the Hanumantha Rao Committee on pricing of fertilisers on the ground that a uniform pricing policy cannot be applied to an industry that is so heterogeneous in its structure due to various factors which were exogenous to the industry. This article examines the arguments of the industry. It also examines the recommendations of the committee and tries to meet some of the valid criticisms of the industry and work out a modified price following the long-range marginal costing principle. The new price will improve the acceptability of the report and encourage new capacity addition.

IN the light of the recommendations of the Hanumantha Rao Committee on fertiliser pricing policy and reactions of the fertiliser industry, there are some questions which need further discussion. The discussion is imperative because fertiliser is a key industry having large investments and use of fertiliser is key to increasing foodgrain production. But large subsidy on fertiliser may not be sustainable for a resource-starved government. The following questions are relevant in this respect:

- Can there be a uniform price for a heterogeneous urea industry? Is the heterogeneity of the industry not a product of the RPS? Does LRMC pricing address issues relating to efficiency and viability?
- Should there be an exit policy? What can be the elements of an exit policy?
- Study of resource cost of the fertiliser industry indicates absence of comparative advantage. Does this imply that India should adopt a pragmatic approach to the objective of assured supply by reducing its domestic production and import either through long term buy-back arrangements or set up joint ventures abroad for buy-backs? But given the uncertain external political conditions, how sustainable can this be?
- The committee recommended structuring of the existing and the future industry on natural gas and, in its absence, on LNG. But so far there has not been any progress in the work relating to making LNG available. Is LNG the feedstock for a distant future? What steps should be taken to mobilise the huge funds and backward/forward linkages required for setting up LNG facility? Is naphtha a better option than LNG, given a marginal difference in the energy efficiency between the two and the additional huge investment required for setting up LNG facility? What are the comparative trade-offs between the two?

In this paper an attempt has been made to understand the implications of the Hanumantha Rao Committee's report for the domestic production of urea, which at present is under the administered price regime. The paper also analyses some of the criticisms of the report by the industry and suggests changes that may be needed to take care of some of the valid criticisms.

Overview of Fertilizer Industry

The Indian fertiliser industry has grown rapidly over the years. It has supplied the bulk of the growing demand for fertilisers. From a very high level of 80 per cent of import in 1966-67, imports have gone down during the last few years. At present, the self-sufficiency level in fertiliser production is 86 per cent. Production of urea in 1951-52 was 63,000 tonnes, which increased to 194 lakh tonnes in 1997-98. The NPK consumption in the country in 1950-51 was only 69,000 tonnes, which increased to roughly 14.5 million tonnes in 1996-97. High level of domestic production and consumption has enabled the country to achieve substantial increase in foodgrain production. From 74 million tonnes of foodgrain production in 1966-67, production in 1997-98 was close to 195 million tonnes.

Large increase in consumption as well as production of fertilisers has largely been possible through concerted policy push by the government to subsidise consumption. The producer pricing system in 1977 based on cost-plus approach called Retention Price-cum-Subsidy Scheme (RPS) encouraged indigenous production and made it possible for the government to provide fertilisers to the farmers at affordable price.[1] Availability of fertilisers to the farmers was ensured through a system of reimbursement of incurred freight cost. Though the freight cost reimbursement system is considered concomitant with the RPS, it is a separate scheme called equated freight scheme. Though laudable in terms of achievement of goals, the subsidy outgo on account of fertilisers increased from Rs 170 crore in 1980-81 to Rs 8,350 crore in 1997-98.

The economic reforms started in 1991 called for review of industrialisation policy in the country. The regulatory system, which hitherto prevailed in the fertiliser sector, needed it to be replaced by a policy based on evaluating make-buy options based on relative costs of imports and domestic production of urea. Further the budgetary subsidy over a period of time since introduction of the Retention Price Scheme had grown to more than half of the central government spending on agriculture and to about 1 per cent of GDP. This put the government budget under unacceptable strain.

A start was made by the government in August 1992 to move away from the highly regulated system and reduce the subsidy by decontrolling phosphatic and potassic fertilisers. Partial decontrol of fertiliser sector led to sharp increase in the prices of P and K fertilisers. Since nitrogenous fertilisers became relatively cheaper, a sharp fall in consumption of P and K fertilisers further skewed the none-too-favourable NPK balance prevailing before the decontrol. The NPK ratio prior to decontrol was 5.9:2.4:1 (the accepted ideal ratio being 4:2:1). This became 9.5:3.2:1 after the decontrol. Freeing of imports brought down the prices of DAP, but made the domestic industry unviable. The government was forced to introduce a system of subsidisation on the basis of sales, called ad hoc concession scheme. This scheme was aimed at reducing the prices paid by the farmers. The scheme was to be initially for one year with a provision of Rs 340 crore. Later on it was extended and its scope was also widened to introduce differential subsidy on domestic production and imports.

The above changes did not result into containment of fertiliser subsidy – in 1991-92, the subsidy on P and K fertilisers was Rs 1,326 crore and the same in 1997-98 was Rs 2,052 crore. Halting, contradictory and incoherent changes resulted in policy uncertainty impairing further growth and investment in the sector. To take a fresh look at the problems of the fertiliser sector, the government instituted an Expert Committee under C H Hanumantha Rao, former member, Planning Commission, to suggest either an alternative pricing mechanism or corrections for removing some of

the deficiencies of the existing pricing system. The committee submitted its report in April 1998 and recommended far-reaching changes.

RPS In Existing Urea Units

The committee, while noting the positive aspects of the RPS system in providing secure environment for investment and production, found a number of deficiencies in the cost-plus approach and recommended discontinuation of the same. The committee felt that some units had been understating their nameplate capacity to take undue advantage of the pricing system. The basis for suspecting such a possibility lay in the exceptionally high rates of capacity utilisation achieved by the units.[2] The incentive was that if a unit achieved a higher capacity utilisation it could substantially raise its return on net worth as the capital charges receivable by the units were fixed at 12 per cent post-tax ROR on net worth at 90 per cent of capacity utilisation. Though there was no justification for CRC (capital related charges) payments above the assessed level as the plant recovered its full investment at this point, the committee concluded that the present system of CRC conferred a differential return. It rewarded high cost units with high CRC even if they were inefficient in other terms so long as they produced above assessed levels of production.

The committee observed that the scheme relied on claiming and proving the costs and there was no approach for adopting a normative basis for pricing which could lead to an energy efficient industry. There was no incentive for innovation or incentive to encourage energy efficiency.[3] The discouragement to adopting energy efficiency measures arose because the producers' price was calculated on the basis of historical cost data. If historical data for consumption of feedstock or fuel were high, the unit's price was higher. Any gain of innovation or adoption of energy efficiency measures were mopped up eventually, discouraging such measures.

The committee also felt that the cost-plus content of the RPS affected the decision-making process of the government for fixing prices also. Since the cost-plus approach resulted in an ever-increasing subsidy bill with no possibility of a cap, most of the decisions were taken with a view to containing the subsidy in an arbitrary and ad hoc manner. This style of decision-making put industry to undue hardship and resulted in cases of under-recovery. The committee felt that the cases of underrecovery were only to the extent of 2 to 3 per cent. But the industry felt that the underrecovery was much more than that, coupled with delayed payments.[4] It is therefore to be understood that the distortions pointed out by the committee were inherent in a cost-plus approach and it may not exactly be worthwhile to establish cause and effect relationship.

RPS did not envisage any exit policy for inefficient units. The emphasis was on production, rather on the cost of production. A study[5] of the resource cost of the industry suggests that about 10 per cent of the current urea production is uneconomical at import parity price[6] of US $ 163 per MT and should therefore be replaced. Most of the units, which are uneconomical, are based on naphtha and coal. (In fact all coal-based units are uneconomical, their retention prices being more than Rs 10,000 per MT but the total quantum of production from these units are very low; the units being sick.)

Unrestricted entry of high cost producers and inability of old or sick units to generate surpluses to modernise themselves led to creation of a heterogeneous industry. The committee also felt that "RPS militates against economic efficiency" and there was need for adoption of normative project costs and operational efficiency norms to bring about significant gains in productivity and competitive fertiliser prices which encourages cost reduction efforts. The committee therefore recommended a uniform producer's price on the basis of long range marginal costing (LRMC) principle for the urea units and calculated producer's price of Rs 6,050 per MT for all the existing gas based units. The committee also established that the most efficient feedstock for production of urea is natural gas and in its absence liquefied natural gas (LNG). For the existing fuel oil, naphtha and coal based units, it recommended a fuel based compensation called feedstock differential cost reimbursement (FDCR) for a period of five years. In this period the committee expected these units to restructure themselves. In a way, this was an exit policy for the non-gas-based units.

For the new units, the committee was of the view that only gas-based and LNG-based units should be set up. Since the cost of production from these units was to be in the range of Rs 7,000 per MT for gas, and Rs 8,300 per MT for LNG, the committee suggested that the government should review its policy from time to time. In case it wanted to attain a particular self-sufficiency level of production, it could give appropriate incentive for setting up of plants.

Response of FAI

The Fertiliser Association of India (FAI) rejected the recommendations of the committee.[7] The association felt that the committee gave a simple solution to a rather complex industry. The complexity of the industry arose from usage of different feedstocks made available to the industry at various points of time during its growth. Feedstock sources determined the location choices of the plants. These factors were largely exogenous to the industry. The industry felt that the government, which so far had a major role in guiding the growth of the industry, should not abdicate its role without providing a viable alternative. The FAI contended that the recommendations, if accepted, would hurt 65 to 70 per cent existing domestic production. On the recommended prices this production would become unviable. This may not be appropriate given the huge outgo of foreign exchange required to make good the shortage from the international market. Reduction in fertiliser consumption due to disturbance in production would also have an adverse effect on foodgrain production, the FAI argued.

Industry felt that there was no flaw in the RPS. The problem was in the way it was implemented. The FAI stated that the committee misjudged the problem of implementation as a flaw in the system and recommended its dismantling.[8] If however some of the problems of the existing RPS are corrected to bring in proper implementation to minimise delays and arbitrariness, RPS could still be the right system, the FAI suggested. The FAI also demanded returns as available in other industries, particularly in power, for the objective of attracting investment and creating an efficient industry

Heterogeneous Structure of Urea Industry

The industry rejected the uniform pricing mechanism for urea on the grounds that it disregarded the heterogeneous character of the urea fertiliser industry with plants differing widely in respect of feedstock, vintage, location, technology, investment cost, financing pattern, etc.[9] The industry argued that it was these factors of feedstock, vintage, location, technology, etc, which led to differences in the cost of production. But then the sector had some very modern plants also whose consumption ratio was comparable to any world class production facility. These are some of the recently commissioned plants, like Tata Chemicals at Babrala, Chambal

Fertilisers at Gadepan and Oswal Fertilisers at Shahjahanpur.

While existence of efficient units cannot be overlooked, it is some of the very old plants, like Duncan's plant at Kanpur, FACT's plant at Cochin, coal-based plants of FCI and plants of HFC (HFC and FCI are two sick PSUs in the fertiliser sector), which are cause for worry. These are almost fully depreciated plants with very low capital related charges, in the range of 5-7 per cent of the retention price. Their retention prices are in the range of Rs 9,000 per MT to Rs 10,000 per MT. Thus most of the costs of these plants are going towards variable cost and conversion charges, leaving little to generate surplus for carrying out investment which can be used to bring about energy efficiency. These plants would not have survived in a market system. They survived because the RPS did not envisage any exit policy. Any cost of production was supported in this cost-plus pricing regime, so long as the unit could produce fertilisers. This dispensation therefore has resulted in a number of plants having wide diversity in the feedstock choices, energy efficiency, etc. A market system or a uniform pricing system in some manner would have enforced a self-correction. The question, which now becomes relevant in this context is whether we should continue a system which has created a heterogeneous industry and let inefficient units survive.

Exit Policy for Fertilizer Units

The retention price scheme (RPS) has a unitwise focus. Emphasis in the scheme is on production and not on the cost of production. Absence of an exit policy let high cost units be part of the sector and put a premium on inefficiency. An appropriate exit policy would have kept check on units with high cost of production and made the sector efficient. High cost of production is due to the following one or more reasons:

- high consumption ratio,
- use of energy inefficient feedstock,
- existence of very old vintage plants, and
- large workforce.

In RPS urea fertiliser units are given normative life period of 15 years. An exit policy in the scheme should have had a mechanism whereby units which are above 15 years and are producing at high costs, have to go out particularly if their production is not significant. A quick study of retention price data shows that the capital related charges in respect of old units are very low as compared to the new units. However because of their old technology and vintage, their variable cost is very high. The old technology has also contributed to the excessive deployment of workforce in these units. Though there is inefficient utilisation of energy, the retention prices of these units are still comparable with the corresponding retention price of a prospective new plant because of lower CRC. The question in this context therefore is of trade off between an old inefficient plant and an efficient new plant. The incremental cost consideration may be an answer in this respect, as continuation of such units leads to avoidable wastage of natural resources. Since a replacement plant of an old plant will normally have gestation period of three years before production can be expected, such old plants should be allowed only for that period leading to eventual exit.

One of the important reasons for introduction of exit policy is to have energy efficient production. The committee concluded that gas based production is the most energy-efficient, followed by units based on naphtha, FO/LSHS and coal in that order. It also stated that, "existing plants based on naphtha and FO should be encouraged to restructure themselves to move over to the cheaper feedstock". The committee also stated that " future production should be appropriately based on domestic natural gas and LNG". Based on this premise it recommended feedstock differential cost reimbursement (FDCR) for naphtha, fuel oil and coal-based units for a period of five years. The reason for introducing this was to bring an exit policy for high cost units based on inefficient feedstock. The committee did recognise the difficulty for units to abruptly switch over to gas or LNG, for the reasons of mobilisation of requisite investments and also due to inadequate availability of gas. Giving FDCR for five years was to accommodate this difficulty. FDCR, therefore, is an enabling arrangement to bring a semblance of homogeneity in a highly heterogeneous sector.

The DOF had restricted the off-take of urea for production at Rs 7,000 per MT and above in 1997-98.[10] This was to discourage high cost of production. Through this measure the government reserved the right to buy urea beyond 115 per cent of the annual installed capacity of the plant. This had two implications. One that it showed that government would have an option to not take any urea beyond a particular level of production. Second, those units which showed a very high level of capacity utilisation were discouraged to resort to gold-plating. A similar arrangement can also be made part of an exit policy, where the off-take is linked with international price of urea.

Joint Venture Participation Abroad

At present India has a self-sufficiency level of 86 per cent. If the consumption of urea at the end of the Ninth Plan is 326 lakh tonnes (without price correction),[11] the present production of 197 lakh tonnes (1998-99 Est) will be able to meet only 61 per cent of the demand. To maintain a reasonable level, say 70 per cent, of self-sufficiency, domestic supply needs to be augmented to 220 lakh tonnes from the present level of 197 lakh tonnes. The balance 30 per cent can be procured from JVs (10 per cent) and imports (20 per cent). The Hanumantha Rao Committee recommended in its report that "imports should not be viewed merely as a residuary element to bridge the gap between requirement and indigenous production". The committee further recommended that, "initiatives to set up joint ventures abroad near sources of abundant availability of feedstock be encouraged as a matter of policy in the coming years, given the shortage of gas in India and growing demand of fertilisers".

Concessional price of gas is no more available to the fertiliser sector. After the implementation of the T L Shankar Committee report, demand-side pricing is being progressively adopted. This is further going to increase the cost of production. The government should therefore encourage Indian companies as a matter of strategy for increase the aggregate supply of fertilisers by setting up joint ventures in those countries where gas is abundantly and cheaply available. Estimates[12] of cash costs (in $ per MT) of production based on natural gas in some countries are as shown in Table 1.

The costs do not include cost of capital services. But interest rates are lower in these countries as compared to the Indian cost of capital.

From Table 1 it is clear that India has best cost advantage in forming JVs in west Asia, Bangladesh and south-east Asia (Indonesia, etc). Three joint venture projects for production of urea in the west Asia are already on the anvil. These projects are the Oman India Fertiliser project in

Table 1

	Cash Cost	Loading	Freight	Total
Ukraine	117	5	32	154
Former SU	124	5	40	169
West Asia	68	5	15	88
Indonesia/ Bangladesh	65	-	-	-

Oman (14.5 lakh tonnes capacity), IFFCO project in Iran (7.26 lakh tonnes capacity) and SPIC's 3.26 lakh tonnes production capacity in Dubai. The choice of west Asia is particularly better because of its vast proven reserves of gas and minimal transportation cost to India. All the three joint ventures have buy-back arrangements. Of the above, the Oman project has just concluded its financial closure and the project is expected to go in production by the beginning of 2001.

As stated above 10 per cent of demand fulfillment through JVs will amount to procuring 32.6 lakh tonnes from JVs. Oman-India project is likely to give 14.5 lakh tonnes of urea by 2001 (assuming the project goes on the anvil now). Further gap can be filled by the SPIC (4 lakh tonnes) and IFFCO-Iran (7.26 lakh tonnes) projects. But their dates of commissioning are not as yet known. Taking these two projects also as committed projects, the gap can be bridged by setting up another plant of 7 lakh tonnes (a normal sized plant) in a suitable place with buy-back arrangement by 2001-02.

If however price correction is effected between the three nutrients N, P and K, then according to the Ninth Plan working group report demand of urea by 2001-02 (at the end of the Plan) will be 245 lakh tonnes This demand with the present production of 197 lakh MTs will leave a supply gap of 45 lakh tonnes only. In case 10 per cent of the demand is to be met through JVs, production from the three projects, Oman-India, SPIC and IFFCO-Iran, will be sufficient.

A relevant question in this regard, however, is that if there are investment opportunities in the gas abundant areas, is it important that supply by JVs should be from those formed by Indian companies only? One can always arrange to buy from any producer through forward contracts. This becomes particularly relevant as the long term buy-back arrangements from Indian JVs are not at any concessional price but at the prevalent international price. Some of the perceived advantages of Indian JVs are:

(a) certainty of supply by creating national involvement,
(b) forex inflow on account of export of equipment, technical services, construction material etc,
(c) reduced risk of wide price fluctuation and flow of profit from the purchase back to the country as dividends on investment.

But risks of political uncertainty and softening of international demand due to increase in aggregate supply through revival or start of idle capacity[13] in the world may make the JVs unviable.

The committee felt that if long-term contracts for higher level of imports were made, it would not lead to hardening of the international price of urea on a long-term basis. An NCAER study done in 1994 also suggested the same.[14] In fact long term supply arrangement reduce wide price fluctuations and do not put pressure on port capacity which otherwise in the event of bunching of supplies leads to mismanagement. Arrangement for procuring assured supply could also be based on forward contracting. Since need for efficient pricing and risk management is felt by both suppliers and consumers, forward contracting would minimise the risks of supply and volatile price fluctuations. Standardisation of contract terms can be a step in helping this arrangement and would also help in averting the risks associated with such trades. So far Indian buying is not based on forward contracting. They are mostly from spot markets. This in a way firms up the international price if large quantities are to be purchased. But if a schedule of supplies required is made known in advance, future contracting will not be difficult. It will also be efficient.

LNG Availability

India is short of natural gas. The Hanumantha Rao Committee recommended that in the light of the current relative pricing of different feedstock and cost of production of urea, future fertiliser production should be based on domestic natural gas and LNG. Existing plants on naphtha and FO should be encouraged to move to cheaper feedstock. But so far LNG is not available in India.[15] Total investment in setting up LNG facility is Rs 6,050 crore. Minimum economic size for LNG imports at present is 2.5 million tonnes per year, which is equivalent to 10 million cubic Mts of gas per day. This volume of gas is sufficient to provide gas for six urea plants (feedstock and fuel) with a total capacity of 4.6 million tonnes of urea.

Capital costs of LNG facility in the exporting country are estimated to be Rs 4,050 crore which includes purification, liquefaction, transport, export terminal and shipping. This will be equivalent to gas price of $ 2.6 per MMBTU. If natural gas is available at $ 1 per MMBTU, the minimum price of LNG on Indian shore will be $ 3.6 per MMBTU. Capital cost of receiving terminal and regassification is Rs 2,000 crore. Since this supports six urea plants, unit capital charge is Rs 750 PMT of urea. Price of LNG is also dependent on price of its substitutes. A rough estimate suggests that if price of naphtha is $ 170 PMT, the equivalent price of LNG will $ 4.2 per MMBTU.

Total investment as stated above for creating an LNG facility is Rs 6,050 crore. Such huge investment is difficult to commit for one particular company given the resource position in the country and also due to the risks associated with the LNG facility. LNG needs committed and assured forward and backward linkages. Any breakdown in the linkages can jeopardise the facility. Given the problems and the fact that LNG for power sector is in the offing in near future, there are two options available: (a) fertiliser plants become partners with power plants in creating the LNG facility; (b) fertiliser plants themselves from a conglomerate for setting up LNG. The second option has the advantage of being a dedicated facility for fertiliser companies. But given the implications for overall national resources, a detailed study needs to be done on this.

Since setting up LNG facility requires a large investment, government should take the lead and consider setting up a fund or giving one-time capital subsidy for LNG facility. One view can be that funds for LNG facility can come out of the savings of not setting up naphtha plants and instead importing the equivalent quantity of urea. This assumes that imports are cheaper than domestic production. (This is so in reality.) Total payout for naphtha based production every year is normally Rs 400 crore (7.26 lakh MT X Rs 5,500 PMT). Cost of importing 7.26 lakh MT at $ 163 PMT is Rs 475 crore ($ 163 per MT is the long-term price of urea adopted by the Planning Commission). So there are savings in a year out of not setting up naphtha-based production.

Since location of LNG plants, coastal or inland, would have cost implication for the gas at factory gate, cost of pipelines become important. The question of who should bear the pipeline cost, assumes importance in considering whether the pipeline will be a public facility or a private facility. It is learnt that the HBJ pipeline has presently 50 per cent unutilised capacity. If that is so, cost of transport of gas will be Rs 200 per thousand cubic Mts as the existing pipelines are depreciated assets. It would be in the interest of overall national resource use that unutilised HBJ line is used for gas transportation for the fertiliser companies. This will also reduce the gestation period for availability of LNG and may facilitate some of the FO-based companies of NFL in Punjab to switch to gas. This will be in keeping with

the Hanumantha Rao Committee recommendations. But cost implications can be the deciding factor in such switches.

Uniform Pricing System

The Hanumantha Rao Committee recommended uniform pricing system based on LRMC principle. But the industry debunked it on the ground that the fertiliser is a heterogeneous industry and so applying uniform pricing system would not be appropriate. But the basic idea behind any pricing principle is that the prices cover capital and current costs of efficient production in a new plant. Marginal cost pricing in this context is a good solution as it achieves the objective of reasonable return, comfortable liquidity and a bearable price for the consumers, besides being welfare maximising. This also achieves economic efficiency because every good or service meets its long-run marginal cost. LRMC-based prices are also sustainable in contestable markets and are incentive compatible as prices are external to regulated firms. A committee,[16] appointed by the BICP in 1988 to evaluate the LRMC concept, had also recommended applying LRMC concept for price calculations for products, which are homogeneous like fertilisers, cement, petroleum, etc. The discussion paper on 'Administered Price Policy' presented to the Parliament in August 1986 had also stated that in the normal context the level of administered prices should be determined on the basis of the long-run marginal cost principle. It can be argued that for jobbing type of work it may be difficult to apply the LRMC concept because product and product specifications vary which lead to different market conditions. This is also so because it is difficult to forecast the demand of jobbing type of work over a long period. This poses the problem of allocation of investment costs, making it difficult to apply the concept of LRMC with reasonable accuracy.

It is against this background that the recommendations of the Hanumantha Rao Committee to replace the cost-plus approach by LRMC-based prices should be examined. The committee worked out the LRMC price for the new units on the basis of the following parameters:

(a) The committee took the capital cost of the new gas and LNG based units at Rs 1,425.21 crore. The capital cost of Naphtha and FO/LSHS based units was taken at Rs 1,473.67 crore and Rs 1,976.00 crore, respectively.

(b) The committee adopted debt-equity ratio of 2:1 for the new projects. Interest on long-term loans was taken 15 per cent and interest on short-term loans and post-tax return at 16.5 per cent and 12 per cent, respectively. Weighted average cost of capital, therefore, worked out to be 18 per cent.

(c) Repayment of long-term loans was taken by the committee to be eight years.

(d) The committee considered production to be based on 330-stream days and capacity utilisation in the first year to be 80 per cent and in the subsequent years at 100 per cent. Based on this, the annual production for the first year was worked out to be 6.15 lakh MTs and 7.689 lakh MTs during the subsequent years. This assessed level of production is 6 per cent higher than the nameplate capacity of 7.26 lakh MTs.

Based on the above parameters the committee recommended the following LRMC price as the producer's price for the new fertiliser units (in Rs per MT):

	CRC	Operating Costs	LRMC
Gas	3968	3015	6983
LNG	4060	4239	8299
Naphtha	4171	5022	9193
FO/LSHS	5482	4845	10327

For the existing units of urea production, the committee recommended LRMC price taking into account two recently set-up grass roots plants and two expansion plants. On the basis of the price suggested by the committee, it found that only 80 per cent of the existing production would be viable. The viability criterion was however comparison with the existing retention price, which may not be really depicting appropriate cost given the distortions in the RPS. Since in this paper the main focus is on the prospective growth scenario of the fertiliser industry, the discussion will be confined mainly to the recommendations of the committee for new units.

The reason for the industry rejecting the recommendation of the committee was its assessment that the parameters adopted by the committee were unrealistic. It was felt that the norms with regard to new units were tight and could not be considered really achievable if they were compared with the present actual ratios. If these are brought to achievable norms, the modified producer prices may be acceptable to the industry. Some of such unrealistic parameters are:

(a) One example of the adoption of tight norms is that the committee adopted 0.549 (in '000SM^3) per MT of urea as the consumption norm for LNG and gas-based production. This is considerably lower than even the consumption norm of TCL, Babrala (0.60669), which is the most energy efficient plant in India with modern energy saving devices.

(b) Another example is that the committee apparently kept the working capital requirement constant. The impact of increase in operating costs on the working capital requirements was not taken into account.

(c) The committee considered LNG as the most preferred feedstock in the long term given the present insufficient availability of gas and bleak prospect of gas availability in future. It did not detail itself to the question of availability of LNG, which was so central to the recommendation of the preferred feedstock. Further it considered the price of LNG at port locations only and did not give pipe transportation cost for the projects in the hinterland.

(d) The committee did not make any provision for dual feedstock, even though the gas is not adequately available for the existing units and the government has of late been encouraging the units to have dual feedstock facility.

(e) It appears that the committee did not include provision for increase in normal repairs and maintenance with aging of the plant or for normal capital additions, which are needed to keep the plant in a robust condition.

(f) The committee ignored the issues of input sales tax, ceiling on selling expenses, need of captive power plants (CPP), etc in the calculations of the LRMC price.

Other major criticisms of the recommended LRMC price for new units were that it would not be able to generate adequate cash for servicing the loans in the initial years of the project. The recommended LRMC resulted in cash deficit in the initial period because of the high capital cost of the project. The committee also ignored the need for higher rate of return for which the industry had long been clamouring, even under the RPS. Given the above inadequacies in the recommendation of the committee, it is imperative to modify the LRMC price to meet some of the valid criticisms while being in the LRMC framework.

Modification of LRMC Price

Some of the alternatives, which can be suggested for modifying the LRMC price are:

(a) Fixing the capacity utilisation at 90 per cent from the 2nd year to the end of the project life.

(b) Changing the consumption norms.

(c) Changing the rate of return on capital to 20 per cent.

(d) Increasing the operating cost as the operating expenses to cover packing expenses, salary and wages,

consumables and stores, repairs and maintenance and selling and distribution expenses seems to be on the lower side.

(e) Readjusting the price so that adequate cash is generated for servicing the loan (interest and repayment) in the initial years of the project.

Capacity utilisation at 90 per cent: The committee had taken capacity utilisation of new units at 80 per cent in the first year and 100 per cent in the subsequent years. The assumed level of production was taken at 7.68 lakh MTs. This assumed level of production is 6 per cent higher than the nameplate capacity of 7.26 lakh MTs. Since the assumed level of production is itself higher and the expected number of stream days is on the normative basis, capacity utilisation of 90 per cent from second year onwards can be proposed. This will give some cushion to those units whose capacity utilisation is more than 90 per cent on the assumed level of production of 7.68 lakh MTs. In absolute terms, any unit producing more than 6.912 lakh tonnes annually gets the benefit. Further since the basis of calculation of the LRMC price itself undergoes a change, the unit gets higher producer's price.

A calculation taking capacity utilisation to be 90 per cent and using the same parameters as adopted by the committee shows the results shown in Table 2.

Changing consumption norms: One of the reasons for low cash generation and therefore the viability of new projects in the recommendations of the committee was adoption of very tight consumption norms. If we adopt the same consumption norm as that of TCL, Babrala, which is the most recent plant with energy saving devices and thus the most energy efficient plant in India, the results are as shown in Table 3.

Changing the rate of return to 20 per cent: The committee had adopted 18 per cent as the weighted average cost of capital. If this is changed to 20 per cent without changing the other parameters, the variation in CRC for the two options – assuming capacity utilisation at 100 per cent from second year onwards and at 90 per cent – as shown in Table 4.

Increasing operating cost: If the operating expenses are changed suitably to cover packing expenses, salary and wages, consumables and stores, repairs and maintenance and selling and distribution expenses, etc, the variation will be as shown in Table 5.

Rearranging the LRMC payoff: In the LRMC price methodology, the unit gets the same price throughout the project life.

TABLE 2

(Rs per MT)

Unit	At 100 Per Cent Capacity Utilisation			At 90 Per Cent Capacity Utilisation			Percentage Variation
	CRC	Operating Costs	LRMC	CRC	Operating Costs	LRMC	
Gas	3968	3015	6983	4322	3017	7339	5.1

Naphtha	5005	5022	10027	6022	5913	11936
FO/LSHS	6579	4845	11424	7844	4999	12843

which may not be enough to meet the cash requirement during the initial years of the project. There is normally larger requirement of cash in the initial years of the project due to high project cost, due to large cash outflow on account of interest on long-term loan and repayment of loan. But this requirement is on a diminishing balance and is over at the end of the long-term loan repayment period, which was taken by the committee to be eight years. Therefore the LRMC price can be rearranged such that the cash flow problem is taken care of during this period. This does not increase the overall cash outgo, as NPV of the project over 15 years is kept constant.

But if we change average capital cost, consumption norms and operating ratios to the level suggested above there will not be any need to rearrange the new LRMC price which will be as shown in Table 6. This new LRMC price will make the cash position positive – in five years' time if 100 per cent capacity utilisation is adopted from second year of operation, and in three years' time in the other case if 90 per cent capacity utilisation from second year of operation is adopted. This cash flow would take care of loan repayment, short-term and long-term, dividends and dividend tax, corporate tax, etc. This will also generate enough surpluses at the end of the project lifetime, i e, 15 years, which will finance expansion or add new capacity.

Apart from the above increase in the LRMC price, there are certain other benefits, which have not been quantified here but are available to the units even otherwise, which should encourage new capacity addition. For example, the committee adopted provision for tax by taking depreciation on straight-line basis, based on 15 years life. But income tax law provides for depreciation on written down value (WDV) basis. This would help in saving tax payment and thereby help in generating additional funds during the initial years. Further, the LRMC price itself would require periodical review depending upon change that may take place in the input prices from time to time. The committee has recommended that no compensation up to 5 per cent increase in input prices need be given and the unit should absorb the increase. But this limit seems to be high and may put the industry in liquidity problems. Thus a suitable limit for review can be considered.

Conclusion

An attempt has been made above to explain and remove some of the deficiencies of the recommendations of the Hanumantha Rao Committee. The above suggestion of modified LRMC price is likely to remove some of the valid criticisms of the report by the industry. But it in no way suggests that the country should maintain the existing high level of self-sufficiency in fertiliser production. The argument that import should not be viewed merely as a residuary element to bridge the gap between demand and supply on year-to-year basis is still valid. The recommendation of the committee that joint ventures with buy-back arrangements should be encouraged to take advantage of the low cost of production in Gulf countries is another means of augmenting supply in an assured manner. But if marginal production is needed to be set up in the country for some reason, the new LRMC price will encourage entrepreneurs to set up new plants which will ensure a guaranteed price for a period of 15 years. This price will ensure operation of the plants on attainable efficiency norms and give positive signals for future growth of the industry. The new capacity should be based on natural gas and in its absence on LNG. But before LNG is available, many steps are needed to tie up funding, backward and forward linkages of procurement and supply, etc.

Notes

1 Between 1982 and 1990, the prices of inputs for fertiliser production increased substantially, but there was no increase in fertiliser prices (see Table A). If one compares the increase in fertiliser prices with those in foodgrain prices, one finds that the growth in foodgrain prices have far exceeded that in fertiliser prices. In a sense therefore, the real cost of fertilisers to farmers has declined over time (see Table B)

Table A: Increase in Prices of Fertiliser Inputs, 1982-90

	Per Cent Increase in Prices
Natural gas	300
Railway freight	200
Power	148
Coal	130
Imported phosphoric acid	74

Table B: Growth in Prices of Foodgrains and Fertilisers

	Price (Rs per quintal) 1980-81	1990-91	Per Cent Increase
Foodgrains			
Paddy	105	230	119.0
Wheat	117	225	92.3
Gram	145	450	210.3
Sugarcane	13	24	84.5
Coarse cereals	105	205	95.3
	Retail Price (Rs per tonne) 1980-81	1990-91	Per Cent Increase
Fertilisers			
Urea	2000	2350	17.5
DAP	3050	3600	18.0
MOP	1100	1300	18.2

2 Kirit Parikh had argued that exceptionally high rates of capacity utilisation in some of the urea units is a clear evidence of gold-plating (*Economic Times*, May 26, 1997) But a report of ING Bearing ('Retention Prices for Fertilisers: Failing to Catalyse New Investment', November 1996) had noted that the capital cost of a urea plant in west Asia is about the same as that of the same capacity plant in India.

3 The Planning commission stated before the Joint Committee on Fertiliser Pricing that, "...The system does not provide enough incentive for continued improvement in technological norms and energy consumption" See Report of the Joint Committee on Fertiliser Pricing, August 1992.

4 The industry feels that the committee did not take a holistic and objective view of the various pluses and minuses. Huge under recoveries due to heavy disallowance in initially fixing investment for pricing, repairs and maintenance and other operating costs made a deep dent into the profitability and even led to losses at normative production levels See 'Comments and Observations Report of the High Powered Fertilisers Pricing Policy Review Committee', *Fertiliser Marketing News*, May 1998

5 'Pricing Policy for Urea Manufacture', a study of pricing system, make-buy options and feedstock and location choices by a group of economists for the Hanumantha Rao Committee, September 1997 (unpublished).

6 Import price of US $ 163 per MT was adopted as the long-term price of urea by the Planning Commission in the Working Group report for the Ninth Five-Year Plan on fertilisers.

On Education Guarantee Scheme in Madhya Pradesh

Rahul

GOPALAKRISHNAN and Sharma (G and S) have made tall claims in favour of the Education Guarantee Scheme (EGS) being run by the government of Madhya Pradesh (GOMP) (*EPW*, September 26, 1998). They assert that this scheme has gone a long way towards universalising primary education in tribal areas at a very low cost without compromising on quality, while at the same time empowering local communities to demand and get education for their children. The reality, however, is considerably more dismal and so the record needs to be set straight so as to ensure that the poor tribals of Madhya Pradesh (MP) are not short-changed by a typically publicity hungry administration.

Even though G and S have harped continuously that the EGS has not compromised on quality, they have not bothered to define exactly what they mean by quality education. Since they have situated themselves in a practical rather than an idealistic context and have spoken of rights and equality, we can assume that quality education would be that which can give the poor, especially tribals, the expertise to compete and get into elite professions like engineering, medicine, computers, management and the like at the end of their schooling. At the primary level this would mean a sound grounding in language and numeracy skills to start with and comfortable proficiency in scientific reasoning techniques by the time they reach class five.

Unfortunately, this is non-existent throughout the thousands of government schools in the state. The reason is that the teachers at the primary level are not competent or committed enough and are also hopelessly outnumbered by the students. An NGO Eklavya has, for the past decade or so, been trying to innovate both with syllabi and teaching methods at the middle school and primary levels to bring about some improvement. Despite some very good work, they have not succeeded much. The main reason is that most of the teachers, after being trained in the new methods, do not follow them once they go back to teaching the children in school. Good teaching is painstaking work and the average teacher is a government servant who does not like to take pains. In fact what he does is conduct private tuitions instead. The net result is that over the years the quality of teaching in government schools has become abysmal. It is not for nothing that costly private schools, to which a considerable number of parents send their children, including G and S, have mushroomed all over MP.

The responsibility for education in tribal areas in MP lies with the tribal department. The teaching of tribal children is more difficult because their mother tongue is not a dialect of Hindi and they reside in remote areas. So the teachers are given an increase in the salary as on incentive. Nevertheless, the level of absenteeism among teachers is horrifying. Not surprisingly, the schools in the tribal areas are in an even worse shape than those run by the education department. The teachers recruited for the EGS are mostly local boys or girls who have been forced to drop out of the malfunctioning formal government school system at the secondary or higher secondary levels because that was as far as they could get by parroting examination guides. To say that such people can provide quality primary education after an induction training of just 12 days at a cost of a paltry Rs 610 and on a monthly salary of a measly Rs 500 is to ask *EPW* readers to willingly suspend their disbelief.

Contrary to what G and S claim, panchayati raj in Madhya Pradesh has not empowered the local people but has formally extended the arm of the state into the villages. The sarpanch has effectively become the representative of the state, both for implementing the numerous pseudo-developmental schemes of the government and also to suppress any genuine protest against its anti-people policies. Local leaders see the posts of sarpanch, janpad adhyaksha and jiladhyaksha as training grounds for becoming legislators and parliamentarians. This is not the place for a detailed criticism of panchayati raj in MP, and so suffice it to say that the panchayats are in reality not free of the bureaucracy as claimed by G and S. So, like many other schemes being implemented by the panchayats, the EGS too has emanated from the chief minister's secretariat. The sarpanches were told to get going and find suitable boys or girls to take on the onerous responsibility of providing quality education to those deprived of it in remote areas of MP. These selected persons then went round a hamlet collecting the names of those children who would attend the schools and thus sprang up the thousands of schools and lakhs of students of the glorified EGS. A far cry indeed from the picture of an enlightened government responding to the conscious demand for education from empowered parents of deprived children that G and S paint.

What is happening in these EGS schools, if they are at all running, is that children are learning the Devanagari alphabet and counting up to hundred. Insofar as previously even this was not happening, the EGS is indeed an improvement. But to infer from this that this is a revolutionary new development that is going to finally solve the vexatious problem of universalising primary education is to grossly exaggerate its potential and underestimate the hurdles that lie ahead. It is one thing to teach children the alphabet and counting at just Rs 8,500 a year per school and quite another to equip them with a solid grounding in language, mathematical and scientific skills for the future. Like the total literacy campaign and the non-formal education scheme, the EGS too has begun to falter after the initial stages. A fact that G and S have not seen fit to disclose in their article.

The EGS in fact is yet another disturbing manifestation of the GOMP's decreasing commitment towards providing true quality education to the people. From 1995-96 onwards all recruitment of school teachers has stopped and instead a Shikshakarmi scheme has been started in which initially teachers were recruited by the block level panchayats at a salary of Rs 600 a month. The recruited people went all the way to the Supreme Court demanding better service conditions. Subsequently, on the direction of the Supreme Court, slightly better salaries have been provided for those recruited recently in the newer version of the scheme. But there is going to be a vast gulf between them and the existing government teachers who will get paid in accordance with the recommendations of the Fifth Pay Commission. By palming off the responsibility of education up to the secondary level to the panchayat system, the GOMP is killing two birds with one stone. It is saving immensely on the cost of education while at the same time gaining kudos for having decentralised its functioning. The EGS has recently been awarded the prestigious Commonwealth prize.

These are expensive times in which even onions are selling at Rs 50 a kilo. Quality education requires a lot of resources in terms of time, money and genuine innovation. There has been a sad lack of these throughout more than five decades of independent governance in India. Now things have taken a more sinister turn with the government not only washing its hands off providing formal quality education to the poor but declaring that ripoffs like the EGS are harbingers of a new educational dawn for the deprived and downtrodden masses in the approaching millennium.

The Sir Ratan Tata Fellowship

The Sir Ratan Tata Foundation at the London School of Economics & Political Science (LSE) invites applications for the third 'Sir Ratan Tata Fellowship'. Applicants should be established scholars in the social science discipline with experience of research on the Indian sub-continent. The Fellowship is not intended for students registered for a degree or diploma.

1. The 'Sir Ratan Tata Fellowship' will be for a period from six to eight months, preferably starting 1st October 1999, and will be based at the Asia Research Centre.
2. The Fellow will receive a monthly subsistence allowance of up to £ 1500 a month, the exact amount depending on qualifications; and will be provided with office space and access to research facilities at the School.
3. The Fellow will be expected to engage in research on a topic under the following themes:
   - Poverty, Inequality, Human Development and Sooial Exclusion
   - Quality of Public Life
   - Regional Disparities
   - Identities
   - Culture and Media
   - The Labouring Classes
   - Economy and Environment
   - The Indian Diaspora
   - Comparative Studies with a South Asian perspective
4. The Fellowship is open to candidates from South Asia, that is, the SAARC region.
5. The Fellow will be expected to finish a piece of research during their stay and make a presentation at a seminar or lecture arranged by the Asia Research Centre.
6. Applications should be addressed to **The Chairman of the Management Committee, The Asia Research Centre, Room M204, London School of Economics & Political Science, Houghton Street, London WC2A 2AE.** (Applications will not be accepted via e-mail or fax.) It should include a curriculum vitae and an outline of proposed research. Applicants should give the names and addresses of two referees, familiar with their work, to be contacted by the Chairman. The final date for receipt of applications is ***15th April 1999.*** Candidates will be informed of the decision by the end of *May 1999.*

Corporation Bank has been ranked the **No.1** Public Sector Bank by the latest surveys of Business Today (Nov 7-21, 1998) and Business Standard (Banking Annual, Nov 1998). As also the inaugural survey by Economic Times (The Agenda, Dec 8, 1998). he fact that not one but three leading business publications have put the bank on top is a testimony to its all-round excellent performance. What's more, Business Today has ranked the bank among the top three PSBs for the last five years, and as the No.1 for the last two years. To reach the top and then stay there, wouldn't you agree that's a rare feat by any standard?

Money, Banking and Finance

Discussion of the real and monetary aspects of short-run structural adjustment using a flow-of-funds methodology and, based on such a framework, specification of an analytical basis for integrating the financial programming model of the IMF with the financial requirements approach of the World Bank in a manner which removes the existing dichotomies between the real and the financial sectors of the economy. **99** Successful inflation targeting requires credibility of the enforcing agencies and credibility in turn requires that the target be chosen carefully. A review of the inflation targeting experience so far and its lessons for India. **115** With the progressive market orientation of the financial system and growing international capital flows, it needs to be considered whether the monetary targeting approach is likely to ensure internal and external stability when the avowed objective of policy is to de-emphasise reserve requirements as an active instrument of policy. **123** Discussion of the potentially stabilising role of monetary policy in two cases: in the first, the monetary authority operating the discount window and in the second, entering as a player with the interest rate on government paper as a strategy. Relative merits of the two policy regimes. **133** While the RBI has sought to correct the distortions in the yield rates on government debt, it has not addressed the question of high interest rates on commercial sector bonds. **74** RBI data bring out the endogenous nature of money supply in India where a paradigm of mixed portfolio loan model is in operation, implying the importance of the policy stances of the monetary authority and private initiatives of banks in money supply determination. **139** An efficiently functioning Treasury bills market sets the tone for transmission of policy signals to decision-making agents in the economy. A preliminary attempt to model the cut-off yield for T-Bills. **145** Narrowly interpreting a sound banking system to mean prevention of bank failures, regulators examine the riskiness of banks' assets and the adequacy of their capital. But do rigid capital adequacy ratios ensure adequate bank capitalisation in reality? **155** The Indian commercial banking sector is characterised by both a high average non-performing share in total bank advances and a high dispersion among banks. An attempt to explain inter-bank variations in NPAs for 1996-97. **161** Transformation of the rural branches of public sector banks may be an alternative to their closure or gradual substitution by private banks. The Indonesian experience may hold useful lessons for India in this context. **169** The focus of strategies to develop the rural credit delivery system has to be on sustainability and viability, operational efficiency, recovery performance, small farmer coverage and balanced sectoral development. **175** Between 1993 and 1996 state intervention had a profound impact on the quality of the Indian equity market. The two central questions in the reforms agenda for the equity market now concern the initiation and expansion of exchange-traded derivatives and a complete transition to rolling settlement. Going beyond the equity market, the principles of market design and the institutional arrangements which have proved successful for the equity market can be fruitfully applied in three other areas: the market for government debt, the currency market and commodity markets. **183** A comparative study of price dynamics in the Bombay Stock Exchange and the National Stock Exchange. **195** In the international financial system, following rapid consolidation and institutional changes, we are witnessing the highly concentrated power of a progressively smaller number of market participants, making the financial system a perennial breeder of systemic risks. **95** The experience of the east Asian countries has underscored the dangers of unregulated capital mobility so long as a country does not have the institutions to handle these flows efficiently. **213** Overview of life insurance operations in India and the emerging strategic issues in the light of liberalisation and the impending private sector entry into insurance. **203** Money, banking and finance: Special Statistics. **218**

Attacks on Christian Community in Dangs

THE eruption of violence in Dangs on December 25, 1998 which has caught the attention of the national and international media is not a spontaneous or sudden development. During the last one year there were 20 instances of attacks on tribal Christians and their prayer halls carried out by the Hindu Jagran Manch (HJM), Vishwa Hindu Parishad (VHP) and Bajrang Dal (BD) combine and backed by the BJP. But the government and the local administration had refused to take any action. These attacks were accompanied by systematic, virulent and malicious propaganda through handbills and series of meetings in and around Dangs. The chief minister of Gujarat as well as the local authorities were informed about these attacks by the local tribal Christian community through a number of memoranda and complaints.

The main propaganda has been that the Christian missionaries and their institutions are resorting to conversion of the gullible and innocent tribals through force and inducements. However not a single case of conversion through inducement or force has been recorded in Dangs to date – a fact which even the government of Gujarat has conceded in its submissions to the National Minorities Commission.

The attacks and malicious propaganda against the tribal Christian community carried out by the HJM, VHP and BD combine before December 25, 1998 had already created a communally surcharged atmosphere in the Dangs. On hearing of the proposed rally on Christmas day by HJM the local tribal Christian community and the Dakshin Gujarat Lok Adhikar Sangh, a civil liberties organisation, formally requested the district collector not to give permission for the rally on Christmas day. These requests went unheeded and the rally and the public meeting were allowed to take place. Anti-Christian slogans and speeches were made by the leaders of HJM, VHP and BD.

The consequences turned out to be as expected. After the rally and the meeting the activists and the members of HJM, VHP and BD combine went on a rampage in Ahwa town damaging shops owned by Christians and Muslims and Christian educational institutions. The police had to resort to lathi-charge and burst tear-gas shells. Subsequently, the members of Christian community and their prayer halls were attacked in remote and far-flung villages of the district by the same activists who had dispersed in different groups after carrying out the attacks in Ahwa town. Between December 25, 1998 and January 11, 1999 a total of 24 attacks on prayer halls, nine physical attacks on individuals and eight attacks on houses and educational institutions have been recorded. All these attacks were carried out during the night and involved groups of 50 to 60 persons and took place in villages where there are few tribal Christian families. In some instances, some government employees were involved and government vehicles were also used.

The constitution of peace committees and the visit of the prime minister does not seem to have had any effect on the activists of the HJM, VHP and BD combine. If anything, the prime minister's call for a national debate on conversions has further emboldened these forces to intensify their anti-Christian activities in Dangs. These forces besides setting fire to two prayer halls immediately after the departure of the prime minister have also begun intimidating the already terrorised tribal Christians to adopt Hinduism. And those who refuse to adopt are threatened with social boycott, burning of their houses and denial of all government benefits due to them as members of scheduled tribes.

The Dakshin Gujarat Lok Adhikar Sangh and the undersigned members are of the view that the attacks on the tribal Christian community of Dangs is part of the broader plan of the Hindu fundamental forces to subdue and suppress the rights of the religious minorities of India. By this they also intend to paralyse the activities of the Christian missionaries who have contributed towards making the tribal communities in south Gujarat conscious of their social, economic and political rights.

Saving the 'Family Jewels'

REDUCING government shareholding in public sector enterprises was supposed to be a way of freeing these enterprises from bureaucratic control and rendering them more viable commercially. The prolonged sound and fury signifying very little over what has come to be known as PSU disinvestment, especially in the last nearly one year of the BJP-led coalition government, has shown how loath politicians and bureaucrats are to accept any dilution of their overlordship of government companies. But then this was not altogether unexpected. What has come as something of a revelation of late is the manner in which government control precisely is sought to be used to steamroller schemes of so-called disinvestment which have nothing to do with improving the business efficiency and performance of public enterprises but have an altogether different objective in view: raising budgetary resources for a severely cash-strapped government.

In just the last few months a series of such schemes have been put on public view. There was the idea of fabricating a 'special purpose vehicle' to which a certain proportion of the government's shareholding in public sector companies was to be transferred. This was followed by the proposal to 'warehouse' the government's shares with public financial institutions. Both schemes were founded on the use of governmental muscle to 'persuade' financial institutions to put up the money to pay for the shares to be transferred from the government. In the event neither scheme got anywhere, ostensibly because the mechanics of the transfer of the government's shares could not be satisfactorily worked out, but as much or more, one suspects, because the politicians in power and bureaucrats were unwilling to countenance even a nominal reduction in government shareholding and they were able to orchestrate shrill cries in political and other circles against the perfidy of disposing of 'family jewels'.

Other artifices were soon devised to yield funds for the budget without touching government ownership of public sector companies. In a remarkable metamorphosis, the proposed legal enactment to permit companies to buy back their own shares, which was supposed to have been mooted in response to the demand of industrialists and business houses and was advertised as a vital measure to revive the stock market, suddenly came to be seen as the answer to the government's prayers. So legislative formalities were short-circuited forthwith and an ordinance was promptly issued to legalise buy-back of shares by companies. It hardly seemed to matter that, quite contrary to the original expectations, not many businessmen queued up to take advantage of the measure which also seemed to have had little impact on the stock market. What did matter was that public sector companies could be told now to buy back their own shares from the government, thereby providing funds to bridge the budgetary gap even as government ownership of them was retained intact.

And now this Wednesday, with just 10 weeks left of the fiscal year and desperate to window-dress the budget due at the end of next month, the cabinet, with the prime minister presiding, once again urgently turned its attention to disinvestment of government shares in PSUs. A list of six companies was drawn up which would be asked to buy shares held by the government – either their own or, as yet another innovation, those of other companies in the list, to create cross-holding of shares, but pumping money into the government's coffers in either case. The plans drawn up for just these six companies will, it has been officially stated, enable the government to achieve and even exceed the target of raising Rs 5,000 crore from disinvestment in this fiscal year. It is evident that a single consideration has dictated the choice of the particular companies: their ability to cough up the cash to pay for the government's shares. Not surprisingly, three of the companies are from the oil sector and two from telecommunications. That these also happen to be sectors of the economy calling for large investments and so draining these PSUs, which because of their dominant position in the respective industries have to provide much of these investments, of funds to the tune of Rs 5,000 crore or more at this juncture has serious adverse consequences for growth does not seem to have bothered the government.

The prolonged muddle over the sale of the government's shares in PSUs is faithfully reflected in the multiplication of agencies and committees entrusted with responsibility for the task. At this week's cabinet meeting yet another cabinet committee was set up to decide on the pricing of the shares of companies chosen for disinvestment. Would this committee replace the existing cabinet body designated as the group of ministers on disinvestment? No, it has been promptly clarified officially, it would not, lest the ministers who have not found a place in the new committee should feel aggrieved. Of course, the so-called core group of secretaries on disinvestment continues to burn midnight oil. The once high-profile Disinvestment Commission too remains a fixture, though its chairman has been largely reduced to dispensing *obiter dicta* on economic policy from diverse public platforms and one of its members the other day disclosed in a press statement how he had stopped attending the commission's meetings since July last. But does all that matter? The 'family jewels' are safe after all.

SCIENCE

Research and Ethics

HISTORICALLY science and ethics have had a difficult relationship. The great experiments in science or medicine that advanced humankind's knowledge of nature and provided ways and means of harnessing its forces for so-called human good were not subjected to the queries which we are increasingly forcing ourselves to ask: Is the particular scientific endeavour relevant? Will the product of the research do more harm than good? Who will benefit? How and on whom has a test of the efficacy of the particular solution been performed? These are not, let us admit, easy questions to answer. For there are genuine fears of the creative impulse which prompts major discoveries or inventions, often read as having been serendipitous, being straitjacketed if one were to posit questions about the relevance of a piece of knowledge or for that matter a product yet to emerge. Not surprisingly then modern societies have waited till disasters take place to set in motion inquiries on ethical issues in the field of science and technology. If the atomic bomb on Hiroshima and Nagasaki prompted debate on the disastrous applications of nuclear science, the Nazi medical experiments on human subjects prompted in time the Nuremberg Code of 1947. This was followed in 1964 by the Declaration at Helsinki. The codification of ethical principles in medical science has seen much development since then necessitated by developments in the field. In the 1980s, with the rapid growth of human genetics research and of reproductive technologies, committees were set up in several countries to codify ethical principles as applicable to the field.

In India, while there has existed since 1980 a policy statement on ethical considerations involved in research on human subjects, it has been followed more in the breach. Since it has been merely a statement, non-compliance with the guidelines has not been punishable in any way. In fact, even the primary recommendations, such as the setting up of ethical committees, have been flouted in the Indian Council of Medical Research's own institutions, if not in letter then in spirit. The setting up of a central ethical committee on human research (CECHR) in 1996 under the ICMR was long overdue and raised expectations of a better ordered ethical environment for the conduct of medical research involving human subjects and, as a fall-out, of all research. Four sub-committees were set up under the CECHR for drawing up detailed guidelines for human genetics research, transplantation research including foetal tissue transplantation; clinical evaluation of drugs; and epidemiological research. In late December 1997 draft reports of the five groups were supposedly released for wide circulation and subsequent national debate for finalisation. And expectedly, while the forms of democratic debate have been adhered to, in reality the drafts have had limited circulation and the public debates, by all accounts, have been in most cases finely tuned and tailored affairs. Even the selection of the members of the sub-committees, it has been pointed out, reflects an antipathy to widening the debate on these issues. For instance, that the members of the sub-committees are all metro-based medical practitioners or health bureaucrats has caused some comment. There is little or no representation of doctors in research or public health or for that matter social scientists or health activists.

While no doubt the drafting committees have drawn upon the relevant codes in different countries, it is unlikely that they have even acknowledged the debates on some of theses issues within the women's and the international health movements. The issue of assisted reproduction has, for instance, generated much debate in the women's movement focused on the woman's health and rights. The ethical guidelines drawn up by the ICMR committee appear to give no special consideration to such issues as women's control over the technology nor do they even seem to be aware of a women's perspective on health issues. For instance, at a meeting to consider the ethical dilemmas in testing microbicides as a new preventive alternative for individuals who do not wish to use condoms, an international meeting posed the issue that in examining the efficacy of the product social considerations also need to be taken into account. Participants argued that "examining questions related to product use (e g, formulation preferences, safety concerns and partner reactions) is absolutely critical to determining the real efficacy of a user-dependent product like a microbicide". Thus was emphasised the need for social science research components to be associated with clinical research. This is an aspect that needs to be given serious consideration at all levels of research using or affecting human subjects.

For too long medical research has viewed human subjects simply as replacing animal models in the laboratory. In effect, human society, notionally, becomes a large laboratory with human beings as subjects for experimentation. Not surprisingly, norms in the higher phases of clinical trials flounder because they encounter individuals who are both agents and subjects of social organisation and unlike animal models expect to have some say and control over the experimentation, even if circumstances may force them to eventually abandon such expectations. This is possibly why the notion of informed consent instinctively raises the hackles of medical researchers and has churned up so much debate over the decades. The act of offering the right over the process of experimentation, in however limited a way, to the 'subject' is outside the scientists' perception of scientific research, conditioned as they have been to the rigid compartmentalisation of science and society. If research has indeed to be of relevance "for the advancement of knowledge and for the benefit of all members of the human species and for the ecological and environmental well-being of the planet", this perspective must change radically. In the absence of such a change, mere statement of general principles as is available in the draft guidelines of the ICMR will be meaningless. The codification of ethical norms in scientific research is the first step towards recognising the primacy of people and their societies over research objectives. As such, the task of the CECHR in formulating the ethical guidelines and of the ICMR in now taking forward the debate and integrating ethical principles in its activities has far-reaching consequences. It would be a pity if the Council fails to broaden and sharpen the scope of the debate such that people are seen not as subjects of research but as participants in the project.

INDONESIA

More of the Same

Jan Breman writes:

PRESIDENT Habibie of Indonesia lacks all credibility as a democratising successor to Suharto's dictatorship. So far no rupture has come about in the intimate relationship with his former boss whom he served for long with utter loyalty and also with much profit for himself. Right from the start it was clear that Suharto had selected Habibie from among his circle of stooges in order to guarantee continuity and to conceal the crimes and fraudulent practices of the New Order regime. Habibie adopted the pose of being a transitional figure and, in reaction to the call for *Reformasi*, pretended to be the inspiring light of the nation's Democratic Awakening. During last year's turmoil, Indonesian students never trusted him and quite rightly so. The debates held in mid-November in the Consultative People's Assembly (MPR) ended without conceding the main demand of the opposition: to dismantle the political power of the armed forces. The sole protest was voiced by members of the only opposition party (PPP) who had to walk out of the assembly in order to get their dissent put on public

record. Street demonstrations were countered with much greater violence. The bosses of the dominating Golkar Party mobilised gangs of mercenaries to assist the military in restoring 'law and order'. In addition to a dozen students, a few of these mercenaries lost their lives. A 20,000 rupiah note was fixed to the body of one who had been beaten to death by an angry mob, to illustrate the underhand payments made by the regime to such squealers. Moreover, the press this time has dared to draw attention to *agents provocateurs* among the demonstrators who incited the throng to loot and burn shops and exhorted the students to storm public buildings. What obscure forces are behind these acts of provocation that are meant to create a state of anarchy? No doubt the same hidden hand that was instrumental in the explosion of violence in the middle of May last year. These machinations are mentioned in a report written by an official team of investigators. Their findings are so sensitive that they have not been able to present their report formally to the authorities. No minister or general could be found willing to accept the official document.

A number of political activists were detained in the slip-stream of the latest turbulence in Jakarta. They drew up a public statement protesting against the undemocratic proceedings in the consultative assembly. Those accused of subversion against the state were all VIPs such as Sukmawati Sukarno (one of the daughters of the first president of the nation) and Ali Sadikin, ex-governor of Jakarta and former marine commander. It was no coincidence that marine detachments stood between military troops who were ready to shoot and the peaceful student demonstrators.

All this signifies a lack of unity among the political elite and even within the army. Habibie has lost whatever legitimacy he had and pressure for him to step down is mounting. Although widely considered a political lightweight, he is nevertheless a shrewd operator who keeps the opposition divided – not such a difficult task in view of the 106 parties that have registered for the parliamentary elections in early June this year – and is willing to use more brutal intimidation if necessary.

Little comment has been made so far about the support given to Habibie by agents of foreign business interests. Indonesia's external debt, already staggering, has further increased in recent months following the new loans extended by World Bank and IMF. Their bailing-out operation might later be seen as throwing good money after bad. Habibie has expressed his gratitude for this new lease of life, claiming rather naively that the billions of dollars handed out are indicative of the restored confidence abroad in Indonesia's economy. This 'aid' has not been utilised, however, to alleviate the growing misery of the ordinary people, but to shore up the rupiah so that foreign investments made in the past would not need to be written off as bad debts. The monetary inflow seems to have helped: the Indonesian currency is now valued at 7,500 rps per US dollar, half the amount that had to be paid when Suharto exited. Capital gradually seems to have become bankable again, while labour remains just as redundant as before.

Early in 1998 the IMF insisted that all subsidies on daily needs such as rice be removed, causing food riots throughout the country. This was the logical but unanticipated outcome of structural adjustment rather than a clever move to engineer the downfall of a tyrannical leader. Having learnt their lesson the major aim of IMF/World Bank is now to back Habibie. Both agencies provide us with 'good news' on the Asian economies. Does this also refer to Indonesia? Most certainly, thanks to 'our man in Jakarta'. Habibie represents a government policy which attaches low priority to combating the immiserisation of the people, avoids registration of massive unemployment for fear of fuelling unrest and introduces the badly needed 'social safety net' only on paper. More than half the population was below the poverty line and that percentage is still increasing. The meltdown which was earlier labelled as *krismon*, the monetary crisis, has now aggravated into *kristal*, total crisis. The social turmoil caused by the economic collapse is expressed along religious and ethnic lines. Such conflicts which have been reported from different parts of the country undermine the foundation of the nation state.

Reactions outside Indonesia to events in that country are contradictory. On the one hand, strong agreement with the harsh dictate imposed by IMF, which was inspired exclusively by monetary considerations, and, on the other hand, mute protests against the brutalities suffered by demonstrators and dissidents. The lack of political stability in Indonesia will endure at least until the elections for a new parliament in four months from now. The only concession that Habibie has made is that he will immediately call a meeting of the Constitutive People's Assembly in order to elect a new president. He considers himself to be the most eligible candidate for the post. Aided and abetted by his foreign patrons, he might indeed come back for a new five-year term in office. He wants to realise his dream of a New Indonesia where, in the next generation, 95 per cent of the people will belong to the middle class, 2 per cent will be super rich, and only 3 per cent will lag behind in poverty. Some dream!

Developments in the financial system have been mixed. While equity issues have dipped low, funds raised by corporates through bond issues, private placements in particular, have increased sharply, with public sector undertakings accounting for the bulk. Banks deposits continue to grow by about 18 per cent annually. Resource mobilisation by UTI and other mutual funds, whose operations are linked to the capital market, has been poor, but NBFCs' deposits have risen from 9 per cent of bank deposits in 1990-91 to 25 per cent in 1996-97. Banks' assets as percentage of total assets of banks and FIs, which had fallen from 74 per cent in 1981 to 63 per cent in 1992, have generally remained unchanged since then.

EXCEL INDUSTRIES

Lower Production

1997-98 was a difficult year for agro-chemical major Excel Industries. The slow down in the economy and the imbalance between demand and supply affected the company's performance drastically. Cheap supplies from China which flooded the market only added to the company's woes. While net sales rose marginally by 2.5 per cent over 1996-97, a steep rise in operating expenses saw the company's operating profit decline by 16.2 per cent over the same period. Disproportionate increases in interest (up 6.4 per cent) and depreciation (up 10.9 per cent) led to a further fall in the company's bottomline, which declined by 33 per cent.

With earnings per share falling from Rs 25.1 to Rs 16.8, the company decided to prune the dividend rate from 75 per cent last year to 60 per cent. Book value, meanwhile, moved up from Rs 122.2 per share to Rs 132.5 per share. The company's equity share trades at around Rs 146 on the bourses, discounting its 1997-98 earnings by 8.7 times.

The company is engaged in the production of pesticides, phosphorous and its compounds, chemicals, organic manure, etc. While pesticides is the largest contributor to its total turnover, bringing in approximately 75 per cent of total earnings, phosphorous and its compounds account for another 21 per cent. During the year under review, production of pesticides declined from 10,131 tonnes last year to 9,379 tonnes, a fall of 7 per cent over the previous year, while that of phosphorous and its compounds too was lower at 13,919 tonnes (1996-97: 14,809 tonnes). The company's performance on the sales front was also not encouraging. While sale of pesticides was marginally higher by 3 per cent, that of phosphorous and its compounds declined by 1 per cent.

The main raw materials required by the company are inorganic and organic chemicals, metal and metal powder, and minerals. During the year, the company managed to reduce, albeit marginally, the import content of raw material consumed from 62.1 per cent last year to 60.2 per cent.

Meanwhile, the company has commissioned a new pesticide fomulation unit at Silvassa in the union territory of Dadra and Nagar Haveli to manufacture glycel 41 per cent SL. It also plans to add facilities to manufacture other formulations in the future.

NOVARTIS INDIA

High Growth

Novartis India, the company formed by the merger of the life science businesses of Hindustan Ciba Geigy and Sandoz India, fared well in 1997-98. While the company's net sales rose by 10 per cent over the previous year, operating profit improved by 36.4 per cent. A fall of 44.3 per cent in interest charges helped the company more than double its bottomline over the same period. Encouraged by its performance, the company raised the dividend rate from 32 per cent last year to 40 per cent. Earnings per share improved from Rs 18.9 to Rs 38.9 and book value moved up from Rs 188.9 per share to Rs 213.6 per share. The company's stock is presently quoted at Rs 889 on the bourses, discounting its 1997-98 earnings by a comfortable 22.9 times

The company is the second largest in the pharmaceutical sector after Glaxo. Novartis AG, Switzerland, one of the world's biggest drug, crop chemicals and biotechnology companies, holds a 51 per cent stake in Novartis India. The parent company's product pipeline and substantial research resources are expected to sustain high growth for the Indian company over the long term.

Novartis India has a balanced portfolio of pharmaceuticals, agrochemicals, nutrition, seeds and eye care products.

The company has introduced five new products for cancer, hypertension, endoctrine therapy, menopausal symptoms and TB treatment. While the general slow down in the pharmaceuticals industry restricted the company's growth in this segment to 11 per cent as compared to 15 per cent last year, its seeds business saw a growth of 20 per cent while its animal health business grew by 25 per cent over the previous year. The company plans to focus on its non-pharma products, namely, crop protection, seeds, animal health and vision care business, in the coming years. It plans to launch a range of biotechnology based products in seeds and crop protection.

Meanwhile, for the first six months of 1998-99, the company continued its high growth. While net sales recorded an increase of 17 per cent over the corresponding period last year, net profit surged ahead by 104 per cent over the same period. Higher sales and synergies of merger coupled with lower interest rates helped the company improve its performance further. The company continues to maintain a leadership position in the therapeutics areas of transplantation, pain, tuberculosis, gynaecology and the nervous system.

NOCIL

Shell's Return

Nocil, an Arvind Mafatlal group flagship, had been in the news -- unfortunately for all the wrong reasons. First there was a fall-out between Nocil and its overseas partner Shell. Then its Rs 4,600 crore expansion project ran into rough weather following cost overruns. Then in 1997-98, the company's performance suffered sharply. While net sales declined by 6.3 per cent over the previous year, operating profit fell by 27.4 per cent. A steep increase in depreciation (up 13.2 per cent) saw the company's net profit tumble by 37.1 per cent during the same period. With earnings per share falling from Rs 4.9 to Rs 3.1, the company cut its dividend rate from 25 per cent in 1996-97 to 10 per cent during the year under review.

Despite being the first company to have set up a naphtha cracker and downstream units in the country, Nocil failed to keep up with the times. Saddled with outdated technology and plants, the company decided to increase its capacities to global levels, but was plagues by funding problems. The company suffered another setback when Shell decided to disassociate itself from Nocil in 1993. What had triggered Shell's decision was the unwillingness of the Mafatlal group to let the foreign partner increase its stake.

What was needed was a thorough restructuring of the company's business on the whole. So the company came up with a plan. It decided to focus on its core competency, petrochemicals. For this purpose it decided to separate its divisions, namely, the petrochemicals, rubber

NA means not available

and plastics divisions, into separate companies. Shareholders of the company will receive 70 shares of Nocil Petrochemicals, 16 shares of Nocil Rubber Chemicals and 14 shares of Nocil Plastics for every 100 shares held in Nocil. The said number of shares is linked to the amount of business contributed to the total turnover of Nocil.

Six years after it had pulled out of Nocil, Shell decided it was time to build bridges again. Along with its fully owned subsidiary, Montell, the Dutch company has reportedly decided to directly invest Rs 1,000 crore in the equity of Nocil Petrochemicals over the next five years. The funds will enable the Indian company to implement its massive expansion programme. Shell will also arrange for the debt portion of about Rs 2,000 crore for funding the latter's huge project. According to reports, the project will entail an investment of up to Rs 7,000 crore at Nocil's plant in Thane in Maharashtra. Shell's high rating in the international debt market will enable borrowings at lower interest rates, it is felt. The expansion project, which envisages increasing capacity from 75,000 tonnes of ethylene to 4.5 lakh tonnes, has been christened 'Lotus' and is scheduled to be completed by 2003. The Shell-Montell combine is acquiring a 49 per cent stake in Nocil Petrochemicals through a preferential allotment after the demerger of Nocil's petrochemicals business. Though Shell is apparently shelling out a little less than three times the amount it realised for its holding six years ago when it walked out of Nocil, this time it is coming in on its own terms. It will have management control, which was the bone of contention earlier.

As for Nocil's rubber chemicals division, it is expected to be acquired by Apollo Tyres. This division has performed better than others in the industry, despite the depressed market conditions which resulted in lower rubber chemicals prices. In fact, the division achieved a breakthrough in exports of UHMW-PE in the European market and exports are slated to do well for the next three years.

Nocil's share price currently rules around Rs 22 on the bourses, discounting its 1996-97 earnings by 7.2 times.

Meanwhile, for the first five months of the current year, 1998-99, Nocil has recorded sales of Rs 442 crore, representing an increase of 9 per cent over the corresponding period last year

Correcting Interest Rate Distortions

While the monetary authorities have sought to correct the distortions in the yield rates on government debt, they have not addressed the question of high interest rates on commercial sector bonds for which the FIs and PSUs have been mainly responsible. The situation calls for policy initiatives by the RBI.

I
High Interest Rate Regime

ONE of the elements hindering the revival of the industrial economy and the capital market has been the prevalence of a high real interest rate regime. In this respect, the cause for distortion has arisen essentially from the government sector: the earlier unusually high coupon rates offered on government securities and the persistence of high yield rates on bonds floated by public financial institutions (FIs) and public sector undertakings (PSUs) ignoring the time-tested principles of interest rate determination based on the implied economic rates of return and the risk and term premia. When public FIs like the IDBI, ICICI and IFCI mobilise funds through fixed-income yielding bonds at high rates of interest, they tend to distort the market in a variety of ways: they drive away private sector floatations of bends, or they keep the rates high for such floatations; they place the equity market at a disadvantage, and make the projects financed by such funds less economic.

Hitherto the fears of debt trap have been voiced only in respect of government finances. Now the latest company finances data show the writing on the wall, with the corporates' debt servicing reaching close to their gross borrowings in 1998-99. RBI data on the performance of the private corporate sector show that interest as percentage of gross profits (after depreciation) has jumped from 27 per cent in 1995-96 to 39 per cent in 1996-97 and further to 42.6 per cent in 1997-98. Their debt servicing levels are estimated to have outstripped gross profits as against less than 50 per cent of gross profits in the early 1990s; in 1998-99, they may touch roughly 120 per cent of such profits.

Interestingly, while the authorities have sought to correct the distortions in yield rates on government debt, they have not addressed the question of high interest rates on commercial sector bonds in which also the culprits are the FIs and PSUs, which enjoy the benefits of low risk premium, and hence ought to restrain themselves in offering high yield rates on their floatations. The earlier policies of offering high coupon rates (14 per cent for 5-year loans) and narrowing of maturities (largely around 5-7 years), which have resulted in a serious debt management problem for the government, have now been corrected. The latest private placement for a 20-year loan with the RBI has been offered at a rate of 12.6 per cent. The centre's loan floatations during the past one year have carried coupon rates ranging from 11.10 per cent (5 years) to 12.60 per cent (20 years). And now the government has reduced the interest rates on postal or small savings by 0.50 to 1 percentage point from January 1, 1999. The revised rates ranging from 5.50 per cent on postal saving accounts and 11.5 per cent on national saving certificates (with substantial tax concessions) may still appear attractive and continue to fetch the large collections as have been taking place in recent years. In the context of the failures of non-banking financial companies (NBFCs), the accruals under small savings have far outstripped the budgetary expectations. Even this year, by November, the collections reportedly have already touched Rs 33,000 crore as against the budget provision of Rs 21,640 crore. Of these collections, 90 per cent are transferred to the state governments at a rate of interest of 14 per cent. Even so, they constitute a part of the centre's gross fiscal deficit. Proponents of fiscal compression and reduction in fiscal deficits ought to note that accruals of small savings and public and state provident funds serve also as a kind of social security in a society with limited social security schemes and that they constitute nearly 50 per cent of the centre's gross fiscal deficit with only the other 50 per cent being financed by market borrowings.

The situation, therefore, calls for an RBI policy initiative to correct the distortions that have surfaced in the working of the financial system. Briefly, the steps desired are:

(i) a reasonable cap, say 12.5 to 13 per cent, on the yields on bonds offered by FIs and PSUs;

(ii) imposition of certain limits on funds that FIs and banks mobilise from the market with substitute support from the primary RBI for FIs and postponement of credit adequacy norms for banks;

(iii) modification of the policy of disinvestment of PSU shares by encouraging the PSUs to float equities directly, mobilise funds through such equities and complementary borrowings, and augment physical investment, which may incidentally give a boost to the capital market; and

(iv) a vigorous focus on the expansion of bank credit as also its distribution amongst different sectors, particularly agriculture, small businesses and small-scale and medium-scale industries.

Size of Debt Stock in the Economy

As a sequel to the data published earlier (*EPW*, December 14, 1996), an attempt is made to present the latest estimates of the size of debt stock – sovereign and commercial – in the economy (Table 1). Aggregate debt stock so estimated has risen from a little over Rs 3,15,000 crore at the end of March 1994 (or near 40 per cent of GDP) to Rs 4,73,000 crore (or 33 per cent of GDP). Sovereign and commercial debt outstandings have grown at a similar pace, which is suggested by the fact that sovereign debt has generally remained at about 70 per cent of total debt. Thus, despite considerable substitution of capital market as well as bank funds by debt sources for corporates, the share of marketable corporate debt in the total debt stock has remained unchanged at about 30 per cent. Also, interestingly both sovereign and commercial debt as proportions of GDP or gross value of industrial output have declined, suggesting amongst other things a moderate growth in funds mobilised by real sectors which in turn imply a moderate growth in financial assets. Roughly the annual average of gross financial savings of the household sector as percentage of GDP for the latest period 1995-96 to 1997-98 at 14 per cent remains the same as it was during 1990-91 to 1992-93. In the final analysis, the high rates of interest, while they do contribute to a sudden growth of the debt market, may themselves hinder the wider use of the debt instruments by many medium-scale or even large-scale industries in not-so-high profit enclaves.

II
Call Money and Forex Markets

For most of December the call rates remained fairly firm – and stable – just above the 8 per cent repo rate (Graph A).

A major influencing factor here was the outgo of about Rs 5,000 crore on account of advance tax payments by corporates that were due on December 15. Ahead of this date banks conserved their resources on fear of liquidity tightening and some large banks withdrew lending in the call market. Also, almost all weeks of the month saw a net outflow of funds from the banking system (Table 2) and thus placed pressure on call rates. The announcement of state government loans for Rs 1,612.15 crore on December 28 added further pressure even at the end of the month when the banks were experiencing a return flow of funds. The ample liquidity witnessed in the earlier months was absent as indicated by the generally low levels of outstandings in RBI repos. The inflows on government security coupons and redemptions were also much less during December. The high

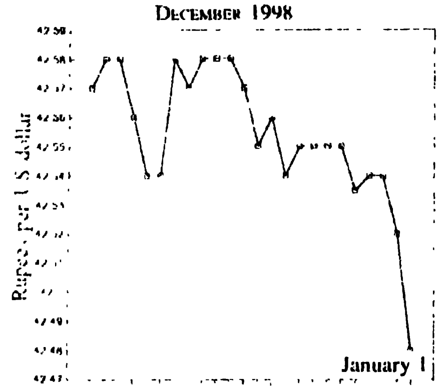
GRAPH B: SPOT QUOTATIONS FOR THE US DOLLAR IN THE DOMESTIC INTER-BANK MARKET – DECEMBER 1998



call also prompted primary dealers to seek refinance from the RBI at a fixed 9 per cent - a phenomenon seen after a long time. And they started repaying these borrowings towards the month-end when call rates fell below 8 per cent ahead of the reporting Friday and the year-end; it ruled in a range of 6.50 to 6.75 per cent on January 1, 1999 (Tables 3 and 4).

The foreign exchange remained stable throughout the month, with the rupee rate trading generally between Rs 42.56/58 to a dollar except on the new year day when it touched Rs 42.46. Overall, the month of December saw a slight appreciation of the rupee (Graph B). Six-month forward rate ruled close to 7.5 per cent. The market has thus remained calm despite reports of widening trade deficit and reduced capital flows. The FII numbers in particular have been more discouraging. On a net basis, FIIs have withdrawn $ 629 million in the first nine months as against an inflow of $ 1.4 billion during the whole of 1997-98.

III
Primary markets

Dated Securities

The third and the last tranche of state government securities was sold on December 28 for an overall amount of Rs 1,612.15 crore; the 10-year bonds were offered a coupon rate of 12.50 per cent. The original amount was Rs 1,719.50 crore but was reduced following the Bihar government's reluctance to accept the allocation of Rs 321.44 crore, it had asked this amount to be reduced to Rs 214 crore.

The stage is set for a further step in economic reforms as the state of Punjab is preparing to launch the first ever auction of state government paper, as against the fixed rate sale until now. It is likely to

come out with a market offer of Rs 60 crore worth of 10-year bonds in mid-January. Market expects that it will be able to mobilise this amount at around 12.25 per cent, compared with 12.50 per cent coupon on the state government loans floated earlier in the month. If successful, this experiment may pave way for other states with well-managed finances to follow suit, reducing the rate of interest on their paper and relieving a part of the burden on their budgetary resources. Other states in line are said to be Andhra Pradesh and Maharashtra which may auction their bonds early next fiscal.

On December 2, the central government privately placed Rs 2,000 crore worth of securities with the RBI. It was a re-issue of 10-year, 12.25 per cent 2008 security. Simultaneously, the RBI auctioned Rs 1,500 crore of 3-year security at 11.47 per cent yield, which was generally lower than the market expectations. With these floatations, the gross borrowing of the central government stood at Rs 80,453 crore (budget: Rs 79,376 crore) and net borrowing of Rs 54,617 crore (budget: Rs 48,326 crore). Even with the balance redemption of Rs 5,215 crore, the net borrowing targets would be exceeded by Rs 1,076 crore. The government has been keeping its resort to ways and means advances from the RBI at a low level (Rs 644 crore being the latest amount).

There have been some slight firming up of the short-term yield rates offered on 14-day (8.35 per cent to 9.13 per cent) and 91-day (9.37 per cent to 9.54 per cent) TBs but a fall in the rates on 364-day TBs (10.51 per cent to 10.47 per cent). Amounts mobilised through these TBs have remained at fairly high levels – Rs 800 crore, Rs 1,400 crore and Rs 1,500 crore, respectively (Tables 5 to 7).

The Bonds Market

The bonds market was quite active during December 1998 with FIs and PSUs keen to mobilise funds. Among the FIs, the more active were the ICICI and the IDBI. The ICICI targeted Rs 600 crore and IDBI Rs 1,500 crore both preferring greenshoe options of amounts equal to the amounts of issue (Rs 300 crore and Rs 750 crore,

respectively). Effective rates of interest offered by the IDBI have touched 14 per cent and those by the ICICI 13.7 per cent. During the current fiscal year, ICICI has so far mobilised Rs 1,770.63 crore including an oversubscription of Rs 470.63 crore against a target of Rs 2,600 crore during the year. IDBI, on the other hand, has collected Rs 1,342.71 crore and hopes to collect Rs 1,500 crore in the latest issue. The IFCI has made an appearance through the private placement route with 5-year and 7-year bonds offering 14 per cent and 14.25 per cent, respectively. Exim Bank entered the market in the last week with a target of Rs 400 crore including a greenshoe option of Rs 200 crore. The coupon offered was 13.50 per cent for a 10-year tenure. IDFC also announced its intention of entering the bond market to raise about Rs 700 crore this fiscal year through private placement. IL&FS privately placed Rs 50 crore of bonds at a coupon of 14.50 per cent for 12 years.

Among the notable private sector bond issuers were Alpic Finance which issued infrastructure bonds at 15 per cent, GE Caps which offered a 2-year bond at 13 per cent and Nirma which privately placed a 13.5 per cent 3-year MIBOR-linked NCD. This is for the first time that the MIBOR-linked debentures are issued for such a longer maturity. Generally such issues are for a maximum period of 18 months. Earlier such issues from GE Capital Services and Reliance Industries were of one-year maturity. Another innovative structuring of coupon rate was reflected from the 13 per cent 364-day NCD from TELCO to raise Rs 75 crore (including Rs 25 crore greenshoe option). The rate was at a narrow spread of 180 basis points over government securities for the same tenor. The issue was closed successfully within two days after it received commitment for Rs 127 crore. The success is attributable to the fact that with FIs currently offering 12.75 per cent for 13 months with a 20 per cent risk weight, TELCO's issue at 13 per cent for 364 days with 100 per cent risk weight was among the most tightly-priced issue in recent times. The 16 per cent 7-year NCD from Haldia Petrochemicals was also in the market continuing from the previous month. Among the NBFCs, Infrastructure Lease and Finance Services (IL&FS) hit the private placement market with two options of 12-year bonds to raise Rs 50 crore. On the first option, it offers 14.5 per cent. On the other, which is floating rate bond and is specifically targeted at PF, the coupon rate would be 2.5 per cent above the PF rate decided by the government. Currently, PFs offer 12 per cent interest, so the rate for this paper would be 14.5 per cent. However, a floor rate of 13 per cent and a cap of 16 per cent has been set for this option.

The lack of demand for funds by corporates has led to a curious development where the differential on debt yields as between those of corporates and FIs has narrowed to about 25 basis points as compared with 75/100 basis points a year ago. The scarcity of good corporate paper has created a latent demand for such papers in banks, which are willing to mop up high-rated corporate paper at 14.25-14.50 per cent for five-year maturity. This

( ) means no trading YTM = Yield to maturity in per centage per annum CY = Current yield in per cent per annum * Yield rates of these sub groups of bills and dated securities have been used for the graphs

Securities with small size transactions and inflation linked bonds have been dropped from the above list but included in the respective totals

Notes 1) Yields are weighted yields weighted by the amounts of each transaction

2) Current yield has not been worked out for treasury bills

compares with 14 per cent of IDBI and ICICI and 14.25 per cent for IFCI.

Other Instruments

As per the data released by the RBI, commercial paper issues totalled Rs 902 crore and Rs 786 crore during the fortnight ending December 15 and December 31, respectively, which were somewhat lower than those in the recent past. The rate of interest ranged from 9.45 per cent to 13 50 per cent were also somewhat lower than in the early part of the year.

The data on certificates of deposit (CDs) were only till October 23, 1998. As on that date, total outstanding amount of CDs issued by commercial banks was Rs 6,214 crore, of which CDs totalling Rs 639 crore were issued during the latest fortnight and they were the lowest for some recent fortnights. The rate of interest ranged from 8.25 per cent to 13 per cent, showing a declining trend.

IV
Secondary Market

Dated Securities

With the banks' attention fixed on the movements in the call money market, prices and yields on government paper largely remained unchanged. Transactions were concentrated in 11.40 per cent 2000, 11.55 per cent 2001 and 11.78 per cent 2003 papers. The yield curve showed a normal gently upward sloping behaviour (Graphs D and E). Though the secondary market transactions in dated securities during December (Rs 8,348 crore) were slightly larger than those in November (Rs 7,908 crore), such dealings in 91-day and 364-day TBs were considerably less in December (Rs 2,500 crore as against Rs 5,565 crore and Rs 539 crore against Rs 2,331 crore, respectively)

Though the RBI has been adopting an aggregative open market operations policy so as to offload securities obtained due to support to market borrowings by the government, the size of OMOs during December (at Rs 598 crore) was very moderate compared with November (Rs 3,934 crore) (Appendix Table). Up to November, the OMOs have aggregated about Rs 18,000 crore. Outstandings under RBI's repo window remained low (Table 8). Repo transactions outside RBI were at a normal pace

Gilt Fund

The launch of first-ever gilt related mutual fund was reported to have received good response from the market The Kotak Mahindra Asset Management Company's K-Gilt received Rs 80 crore of funds which will be invested in gilts. A successful performance by K-Gilt could lead to a widening of retail market in gilts which is one of the stated objectives of the RBI. On the day the fund closed for public subscription the sponsoring company was seen to have picked up the zero coupon 1999 security on a large scale. While one can understand the tendency of the fund to look at short tenure paper, this may not serve the purpose of the authorities to widen the market by inspiring players to look at papers of different maturities across the spectrum.

Commercial Bonds

The tempo of trading in PSU bonds remained high during December but that in other commercial papers was sluggish (Table 9). Amongst PSU bonds, tax-free bonds have attracted sizeable trading at Rs 211 crore as compared with taxable bonds at Rs 44 crore.

[V P Prasanth, Rafiq L Ansari and Nandini Sengupta have undertaken the statistical compilations for this note]

Attacks on Minorities and a National Debate on Conversions

Walter Fernandes

There is a pattern in the recent attacks on minorities and the use of religion in a political and economic power struggle. But the situations are different. In Gujarat it is an attack on tribal efforts to protect their identity or free themselves from poverty. In Karnataka it is competition between powerful groups. And in Orissa it is division among the subalterns exploited by vested interests. Conversion functions as a convenient tool to divert attention.

THE beginning of 1999 has been marked by a double legitimation of the attacks on the minorities, particularly Christians in Gujarat and elsewhere. In late December Ashok Singhal of VHP complained that the Nobel Prize to Amartya Sen is a Christian conspiracy meant to open more 'missionary' schools and convert the poor through them. "These Nobel Prizes were only intended to give sanction to Christianity to spread its base in the country" (*The Indian Express*, December 27, 1998). The second is the reported statement of Prime Minister Vajpayee that there should be a national debate on conversions. These statements come in the wake of attacks on Christian institutions in Gujarat and communal tension in Karnataka and elsewhere. Both divert attention from the issue of poverty as a vested interest.

One sees a pattern in these attacks and in the use of religion in a political and economic power struggle. But the situations are different. In Gujarat it is attack on the tribal efforts to protect their identity or free themselves from poverty, in Karnataka it is competition between powerful groups and in Orissa, it is division among the subalterns exploited by the vested interests. Conversion functions as a convenient tool to divert attention.

Conversions Today

One knew that these attacks were guided by vested interests. But for the first time those providing it ideological or other support came out openly to state their position. However, those using the bogey of conversions do not seem to know that the number of Christians has been declining. The 1991 Census shows that they are 2.5 per cent of the total population against 2.6 per cent in 1981. Had there been massive conversions, it would be difficult to explain this decline. High literacy among Christian women and greater urbanisation seem to explain it. To limit oneself to the rural areas, in 1991 female literacy was 56.9 per cent among Christians, 25 per cent among Hindus and 23.9 per cent among Muslims.

On the other hand, one cannot deny that there are some conversions, mainly but not exclusively in the north-east, where more often than not they take the form of 'sheep stealing' from one Christian denomination to another. Elsewhere in India, aggressive religious propaganda is made mainly by Born Again Christian fundamentalist groups that claim to have founded several lakh churches. According to a news item (*The Indian Express*, January 4, 1999), a book recently published in London states that 6,00,000 churches should be founded in India, one in every village, in order to make Christ present in the country. A closer scrutiny reveals that what they call churches are in reality families in which they hold prayer meetings. Most of these families do not even join them later. They claim to have six million adherents in the country. A realistic estimate seems to be around two millions, most of them got through 'sheep stealing'. So the numbers themselves are not big. But the exaggerated claims can provide fodder to those who want to exploit the issue.

Studies indicate that many such fundamentalist groups were founded in the 1970s and funded by the American Eastern Establishment as a counterweight to the anti-Vietnam turmoil. In that sense they are Christian counterparts of other 'charismatic' movements like Hare Krishna and Zen that became popular in the west as well as in the Indian middle class [D'Epinay 1983:44-47]. They diverted attention from the social issues by satisfying individual psychological and emotional needs. The warmth and companionship they provide seem to compensate for the absence of an emotional component in most established religions whose rituals tend to be dry and formal. Besides, they provided security to the younger generation that was growing up in an atmosphere of uncertainty and unemployment. Focusing on meditation and the other world prevented them from turning their insecurity into protest [O'Donnell 1983]. That may explain why most adherents of these fundamentalist groups come from the urban middle class.

Conversion as Protest

On the other hand one cannot minimise the role of conversions as protest by the subalterns. Studies on the late 19th and early 20th century conversions in India show that they were primarily among the dalits and tribals. The missionary who needed numbers approached these classes after he failed to get dominant caste adherents [Grafe 1990:82-83]. The subalterns were open to receive his message if he responded to their aspirations in the context of the destabilisation caused by colonialism. On one side the Bhakti movement that could have provided the 'untouchables' with the social space they required in their search for equality had ended but its spirit was still alive among them. On the other, the colonialist co-opted the dominant classes into the administration. Colonialism does not involve the foreigner ruling the local masses directly but through locally dominant classes. To administer India, the British needed collaborators from these castes and classes [Misra 1961:49-51]. In the context of the end of Bhakti movement, providing them with opportunities of English education and administrative posts was equivalent to choosing the dominants over the subalterns. It strengthened them further.

Besides, in order to take control of land for colonial purposes, the British also introduced new land laws based on the eminent domain and individual ownership. These changes weakened the jajmani system in regions where their presence was the strongest. Jajmani had provided material security to the agricultural labourers and other subalterns, mostly from among the 'untouchables' but had left them with a very low social status. The weakening of jajmani deprived them of material security without in any way adding to their social status [Fernandes 1996:152-54].

These changes also freed the dalits from the system that had till then deprived

them of the possibility of upward mobility. Now they were free to seek liberation elsewhere if such an agency could be found. Most of them did not. So they ended up as bonded labourers or as indentured labour transported in slave-like conditions to plantations in India and other British colonies [Sen 1979:8-12]. A few like the mahars found upward mobility by joining the British army or by commercialising their traditional products [Cohen 1969].

Religious change functioned as one such mode of upward mobility. To the converts it was not merely a religious event but also a search for equality, as such a political act. So in the late 19th and early 20th centuries dalits in many parts of India made the option of turning their caste movements into conversion movements [Aggins and Lochan 1989:142-43]. There were mass conversions to all denominations that they perceived as preaching equality. They joined religions like Islam, Christianity and Sikhism that gave them the hope of liberation from their oppressive state. For example, dalits on the Pakistani side of Punjab joined Islam and those on the Indian side joined Sikhism at the turn of this century and not in the Mughal age [Sharma 1976:219].

One finds an analogous process among the tribals. In Jharkhand, for example, the Permanent Settlement 1793 turned the traditional tikhedars (till then tax collectors) into zamindars. Tribal land, the very centre of their identity, began to be alienated to the zamindars. At that stage, the Belgian Jesuit Constans Lievens who studied their land laws and helped them to save their land came to be viewed as their saviour. Mass conversions followed [de Sa 1975]. In the north-east, Christianisation of the tribals was a reaction to the efforts to sanskritise them. They viewed Christianity as an alternative to sanskritisation sustained by the dominant classes [Downs 1983:3]. Studies [e g, Oddie 1978:30-36] also indicate that the missionary did not always understand their aspirations. Mass conversions were got more by those from northern Europe who had to some extent internalised the egalitarian ideology of the 18th and 19th century political revolutions than by those from southern Europe that had experienced neither the Reformation nor the political revolutions. The former viewed caste as the very antithesis of equality and rejected it though later they came to a compromise.

The Dominants and Subalterns

In most cases dalits did not succeed in attaining equality, particularly in states like Tamil Nadu and Andhra Pradesh where the 18th century sudra converts had moved upward and filled the vacant spaces in the caste hierarchy within the institution [Hudson 1993]. That notwithstanding, this process continues to our days though in a limited form. According to a news item, 10,000 dalits in UP are threatening to join Islam if their grievances are not remedied (*The Times of India*, December 22, 1998). Also the Meenakshipuram conversions of 1981 fall in this category. Those who embraced Islam were dalits with good education and government jobs through SC reservations. But the dominant castes continued to treat them as 'untouchables'. Dalits viewed religious change as a way out of the impasse. Discussion started on whether they should become Muslims or Christians. At that stage, three Christian families among them are reported to have said that their ancestors had embraced Christianity in search of equality but they had not attained it. So they were becoming Muslims. That cast the lot in favour of Islam [Augustine 1981].

Whether the subalterns attained their objective or not, the dominants like the mirasdars in Tamil Nadu and zamindars in the north perceived the conversion of their bonded and other labourers as a threat to their power. They accused the missionaries of fermenting disorder, forgetting that "the conversion was caused by agrarian unrest, but it was not at the bottom of the conflict as the landlords liked to maintain, thus turning the issue upside down" [Schverin 1978:52]. The situation remains unchanged.

In most cases the missionary also attended to the material needs of the converts particularly their education. As a result, that literacy is the highest in tribal regions where the church is active is obvious from census figures. Also my experience substantiates it. I have been on the recruitment boards of some autonomous institutions. During the last few years I have interviewed about 1,000 SC/ST candidates for their reserved seats. Apart from the meenas of Rajasthan who are a somewhat prosperous group, the remaining tribal candidates having a post-graduate degree in the social sciences came from only two regions, Jharkhand and the north-east, both of them having a large number of church-run educational institutions. I am yet to interview a tribal candidate from other regions. Dalit applicants come from the four southern states, the mahars of Maharashtra and the wankars of Gujarat. There was none from the Hindi belt. Christians are a minuscule minority there and inadequate effort has been made to educate them. Besides, Christians are denied SC privileges, as such cannot apply for these jobs even when they are educated.

Studies also indicate that literacy among dalits is relatively high in regions like Tamil Nadu that have witnessed a process of political or religious conversion movements. In Tamil Nadu dalit Hindus have been able to take advantage of the reservations. Since Christians are denied these privileges, the educational status of dalit Hindus is better than that of Christians [Kananaikil 1990]. In most other regions dalits are denied access to education. For example, studies in eastern UP show that the dominant castes make it a point to send their own children to school. But they ensure that no school is built in the village, lest their labourers gain access to it and then either leave the village or demand better wages and working conditions [Jetley 1977:56].

Little wonder then that literacy becomes a threat to people with a vested interest in poverty. So those running schools for them are accused of forced conversions or fermenting disorder. In fact, Christians run institutions both for the rich and the poor. Of the 108 cases of attacks on Christian institutions reported in 1998, one is not aware of any on schools meant for the rich, many of them frequented by the children of the powerful. Conversions also become a mode of diverting attention from such a vested interest. Little wonder then that Prime Minister Vajpayee wants a national debate on conversions but not on growing poverty and illiteracy. He and other BJP leaders have only dissociated themselves from the attacks but have not condemned them.

Besides, the recent events have to be seen as a continuum from the past and as an important step towards fascism. No fanaticism can succeed without a new demon at every stage. One can find a parallel with Iraq. To ensure its ongoing control over the oil resources, the US at first demonised Iran then Libya and now has to keep demonising Saddam Hussein. Similarly the fascist forces in India found a demon in the Sikhs in the 1980s, Muslims in the early 1990s and are now turning their attention to Christians. Myths are created and propagated for this purpose. In 1984 rumours were spread that Sikhs celebrated the assassination of Indira Gandhi [Kothari 1985]. In 1992 it was the myth of a mosque built over a temple. Now it is forced conversions [Sanghvi 1999]. This process should also be seen as integral to the electoral battle and the effort of the Sangh parivar to ensure that the RSS ideology is not sacrificed by the BJP-led government, for its short-term needs [Vyas 1999].

A 'dialogue' of sorts may be held with the newly found enemy, as the RSS leaders did with representatives of Christians, on December 18, 1998. The effort of the RSS at this 'dialogue' was only to try to convince the Christian side that they were in fact indulging in forced conversions. Not discussion was held on this issue. Such dialogues only have a propaganda value. But it is clear that the events of the last few months have been well planned. Otherwise one cannot explain 108 attacks on Christian institutions in one year, 58 of them in Gujarat [Das 1999].

Most such attacks have been on institutions meant for the poor. The exception is Karnataka where some Church run schools were told to install an image of Saraswati before the end of November 1998 and begin the day with 'Saraswati vandana'. Otherwise they would have to pay the price. In districts like Dakshina Kannada (with Mangalore as its headquarters) competition has traditionally been between three dominant groups, Catholics who have held administrative and executive jobs, the Konkanas (goud saraswat brahmins) controlling trade and commerce and the land owning bunts. In recent decades, new groups from the fishing, toddy tapping and Muslim communities have come up as a result of jobs in the Gulf, smuggling and trade. Tension has thus arisen for control over land, trade and other benefits. Party vote banks have been built around these communities and the BJP has gained strength.

In R Udayagiri in Orissa it is division among the subalterns. For many decades moneylenders have used the dalits (Pano) as their agents to exploit the tribals in the village. As a result, there has been traditional rivalry between the two. A majority of Christians in Phulbani and Gajapati districts are panos. The vested interests and political parties have communalised and exploited this division. Several churches were destroyed in Phulbani in 1992 in what was in fact a land struggle. In 1998, the Sangh parivar allegedly used this rivalry to get the tribals to attack the panos [Sethi 1998].

Challenge for the Future

Where does one go from here? The first step is to recognise the problem as political, not religious. The second is to identify one's friends and allies. One notices a major change in the latter. As late as 1997 cases like the parading naked of Fr Christudass at Dumka and the murder of Fr A T Thomas were ignored by most human rights activists outside Bihar. They were seen as of concern to Christians alone. The major change in 1998 is the active participation of a large number of secular-minded human rights activists in protests against the attacks. They viewed it as of concern to every Indian.

The second major change is in the role of the Left. Even before Gujarat reached the front page, other events had created an atmosphere for the type of propaganda one witnessed there. For example, the BJP government of Delhi declared that since during the communion service about half an ounce of wine is used to commemorate the Last Supper of Jesus, churches are not religious houses but places of entertainment. As such they should be taxed as commercial centres. Before Christian leaders could get their act together, the Left made a political issue of it and got the government to withdraw the order. After the rape case in Jhabua and after the Gujarat events too, the Left was prominent in extending its support. After the Nashik ultimatum to 'missionaries' the Left took an active part in the demonstration held in Mumbai.

That is a major change from the 1981 CPM politburo resolution that cautioned its cadres against interacting with Christian activists for fear that it may be a reactionary ploy. Two years later the RSS journal *Manthan* published an article stating that Liberation Theology is one more tool Christians have found, to attract the poor and baptise them [Agarwal 1983]. Its position has remained unchanged since then. But there has been a better understanding between progressive Christians and the Left. The two have worked together on some issues without necessarily agreeing on every point. Besides, the new thinking generated by the Second Vatican Council of Catholics and the 1972 Nairobi meeting of the World Council of Churches played an important role in the understanding of evangelisation as liberation from poverty and exploitation. The Liberation Theology that grew among the subalterns of Latin America and the Philippines made an impact also on other continents of the south. In this approach, the Gospel is viewed as the proclamation of Jesus the liberator. An unjust society is sinful. Evangelisation would then be liberation of the oppressed from this social sin, unlike in the past when focus was on individual sin. Evangelisation is thus understood as proclaiming the liberative message of Jesus. Baptism is not its ultimate objective [Alfaro 1986].

These changes provide the first building block of a new secular alliance. The third block has to be the coming together of the minorities. In building it, Christians have to acknowledge that they have not taken an active enough part in communal matters. Till about 1980 most of them viewed communal riots as of concern to Muslims and Hindus alone. Many did bring relief to the victims but did not show adequate solidarity. Like the relations with the Left, the 1980s saw changes in the attitude of many Christians towards the minorities. The ongoing involvement of several of them in social action and advocacy with the oppressed and activists of different persuasions has had a salutary effect on both sides. Among other changes one may mention that after the 1984 massacre of Sikhs in Delhi, Christian leaders brought their adherents together for a reflection on the events. After the demolition of Babri masjid, the Church apex bodies were among the first to issue statements of concern and solidarity with Muslims.

Thus much has happened since the 1980s. But many more steps need to be taken for all the minorities to form an alliance with the secular and democratic forces. There is a danger of these moves being limited to a few social and human rights activists and a section of the leadership. Efforts have to be made to reach the masses. It is because fascism can be stopped only through a strong alliance. It cannot be done through a national debate on the pretext the criminals use to legitimise their action. The guilty should be punished. Simultaneously a broad based secular alternative has to be found. That is the challenge of the progressive forces.

What Is Bt and What Is Terminator?

Suman Sahai

Trials of a genetically altered cotton variety (Bt cotton) conducted by the American company Mosanto which also happens to own the terminator technology have provided the trigger linking the two because of coincidence and confusion. The two are not related except for the fact that they are both genetic creations.

STRANGE terminologies like Bt and terminator are in the air and with it there is rampant confusion. Bt stands for bacillus thurengensis which as the name suggests, is a kind of bacteria, much like the bacillus that causes leprosy or tuberculosis. The terminator technology is the monstrous new genetic tool by which you can design seeds with in built sterility. The two are not related except for the fact that they are both genetic creations. Both happen to be in the news together and are linked together because of coincidence and confusion. Trials of a genetically altered cotton variety (Bt cotton) conducted by the American company Monsanto have provided the trigger because Monsanto also happens to own the terminator technology. What then exactly are these things?

The Bt technology which was developed about 10 years ago is designed to confer disease resistance to certain crops against pest attacks. The essentially simple technology has involved cutting out a gene from the bug called bacillus thuringensis and using the tools of recombinant DNA to transfer this gene not into another bacillus but across the species barrier into a plant, in this case a cotton variety. This transcending of the species barrier, makes the gene very foreign to the cotton genome and therefore this cotton becomes a transgenic variety. The reason why this approach is being tried in plant types, and not just cotton, is because it provides an opportunity to build a biological pesticide into the plant itself.

Cotton pests, specially bollworm are a major problem, as the spate of recent cotton farmer suicides have shown in the most tragic way. Much of the chemical pesticide on the market is adulterated or spurious and therefore not effective. The in-built pesticide approach is very attractive for two reasons. One, the farmer is not sold short by unscrupulous pesticide dealers and two, the environment is spared the toxic burden of chemical sprays leaching into the soil, air and water and poisoning them. However, as always in something that sounds so good, there could be catches which we must watch out for. But first how does the Bt resistance work?

The Bt gene once ensconced in the cotton genome proceeds to do exactly what it did in the bacterial genome, namely, produce a toxin as a by-product of its metabolism. Small concentrations of this toxin course through the sap of the cotton variety. When the dreaded bollworm, the most pernicious pest of cotton alights on the plant and proceeds to drink the sap, it is supposed to get a dose of the toxin and drop dead. That is the rationale and the design of the experiments on Bt disease resistance. That is what Monsanto has created: a cotton variety called Bollgard, which because it is carrying the Bt gene is supposed to provide resistance to bollworm. What if any are the pitfalls in such an approach?

The first question mark on the Bt mode of pest resistance is that the gene construct which was effective in providing resistance appears to be breaking down. This means that it is not producing the toxin in the cotton plant as it was originally intended to do and therefore not conferring resistance to bollworm. The second way in which the Bt resistance is failing is by creating bollworm strains that are becoming resistant to the Bt toxin and not being affected by it.

The other danger that is posed by the Bt cotton and all other transgenic varieties, is the danger of the foreign gene escaping from the original transgenic plants where they were put and moving into related plant species. This is possible via cross pollination. The pollen cells of the transgenic plant contain the foreign gene like every cell of the transgenic plant does. During pollination, pollen carrying the foreign gene can fertilise other plants that are not transgenic. So, if my neighbour has chosen to grow a transgenic variety and I have not, I cannot protect my crop from pollution with the foreign gene because there is no way of controlling pollination.

The other thing that can happen is that the pollen can fertilise and therefore transfer the foreign gene into related and wild species. Since the transgenic technology is so new, we do not know what effects foreign genes like bacterial genes can have if they start moving from species. Once they are out in the field, we cannot control them. There is serious apprehension on this score. Scientific studies have shown that pollen can be transferred across very large distances and can transfer the foreign gene into plants growing far away. The dangers of gene pollution of this kind are therefore very real and that is the reason why testing for transgenics in the field has to be conducted under strictly controlled conditions which are specified in biosafety protocols designed for these varieties. The biosafety regime includes safeguards like physical containment, covering the field with plastic sheets during pollination and land tracts isolating the experimental plots from farmers' fields. In addition to this, data needs to be collected from the field constantly to see whether the foreign gene has escaped from the experimental plots to neighbouring fields.

To return to Monsanto and its transgenic tests, the company should be penalised for its cotton trials not because the variety contains the terminator gone but because the company has flouted all biosafety regulations. This could mean much more than endangering farmers' crops in nearby fields, such negligence could carry the foreign gene, goodness knows where and with what consequences. This is a very grave offence. It may not be far fetched to accuse Monsanto of being callously negligent in their field trials because they think they can get away with cutting corners and doing shoddy tests in India which they would not dare to do in their home country, the US.

In India awareness about the new developments in genetics and agriculture is very poor, specially in rural areas. Never mind the farmers, what is shocking is the utter ignorance of the scientists and scientific institutions working on the new areas in genetics and biotechnology. It may be recalled that just a few months ago, the experimental plots with standing crops of a transgenic variety had destroyed in the field in Delhi since safety regulations were not being complied with. This was incidentally at a reputed national facility. Apart from biosafety requirements, transgenics cannot be tested in the field without the informed consent of the region's farmers. Monsanto has been conducting its tests without taking local farmers into confidence or informing them. This is an obnoxious attitude apart from being a dangerous one. Monsanto's licence to test Bollgard cotton should be cancelled for these reasons.

Terminater Seed

Now to come to the terminator. This technology is also based on a genetic construct. Here two gene systems have been brought into play to produced seeds with an in-built mechanism that aborts development of the embryo so that germination cannot take place and the seed is rendered sterile. The self-destructing seeds are actually hybrids produced by hybridising two transgenics, each containing one of the two gene systems. It is interesting that even when the two gene systems are brought together in the hybrid seed they are viable and can germinate. In order to control the induction of sterility, a chemical switch has been built in. This switch can be activated by soaking the seeds in tetracycline. Once the tetracycline soaks into the seed tissue, it switches on one of the gene systems which sets in motion the chemical process which will abort the embryo. So in practice, the seed company can produce as much of the seed as they want and just before selling it to the farmer, they can treat the seeds with tetracycline to switch on the sterility inducing gene system.

When the farmer buys this seed from the company, he can grow one crop from it but the seed that sets in his crop when it matures, will not have the ability to germinate. The farmer will thus not be able to save viable seed from his crop for the next sowing and will be forced to return to the seed company for new seed. This establishes total control of the seed company on production and sale of seed. The terminator technology is miles ahead of the patent system in establishing the monopoly of the multinational seed companies on the seed markets of the developing world. The avowed goal of multinational companies is to capture the vast potential of the seed business in India and China and the countries of south and south-east Asia, all burgeoning agricultural countries with growing seed markets.

At present the terminator gene system is being tried out in cash crops like cotton and tobacco. In this context it is alarming that Monsanto with its big take in cotton varieties has bought the Delta and Pineland company, co-owners along with the US government of the terminator technology. This means that Monsanto now owns the terminator gene systems and if it does not have a terminator cotton today, it almost certainly will have one tomorrow. This must be anticipated and Indian agriculture policy must take the requisite legal steps to ensure that Monsanto cannot bring terminator cotton into India either for testing or for commercial use.

Cotton and tobacco however are only the first focus of the terminator system. In principle this sterility inducing mechanism can be incorporated into any kind of crop. The next round of crops that are to be tried out are essential food crops like rice, wheat, pulses and millets. If the terminator technology should be successfully transferred into these crops (and there appears to be no reason why it cannot), the implications for global sustenance and food security could be quite horrific. Rice and wheat are the staple food of three quarters of the world's population. With pulses under the terminator hammer, all aspirations of adding nutritional security to rudimentary food security, would fly out of the window. For, those who argue that no one is compelled to buy seeds from MNCs and those who wish to, can continue to get their seed from wherever they are getting them today, do not understand the fundamentals of plant breeding, seed production and the practice of agriculture.

With the new breed of controlling instruments like patents and terminator, or for that matter, the transgenic and the hybrid, the control of the seed company over seed production is complete, to the exclusion of any participation by the farmers. With these instruments of control playing in tandem with an inexplicable and highly detrimental science policy that is coming into force in India and other developing countries, the farmer will be painted into the corner for essentially two reasons. The first is the fact that public sector institutions like the Indian Agricultural Research (IARI) or the stations of the Indian Council of Agricultural Research (ICAR) that are the centres of agricultural research and plant breeding are facing tremendous cuts in their research budgets. These centres produce new varieties of all crop types constantly. These new varieties are available to the farmers who produce seed and disseminated. The farming community has thus emerged as the nation's largest seed producer and distributor, producing over 85 per cent of the country's seed requirement.

Now with severe reductions in research funds, the capacity of public institutions to breed new varieties will also be severely diminished. In time they will cease to be the primary source of new varieties. This space will be occupied by private seed companies, specially foreign seed companies who have been clamouring for entry into developing country seed markets. When private seed companies become the primary suppliers of new varieties then certain things will happen. First, the farmer as seed producer will disappear. Second, the range of varieties produced in each crop will decrease, causing even worse genetic erosion than we are facing today. This will happen because production in seed companies is guided by profit margins, not the compulsion to provide a range of reasonably priced seeds. As past experience has shown, MNCs produce just one or two varieties and then push them on the market.

The other thing that will happen is that the farmer's source of new varieties will increasingly become only the private seed company. How will this happen. It needs to be understood that crop varieties growing in a specific area do not grow there successfully for ever. A particular variety which has been producing good results for the last few years could suddenly lose its disease resistance and become susceptible to pests. The soil and water conditions could change, salinity may increase or waterlogging take place. Deforestation in nearby areas could change the microclimate. Many things happen in

nature that can cause the collapse of a variety which had been well adapted and growing successfully.

When this happens, the variety needs to be replaced and another one brought in which can reintroduce the characteristics of yield and disease resistance. Given the fact that the public research institutions are getting pushed out of the business, the source for new varieties will increasingly become the private seed company. Once this happens, they will sell their seed on their terms and the farmer's choice will be restricted to buying from the seed company or giving up agriculture. In this fashion, the imperative of varietal replacement in the field will eventually force the farmer to turn to private companies for seed.

If the terminator technology is allowed to enter India the consequences could be mayhem in Indian agriculture leading to reduced availability of food and possible starvation deaths. This is no far fetched doomsday scenario. It is known that pollen carries the foreign genes of transgenic crops across large distances and transfers it into other crops. The terminator gene through the method of cross pollination could reach all kinds of crops in all kinds of places, inducing large-scale sterility. If one keeps in mind that the terminator application is planned for staple food crops, large-scale sterility can only have one consequence: imperilled food security and near certain starvation deaths.

Health and Safety at Workplace

Loopholes in Law

Jagdish Patel

Although the Factories Act provides for adequate health and safety monitoring at the workplace, its implementation has been consistently poor and inefficient. A survey of the prosecutions conducted under the act in Gujarat.

THE Factories Act was enacted in India in 1881, after the demand raised by Lokhande and his colleagues, to stop child labour and prevent accidents in factories. There was a provision for guarding the rotating parts of machine in this act. Thus the history of Section 21 of present Factories Act 1948 dates back 115 years. In spite of this provision hundreds of workers still get maimed and die due to lack of adequate machine guard. Society is not mature enough to implement a century-old provision.

The implementing authority for Factories Act is the state government. The labour ministry appoints labour commissioners under whom is chief inspector of factories and his team. In Gujarat there are 96 inspectors working in 14 offices. The International Labour Organisation (ILO) standard is one inspector for every 150 factories. There are 22,000 registered factories in Gujarat. As per these standards, Gujarat would need 146 inspectors in all. Factory inspectors in Gujarat are also assigned the responsibility of implementing the Payment of Wages Act, Maternity Benefits Act, equal pay for equal work rules, rules for disabled person employment, part of Environment Protection Act and a few other. The Factories Act is in 11 chapters and 120 sections; the state government has enacted the Gujarat factory rules comprising over 114 rules and several sub-rules and schedules. Thus the job of a factory inspector is definitely a challenging one. The lack of budget allocation is a major obstacle in the development of this regulatory authority.

An evaluation of the implementation of the act can be done by looking at the number of accidents/incidents/injuries/fatalities on one hand and the number of prosecutions and extent of punishment, on the other. Implementation of legal provision is directly related to awareness, knowledge and the commitment of the society in general and factory inspectors in particular. Poor infrastructure for implementation makes the law a useless piece of the Constitution. The major objective of the act is to prevent accident and injuries or lower the number of such cases. Unfortunately, the law is not utilised for this but is used, to some extent, to frame charges after the accident/incident has taken place.

Presented here is a study of prosecutions initiated by the Factory Inspectorate, Baroda in 1995 for violations of provisions for health and safety in the Factories Act. In all 140 complaints were filed in criminal court against 97 factories.

Fatal Accidents: As per the Factory Inspectorate Office (FIO) 15 fatal accidents were registered in 1995 in Baroda. Of these the FIO initiated prosecutions only in eight cases. Presumably, in the remaining seven cases, fatal accidents took place even though a law was not violated. Thus, in 47 per cent of cases the law has not helped to prevent the accident. Is the present law poor to this extent? To examine this, details of each accident would be necessary, which is not available.

Among the eight cases for which complaints have been filed, two are for not providing personal protective equipments, two cases are about violation of Section 32(c) which is about safety of workplaces at a height. One case is about the lack of machine guarding while another has violated the provision regarding testing of pressure vessels. There is no information about one case. There are 11 cases against seven factories.

As per Section 88 and rule 103, certain accidents have to be notified to the FIO within the stipulated time period. Definitions of 'factory', 'manufacturing process' and 'worker' are given in the act. PTRC collects clippings from local newspaper about work accidents. All the accidents occurred during manufacturing process are taken cognisance of by the FIO. 'Construction' is not considered to be part of 'manufacturing process' by the FIO. Based on clippings we have prepared a list of fatal accidents in Baroda in 1995. It is possible that all the workplaces in our list may not be registered factories. But, if we look at the list, it includes names which are certainly registered factories, e g, Indian Petro Chemicals (IPCL), Paragon Engineering, Modern Petrofills. Fatal accidents in these units are not included in the list of fatal accidents prepared by the FIO. All of these did not occur during 'construction'. At least five fatal accidents can be added to the official list of fatal accidents. (See Annexure Tables 1 and 2.) In response to an article published in Gujarati, the FIO clarified that all fatal accidents even those occurring during activities other than manufacturing (as defined in the act) like construction, are taken note of. After investigation fatal accidents which have occurred in non-manufacturing period are labelled as 'non-legal', while others are labelled 'legal'. No action is initiated for

Table 1: Type of Industry

Industry	No of Prosecutions

5	2

'non-legal' accidents. Non-legal accidents are not taken account of in the official data on accidents. Using this ruse some employers probably get an 'advantage'. For example, in IPCL a worker fell down and died. This is not in the official list. In another incident a worker died during fabrication at Modern Petrofills; this too, do not find a place in the official list.

There are 250 industrial units in Gujarat identified as Major Accident Hazard (MAH) units, out of which 55 are in Baroda district. It is natural that FIO keeps a close watch on these units to prevent major mishaps. As per the official list, no fatal accident took place in any such unit, though our list includes one such unit. During the year 1995, FIO filed 16 complaints against nine MAH units for various violations – three are for failing to provide shower near storage of acid/alkali, two are for absence of local exhaust system to prevent free movement of toxic gases/dust in the workplace, and one for not providing a guard on the moving parts of a machine. It is noteworthy that four complaints are against public sector like GSFC.

It would be interesting to know which violations are taken seriously enough by the FIO to lodge criminal complaint or which violations prompt action from the FIO. In all, there are 140 cases. Ch IV of the act has provisions for safety consisting of 20 different sections. Of these eight sections have attracted 56 cases. In addition 67 cases are registered for violation of Gujarat factory rules. Of these 31 are for different schedules of rule 102, 12 cases for violation of Rule 60 and 20 for Rule 61.

Rule 61 refers to pressure plants. Sub-rule 61(6) is about testing of pressure plants at regular intervals and test certificate to be kept in Form No 11. Out of 20 cases, 14 are for the violation of this sub-rule. All 12 cases filed for violation of rule 60 are violations of sub-rule 60(2). This sub-rule provides for testing of chain pulley block, rope and other lifting tackles and the certification in Form No 10. A newsreport (July 3, 1994) gave details of 114 prosecutions against 52 factories in Ahmedabad region. The majority of the cases were for the violation of the same Section 21, rule 60 and 61. Under rule 102 the state government has declared some of the processes as dangerous. FIO, Baroda lodged 31 complaints for violations of provisions made under this rule. Out of these 10 are for lack of shower near storage/handling of acid/alkali (Schedule 12-5), while 10 others are for Schedule 24, which is about safety during welding/cutting.

Some 56 complaints pertain to eight different provisions of the act. Of these 26 are under Section 21, 17 for 21-i-4b and nine under 21-i-4c; 10 cases are for violation of Section 37-i-c which provides for effective covering of all sources of spark to prevent fire. A large number of injuries and fatalities happen as a result of fall from a height. Section 32(C) provides for giving adequate protection to those working at a height – five complaints have been registered under this section.

A newsreport published in *Indian Express*, August 23, 1996 gave details of 385 prosecutions against 85 factories registered in a period of six months in Saurashtra region. Excerpt: "...The focus is now on the small pottery units, which includes the floor and wall tiles manufacturers, which employ child labour. Many factories do not even have a single fire extinguisher or proper first aid boxes for use in case of emergency. In the small chemical or dye units, workers move around bare feet in chemical waste and residues resulting in skin disorders and loss of sensation..." Thus here is a new, welcome trend in the priorities of the FIO.

Which industry is a major violator or which industry is targeted by the FIO? Though the information based on which this study is done does not name the type of industry or product, we have tried to classify the list from the name of the industrial unit. In 15 cases the name was not suggestive of the nature of the industry. In the remaining 82 units, 45 are chemical units including chemical, pharmaceutical, paint, rubber, detergent, soap, etc (Table 1).

ANNEXURE 1. FATAL ACCIDENTS RECORDED BY FIO

Name of the Unit	No of Prosecutions	Violation Charged
Amber Sugar, Menpura	2	Sec 61 C/61-1-C
Fibre Steel, Makaerpura	1	Sec 7-a-2-a
Industrial Oxygen	–	No prosecution
Pappu Product, Sardar Estate	1	Sec 21-1-4B
Lakhanpal National, Makaerpura	1	Sec 32-C
Satyadev Chemicals, Bhayli	1	Rule 102 Sch 12-4
Jaybharat Steel, Porbandar	–	No prosecution
Jambu Organics, Poicha	2	Sec 32-C Rule 103
Standard Pesticide, Nandesa	3	Rule 102 – Sec 15-12
Asia Brown Boweri, Maneja	–	No prosecution
Gujarat Refinery	–	No prosecution
Dynamic Rubber, Vaghodia	–	No prosecution
Priya Tiles, Porbander	–	No prosecution
Punjab Steel, Baroda	–	No prosecution
Amar Sugar, Bharthana	?	No information

ANNEXURE 2: FATAL ACCIDENTS IN 1995, REPORTED IN NEWSPAPERS

Name of the Unit	Injury	Fatality	Reason
Sugar Factory, Menpura	1	1	–
Indian Oxygen, Karjan	–	1	Cylinder Burst
Paragon Ind, Nandesari	–	1	Fall of object
Gujarat Quin, Tundav	–	1	Affected by gas on 5-10-94
Shrinathji Plastic, Porbander	–	1	Fire
Modern Petrofills, Porbander	2	1	Pipe broken during fabrication
Satyadev Chemicals, Bhayali	2	1	Acid splash
Sarabhai Chemical	–	1	Monkey jumped on him
Sarabhai Chemical Poicha, Savli	–	1	Fall from height
PVC Plant, IPCL	–	1	Fall from height
Asia Brown Boweri	–	1	Fall from height
Jaybharat Sterel, Probander	–	1	Electric current while taking bath
Darshana Fabrication, Wadi, Baroda	–	1	Electric curnet
Amar Autorikshaw, Pratapnagar, Baroda	–	1	Shirt entangled in lathe machine
Dymic, GIDC, Waghodia	–	1	Burns
Mamara Factory, Savli	–	1	Sari entangled in machine
Punjab Steel, Baroda	–	1	Iron Rod pierced stomach
Sugar Factory, Karjan	–	1	Fell in hot pan
Rupal Sugar, Karjan	–	1	Sari of 13 years old girl entangled in machine

Out of 97 factories found violating the act, 24 are situated in Nandesari area and 23 are in Makarpura industrial area. Industrial units in the city area like Gorwa, Pratapnagar, Sardar Estate, etc, account for 14 cases (Table 2).

Out of 97 factories, 69 account for only one complaint of violation while 19 have been slapped with two violations. There are two units, both engineering which account for five violations at a time; four units have been visited twice in a year and both the times they were found to be violating various provisions. Out of these, three units were found to be violating the same provisions as observed during earlier visit (Table 3).

The information base of this study does not contain a complete list of inspections carried out by FIO, Baroda in 1995 for health and safety. It gives information of visits with reference to the prosecutions only. We compared these dates with our list of accidents as reported in the newspaper. Newspaper had reported 21 cases of fire in factories, only two units have been prosecuted by the FIO – some of the major fires which took place in 1995 are the fire at Kohinoor Flour Mill, Gorwa, Bahubali Chemicals, Nandesari and naphtha tank of Gujarat Refinery. No action has been initiated against any of these units.

News clippings list 42 accidents. In 33 accidents no prosecution has been filed by the FIO. In the remaining nine units, 12 violations are observed by FIO and complaints have been lodged accordingly.

There is no clear information on whether violations were observed during routine inspection visit or during the visit after accident. While comparing the information with that of news clippings, many gaps are seen which may be for two reasons: Either all the accidents are not reported by the newspaper or some of the violations were observed during routine visit of the inspectors. Detailed research work is needed here.

The logical end of any prosecution is punishment, though punishment is not the ultimate aim of the whole exercise. Out of 140 cases against 97 factories, verdicts were passed in nine cases against five units at the time of collecting information. Fines imposed ranged from Rs 1,400 to Rs 5,000.

Framing charges is an important feature of any prosecution. Future course of legal action is directed by the charges framed. It would be important to know the extent of punishment suggested by the law. Section 92 reads: "...Provided that where contravention of any of the provisions of Ch IV or any rule made under Section 87 has resulted in an accident causing death or serious bodily injury, the fine shall not be less than Rs twenty-five thousand in the case of an accident causing serious bodily injury". After this amendment, four fatal accidents took place in Ankleshwar industrial area, in four different industrial units. All four units were prosecuted by local FIO. All four were found guilty by the court. Two of them were fined Rs 5,500 while two others were fined Rs 3,000. The charge against all four was violation of Section 7.[1] On the contrary, in a complaint of violation of rule 102, Schedule 12-13 against Gujchem Distillers, Bilimora, the court verdict was a fine of Rs 3,000 with one month imprisonment, even though this was not a case of accident or injury. Recently, in an accident in Ahmedabad, a worker lost three of his fingers, the occupier was fined Rs 50,000.

Workers and other social organisations, universities, researchers and media have failed to generate an atmosphere conducive to demanding that violations of provisions for workers' health and safety are considered seriously and the culprits are adequately punished.

As per the need of the time, laws are amended, if enough pressure is generated.

ANNEXURE 3: VIOLATIONS OF FACTORIES ACT AND RULES

Section	Description	No of Prosecutions
21(1) 4b	Fencing of machinery – every part of tran M/c	17
21(1) 4c	-do- -every dangerous part of any other machinery	9
28(1) aii	In every factory every hoists and lift shall be properly maintained and shall be thoroughly examined by a competent person at least once in every period of six months, and a register shall be kept containing the prescribed particularls of every such examination	2
28(1) c	the maximum safe working load shall be plainly marked on every hoist or lift, and no load treater than such load shall be carried thereon	2
28(1) e	Interlocking system for gate of cage to be provided	1
30(1)	notice indicating maximum safe working peripheral speed of grindstone or abrasive wheel, the speed of shaft and diameter of the pulley necessary to secure such safe peripheral speed	1
32 (C)	Safety of the person working at height	5
33(1)	Vessel, sump, tank, pit or opening in the ground to be securely covered or fenced	3
36(2) b	Work permit to be issued for working in confined space	1
37(1) c	execution or effective enclosure of all possible sources of ignition	10
40(1)	Inspector can specify measures for building safety	5
Rule 61(6)	Form no 11	14
R 61(1) and (2)	PRovisions for pressure plant	6
R 60(2)	Examination of hoist/lift in form No 10	12
R 24(3) ii	Specification of accident in stipulated time period to the inspector	2
R 56(3) 6b	Guard to the circular saw used in woodworking	1

ANNEXURE 4: VIOLATION OF VARIOUS SCHEDULES OF RULE 102 OF GUJARAT FACTORIES RULES

Schedule No and Sub-Rule			No of Prosecutions
12.	Manipulation of acids alkalis	12	
	(5) water facility – arrangement of shower		10
	(6) Cautionary notice		2
08	Blasting Regulations	2	
	(2) Prohibition of sand blasting		2
24:	Welding/cutting operation with use of LPG/Acetylene/Argon	11	
	(2) 1 Gas cylinders not to be stored in the room where welding/cutting is being done		2
	(2) 7 Equipment - Fire extinguisher to be provided near weldong/cutting place		3
	(3) 2 Place of welding/cutting to be enclosed by stationery or portable screen		3
	(3) 5 Log book of examination of equipments and register of trained workers to be maintained		1
	(3) 7		1
	(5) 3		1
15:	Manufacture and Manipulation of Dangerous Pesticides		
	(6) Efficient exhaust draught to be used		1
03	Manufacture and repair of electric accumulators	2	
	(2) Definitions		1
	(3) Prohibition relating to employment of women and young persons		1
10:	Manufacture of chromic acid or manufacture or recovery of the bichromate of sodium, potassium or ammonium		
	(4) Washing facilities		1
11:	Manufacture or manipulation of carcinogenic dye intermediate		
	(5) Exhaust draught to be provided		1

After the Bhopal tragedy in 1984, the Factories Act was amended in 1987 while Gujarat Factory Rules were amended in 1995. While looking at the list of violations observed by FIO, one can note that the amendments are not translated into action. Provisions in Section 41-B, 41-C and 41-H are given weightage by Section 94 which provides for fine and imprisonment for violation of these sections. Section 41-F, too, is important for the health of workers. Not a single complaint is registered for these violations. There is urgent need to bring about change in attitude of inspecting staff. The status of occupational health is extremely poor in this country. There are some provisions for notification of occupational diseases like Section 89 and rule 104, but not a single violation has been filed. There is an urgent need for monitoring workplace environment. Right now there is only one industrial hygiene laboratory in the state. The number should be increased to four – one each for four zones, viz, Surat, Baroda, Ahmedabad and Rajkot.

Note

1 Charges of violation of Section 7 if proved do not attract fine as heavy as charges of violation of provisions of Ch IV or Section 87. Perhaps, charges framed under Section 7 are deliberately done so to help culprits.

ASEAN Co-operation: Reconsidering Non-Involvement

Vejai Balasubramaniam

While the principle of non-involvement has provided the impetus for regionalism within ASEAN, it is also hindering the greater integration of the member countries as governments pursue their nationalist agendas.

THE centrepiece of Association of South-East Asian Nations (ASEAN) co-operation is the idea of consensus and non-involvement in the internal affairs (read politics) of member states. But, while the spirit of consensus where decisions pertaining to ASEAN are arrived at and adopted following agreement of all member states appears a sound principle reflecting broad democratic ideals, that concerning non-involvement is not. To be purportedly not taking a position on an issue is in fact to have taken a position. In the case of south-east Asian politics this would mean a tacit support for the ruling government of the day with contradictory effect for regional integration. That is, on the one hand while the idea of non-involvement appears to have provided the impetus for regionalism, it appears to be on the other hand to be hindering the process of expediting greater integration as governments pursue their own nationalist agendas.

Following decolonisation at the end of the second world war, the objective of securing national independence was the main concern of the countries in the region. Here, two factors – communism and the national ambitions of the newly independent states – came to be viewed as threats by governments in the region. These two factors provided the impetus for regional co-operation in ASEAN.

Conceived as a social and cultural association ASEAN was seen as a vehicle which would help enhance understanding and promote friendly co-operation in the region. In this period, competition between countries resulting from the national ambitions of respective countries tended to receive slight attention as ASEAN's main concern was with keeping communist expansion in check. Thus, for example, the military annexation of East Timor by Indonesia was conveniently ignored as were ongoing contradictions in Malaysia-Singapore relations following the latter's split from the federation in 1965.

In the post-cold war period the contradictions which underlined relations between states in the region resurfaced and while they tended to be shrouded in the rhetoric of ASEAN consensus, they have nevertheless become patent in the wake of the economic crisis which has come to affect the region. Following 1997, the once touted Asian tiger economies are experiencing an alignment of sort and are in the throes of becoming harmless puppies. Gone was the Midas touch of their governments and with it their sense of confidence. The 'Asian values' debate, which the boom years had spawned and was set to challenge Weber's thesis in *Economy and Society* and the *Protestant Ethic* as well as discourses on Orientalism and the post-colonial discourse school spawned by it, has become a dead letter.

Henceforth, the aim of securing national interest has become paramount and countries which are seen as profiting at the expense of their neighbour becoming the object of disdain. The external threat has been packaged anew by governments. Turning to the Malay world, Singapore has unfortunately become the focus of much of the discontentment and even been blamed for exacerbating the crisis. Singapore's advanced infrastructure undoubtedly ensured that it was well poised to capitalise on the region's modernisation which was spurred by foreign capital. That is, with its modern infrastructure (both in the physical and services sectors) foreign capital interests intending to penetrate the region invariably used Singapore as their regional base. (This was also assisted by Singapore's ability to package itself as an island of calm in a sea of uncertainty.) Thus the modernisation of the Malay world had greatly contributed to Singapore's economic wealth.

At a time when the region was economically the most dynamic in the world the advances Singapore made tended to be marginalised. For its part, Singapore has come to see the crisis as stemming from systemic problems inherent to economies such as Malaysia and Indonesia where the nationalist objective to create a national bourgeoisie has among other things given rise to unsound disbursement of loans, etc. At the same time, it is also easy for the Singapore authorities to point out that it is its advanced status, economic and political stability and needs that has helped expedite its neighbours' modernisation. This notwithstanding, the fact that the economic crisis has come to knock on the door of politics (to use Trotsky's comment on the kulaks entering the door of politics of the Soviet state in the 1930s) such that the democratic states in south-east Asia, Malaysia and Singapore, stand apart as the two countries which are yet to experience leadership change, the bogey of external threat has resurfaced and contributed to acrimonious debates between them.

As of July last year (the time when the economies began their downward slide) three issues proved contentious. The first was related to Singapore's relocation of its customs and immigration facilities to Woodlands just across the causeway from Johore – Malaysia's southern most state – with repercussions for rail-bound passengers travelling to and from the republic. Since the construction of the causeway and the rail link which ran alongside it from Johore to Singapore rail-bound passengers travelling to and from the republic would embark and disembark at the Malayan Railway and following independence Malaysian

Railway terminus at Tanjong Pagar (also known as the Tanjong Pagar Station) located at what is now prime land close to the heart of Singapore. The Singapore authorities had already made mention to their counterparts in Malaysia of the decision to relocate and high level meetings had been held over the past two years. Most of these meetings were inconclusive, during which time the Singapore authorities had gone ahead with infrastructure development in Woodlands, while keeping their Malaysian counterparts informed. But when the date of actual relocation approached in May the Malaysian authorities voiced their disapproval.

That the authorities in Malaysia had been silent stemmed in large measure from their concern over the economy which had begun to face a severe battering. The country was posting the worse economic growth rate since independence; the Malaysian ringgit had depreciated by some 60 per cent against the greenback and was continuing its downward slide; Malaysians were transferring funds to Singapore banks which were offering lucrative interest rates; unemployment figures were set to rise as companies saddled with large debts began to downsize; the region was experiencing a net outflow of foreign funds. All these factors had created a sense of uncertainty in the polity used to almost three decades of positive growth and rising standards of living.

In attributing the economic slide to money market speculators, the Mahathir administration sought to interpret it as part of the machinations of the latter's interlocutors in the west. No explanation was given as to why, apart from that the west was envious of the country's progress and ambitions. In such a scenario, it was but a short step for the authorities to view Singapore's relocation of its customs and immigration facilities to Woodlands with disdain. Once again patriotism was whipped and Singapore seen as being insensitive and disrespectful of Malaysia's interest.[1] In the ensuing standoff both Singapore and Malaysia were intransigent with the former sticking with its decision to go ahead with the relocation in May and the Malaysians standing firm in not moving from Tanjong Pagar. That the authorities in both countries could feel that the other was being unreasonable has roots deeper than the crisis. Singapore depends on Malaysia for much of its fresh water supply with obvious implications for the need to maintain cordial relations. But at the same time it is this dependence which it sees as reason for Malaysia's intransigence and foot-dragging on issues which it feels are pertinent. For Malaysia, Singapore is seen as an exploiter and one who has gained far more economically at Malaysia's expense and it is in this light that its plan to relocate the CIQ facilities to Woodlands is viewed. In a scenario where both countries are facing significant economic challenges the hardline position adopted by the authorities on both sides of the causeway did much to divert attention on the pressures exerted on the governments by international finance institutions and organisations. Of late governments in the region have come to face pressure for greater transparency and democracy in administration as the key to emerging out of the present crisis. The patriotism engendered by the contention in Malaysia-Singapore relations did much in helping the authorities package themselves as defenders of national pride and interests.

This notwithstanding the crisis had important long-term implications for regional co-operation. In bringing to the forefront once again the issue of exploitation, the Malaysian authorities have begun to campaign assiduously among importers and exporters to divert trade from Singapore to Port Klang and have it transformed into the regional shipping hub. The implications of this for Singapore

which has traditionally played the role as the region's shipping hub while obvious too means that rather than enhancing regional co-operation and capitalising on comparative advantage there will be increased duplication with implications for the allocation of scarce resources.

Another measure adopted by the Malaysian authorities was designed to undermine Singapore's position as the regional financial centre. To this end policy was formulated to end trading in selected blue chip shares of Malaysian companies and repatriate the stocks of Malaysian ringgit deposited in Singapore banks and financial institutions by making the ringgit not tradable overseas and stocks of the currency kept overseas worthless paper. Both measures were rationalised as helping to provide the much needed capital by increasing deposits in Malaysian banks following the return of capital as well as to shore up the Kuala Lumpur Stock Exchange. Released at the same time was former prime minister Lee Kwan Yew's long awaited memoirs. Although the Singapore authorities had alluded to it as personal and not an official document, its reference to communalism and racism on the part of political leaders in Malaya and the release of the book at such a time no doubt would have appeared more than a coincidence to say the least.

As expected, this set the next stage in the contention with the announcement by the Malaysian ministry of defence on the subject of Singapore military aircraft straying and trespassing into Malaysia's airspace. (Incidentally among the personalities Lee had taken a swipe at in his memoirs was the father of the present minister of defence of Malaysia.) In view of the proximity between Singapore and Malaysia, planes of the Singapore Air Force have had a tendency to stray into Malaysian airspace quite often without securing prior official permission. In view of Malaysia and Singapore together with New Zealand, Australia and the UK being members of the Five-Power Defence Agreement (FPDA) such incursions used to be tolerated. Henceforth, however, no such incursions would be acceptable without official sanction.

While these economic and political measures were set afoot, things were coming to a head in Malaysia following the sacking of Anwar Ibrahim, Mahathir's heir apparent, from the cabinet as deputy prime minister and minister of finance and as deputy president of the United Malays National Organisation (UMNO).[2] This charismatic leader had attracted a large following and his summary sacking drew large demonstrations in Kuala Lumpur. Arguably, the Mahathir administration was now facing its greatest challenge. More important was its potentially divisive effect on the mass of Malay supporters in the country from whom UMNO draws its electoral base.

The source of the problem between Mahathir and Anwar can be traced to differences on how to handle the economy. Among the charges levelled against Anwar was treason, implying he had co-operated with an external power to undermine the country and its administration. To be sure there were policy differences between Mahathir and his deputy on the subject of the 'right' economic policy to deal with the crisis. Anwar's position was closer to that of the IMF which advocated a regime of tight monetary policies, the effect of which was felt by middle and lower income groups who now had to deal with higher interests on loans as well rising cost of living; and by businesses under the control of sections of the nascent national bourgeoisie[3] which was spawned through government policy introduced in 1970. Mahathir on the other hand came to see in the IMF's strategy a recipe for disaster (the reference to the IMF as the 'kiss of death' by the Cuban leader Fidel Castro comes to mind). Accordingly he favoured a more relaxed monetary policy, that is, the easy availability of credit as the best guarantee of taking the country out of recession, and the need to come to the assistance of the Malaysian 'zaibatsu' under the control of the national bourgeoisie as 24 per cent of their profits were channelled to the national coffers through taxes. The fact that Anwar was chairman of the IMF's Committee on Development could explain the relationship between his economic policies and those of the Fund. But to infer from this that he was co-operating with foreign powers was quite a big step hence it was not with treason that he was formally charged, but with sexual offences.

The once militant firebrand who was seen as leading Malaysia into the 21st century is accused of being a bisexual who engaged in extramarital sex and had used his position to enlist the co-operation of the police in extracting statements from his partners denying them – an offence which carries the charge of corruption. With Anwar out of the way and Mahathir assuming the finance portfolio a more relaxed Keynesian type economic policy minus the social welfare dimension has been introduced.

This seemingly internal political development was to have important ramifications for Singapore which prior to the Malaysian political crisis had stated its intention to bring Malaysia's trade policies, such as those mentioned above, before the World Trade Organisation. Reeling under the possibility of a fresh round of retaliatory measures from Malaysia following the live interview carried by CNBC in Singapore with members of Anwar's family, Singapore authorities extended their co-operation to police officers from Malaysia who had gone to the republic to question CNBC and promised to assist in gagging the media based there. But, as mentioned earlier, its apparent non-interference approach is for all intents and purposes a support for the Mahathir administration and this appears to place Malaysia-Singapore relations on a more amicable footing. Yet the fact that the concept of non-involvement is double-edged cannot be denied and will therefore continue to underlie the dialectics of ASEAN co-operation.[4] It is time that ASEAN realises that the best guarantee to prosperity lies in greater regional economic co-operation and removing unnecessary competition among member states and this entails proactive involvement in their national interests. The economic crisis affecting the region has not only entered the door of politics of south-east Asia but is also begun pressing for a change in ASEAN co-operation.

Notes

1 Indonesia too shares a similar view with Malaysia which can be seen in the Indonesian president Jusuf Habibie's comment that Singapore "is not a friend in need" See *Asian Wall Street Journal*, August 1998.

2 In Malaysia's communal political set-up, UMNO is the leading member of the ruling Barisan Nasional (National Front) coalition of 14 political parties. The leader of UMNO is the chairman of Barisan Nasional and holds the post of prime minister For a discussion of politics in UMNO, see A B Shamsul, 'Battle Royale: The UMNO Elections of 1987', *Southeast Asian Affairs*, Singapore: Institute of Southeast Asian Studies, 1988; Fan Yew Teng, *The UMNO Drama: Power Struggles in Malaysia*, Kuala Lumpur: Egret Publications, 1989; Vejai Balasubramaniam, 'Vote for Unity: Malaysia's Ninth General Election', *Economic and Political Weekly*, June 10, 1995

3 For a discussion on aspects of the role of government in creating the national bourgeoisie written from the standpoint of rent capitalism, see Gomez and Jomo, *Malaysia's Political Economy: Politics, Patronage and Profits*, Cambridge University Press, Cambridge, 1997.

4 Indonesian president Jusuf Habibie expressed his hesitation to attend the APEC summit in Kuala Lumpur on November 16, 1998. Habibie and Anwar are known to be close allies While this would indicate the emergence of a contention in Malaysia-Indonesia relations, the Malaysian authorities, however, had issued a statement denying any such possibility for concern of embarrassment in the event Habibie did not attend the summit.

Making Sense of Conflict

Rowena Robinson

Social Conflict edited by N Jayaram and Satish Saberwal; Oxford University Press, Delhi, 1996; pp 563, Rs 645.

SOCIAL CONFLICT edited by Jayaram and Saberwal is a welcome addition to the series, Oxford in India Readings in Sociology and Social Anthropology, whose general editor is T N Madan. Jayaram and Saberwal remind us in their introduction that sociology must confront conflict. For a long time the perspective on conflict in the social sciences tended to have very little realism about it. The early preoccupation with order in the social sciences tended to locate conflict negatively, as being incompatible with structure, temporary and aberrant. However, conflict clearly needs to be recognised and grappled with empirically and theoretically. Discourses on modernity also tended to see conflict – particularly communal or ethnic conflict – as being a thing of the past, something that would disappear with time and 'development' or get reconfigured in 'class' terms. No such thing happened, of course, and social scientists soon had to confront and explain the occurrence of communal and ethnic conflict in modern times. Indeed, conflict can become an entry point through which the nature of contemporary society may be understood. This book draws on work in anthropology, sociology, history, political science and psychoanalysis. Most of its papers are published pieces, but there are new articles by Bjorn Alm and Saurabh Debe.

In India, we see the clash of cultural codes and countless dislocations attending industrialisation and urban growth, colonialism and the clash of western and Indian codes. Uneven development has led to the frustration of aspirations and sometimes stirred them beyond the limits of the feasible. Ideologies of protest and revolt, of everyday resistance, feed into the study of conflict. In the book, the different structural domains – of work, politics, family and culture – are viewed as each generating its own set of conflicts. Interpersonal and inter- and intra-group conflicts are represented and there is a section on conflict resolution.

This book is far too wide-ranging to permit here a detailed description and analysis of each of its 26 essays. I will present my comments sectionwise, probing deeper into specific issues and essays occasionally. The book is divided into five sections: family, political conflict, work, culture and conflict resolution. One must consider this a fairly provisional kind of division for Jayaram and Saberwal are certainly not suggesting that 'conflict resolution' is a separate domain altogether from the spheres of work, culture, politics or the family. Nevertheless, it is also obviously possible to empirically distinguish and appropriate to analytically focus on the strategies and modes of resolving conflict and also view the shifts and changes in these.

The book brings together old and more recent pieces. There is T N Madan's work on the family dating back to 1965, Charles Morrison's 1968-69 publication on lawyers, Galanter's 1972 essay on indigenous law and Jeffrey's 1976 work on the nayars of Kerala along with papers and excerpts from the 1990s. I am a little surprised, however, that the editors found nothing for the entire period of the 1950s and half of the 1960s to reproduce here. Feuds, factions and caste conflicts preoccupied many early writers including Bailey, S C Dube, Srinivas, Beals and others. Perhaps such pieces were not included because the editors felt they were easily accessible elsewhere. Still, a sense of the past of the study of this subject needed to be inculcated by showing early concerns, some of which, indeed, have now retreated from contemporary practitioners' minds, but certainly merit greater attention. This is even more true for a series that seeks to 'introduce th subject to the interested reader' and t capture 'diversities of approach'.

The first section on the sphere of th family contains five essays including a excerpt from Madan's classic study of th Kashmiri pandits. The partition of th patrilineal, joint household forms the foca point of Madan's and Rizvi's papers, whil Jeffrey looks at the disintegration of th 'taravad' among the matrilineal nayars Ramu's paper raises interesting question regarding marital interaction and day t day relations in urban, single and dua earner, middle class nuclear families. Th modern urban family is still an under researched area in the discipline and ther is much we need to know regarding th kind of role transformations an negotiations that take place in suc households.

Chandra's interesting paper on the nov famous Rakhmabai case suffers from som of the ill-effects of elision, which most o the other papers also necessarily bea Extraction for the sake of brevity, in thi instance, has meant that the paper does no explain why this case came up before th courts at all. Rakhmabai, against whon her husband Dadaji brought a case fo restitution of conjugal rights, belonged t the pachkalshi caste. In a case like this the caste 'panchayat', had Dadaji appeale to it, could have ordered Rakhmabai t join him or pay a fine. The husband woul thus have got compensation and th marriage would have been dissolve according to caste norms. However, Dadaj did not choose this option. He took direc recourse to the English legal system in th hope, probably, of obtaining Rakhmabai' property, which the caste panchayat woul not have given him but the British court

might have. Thus customary law and usage came up in conflict against British interpretations and legal principles.

The section on the cultural sphere has seven articles, ranging in theme from caste to labour and communal conflicts. The papers range historically from the late 19th century to the present and attempt to reflect the variety of approaches used to study violence from the psychoanalytical (Kakar) to the detailed empirical and micro-analytical (Phadnis, Alm) to the symbolic and discursive (Das, Dirks). The relationship between ritual and resistance is explored in Dirks' article on the subject which queries the axiom that ritual is solely patterned activity, a mechanism for the production of social order. He argues that rituals provide a means for the articulation of community rank and power and they often occasion more conflict than harmony or consensus.

Veena Das' essay actually connects up with her work on the cultural rights of communities, which she has articulated elsewhere and which could have been a beneficial addition to this volume. It is important because it focuses on one of the most critical areas of recent political mobilisation in India. In the paper included in the book, Das analyses Sikh militant discourse and the ways in which it defines self and others, both Hindus and the state. The paper, however, is linked with larger concerns, which are worth recording here. The question of cultural rights, as Das argues, brings up issues of contestation and conflict not only between the state and community, but also between communities and between the individual and the community. Law and history are experimented with in the attempts made by communities to shape their identities in relation to each other in the contemporary political culture. Das articulates another need: for communities to become a vitalising force in shaping the public culture by refraining from the attempt to establish complete and hegemonic control over their members thus permitting the resistance and experiments which could create new forms and which are the *sine qua non* of human freedom.

The sections on the political sphere and work sphere are a chronicle of the varieties of conflicts pre- and post-independence India. Industrial and agrarian tensions are focused on (Ramaswamy and van Wersch, Beteille and Oommen). Agrarian social structure and change still remains a generally under-exposed area in the discipline. It is good to have Beteille's seminal work represented here and Oommen's skillfully researched paper. It is a pity, though, that we have no reproduction from Chakravarti's pioneering work on the changing character of elites and the nature of confrontations such shifts in power given rise to in the agrarian set-up.

The chronicle of conflict charts the changing political history of India, the shifts in sources and bases of power, the nature of political elites, contestation among those elites for the control of vital political resources and the relationship between local, regional and national, micro- and macro-level political arenas. The analysis of the dynamics of conflicts intersects with an attempt to understand its translation into the lives of people – the experiential level of conflict for those involved (Kakar and Chowdhry). Caste, class and party all get charted in this section on political conflict.

The final section is on conflict resolution and perhaps the most exciting section of the book in terms of prospects for further research. As the editors rightly point out in their introduction to the section, "while we have excellent anthropological reports on indigenous modes of resolving conflicts, comparable accounts of how modern courts handle disputes are hard to find".

The argument regarding the alien character of western legal institutions has often been made (Cohn). What some of the paper show, however, is not only the sheer tenacity of the western complex and the way it has survived, indeed even thrived, in India but also the ways in which western legal forms have lost their foreignness and become utterly and inextricably domesticated (Morrison, Kidden). Dube looks at the ways in which disputes get refashioned as they move through the judicial process from the moment of their inception in familiar areas of village life, kinship, neighbourhood and affinal connections. The paper, which looks at two disputes from Chhattisgarh of the 1920s and 1930s, uses the disputes to enter into the play of village relationships. Exploring the gap between the laconic language of the judgment and the rich texture of the witnesses' depositions permits entry into the patterns of relationships, of fellowship and enmity, of the variability of everyday village life. Another interesting paper (Morrison) is on the social origin of the professional group of lawyers. The paper analyses the court structure as a social space. It looks not at disputes but the entire system of social relations and forms of interaction that arise among professional lawyers in district courts. All in all, this is a good book. A little expensive perhaps, though don't let that put you off Certainly, every social science library should have it.

Small Capitalists and Entrepreneurs

K V Ramaswamy

Small Business Entrepreneurs in Asia and Europe: Towards a Comparative Perspective edited by Mario Ruttan and Carol Upadhya; Sage Publications, New Delhi, 1997; pp 334, Rs 395.

THIS is a book about small capitalist entrepreneurs in selected countries of Asia and Europe. It brings together studies carried out in six Asian countries, namely, India, Thailand, Malaysia, Indonesia, South Korea and China. This set of studies is followed by a section containing three papers which discusses entrepreneurial behaviour in the Netherlands during the 17th and the 18th centuries and in contemporary Italy. They provide a summary of the nature of small entrepreneurs in Europe. The three stated objectives of this book are: (1) to study the role of new emerging business groups operating in provincial and rural areas; (2) to provide a different perspective on the nature of capitalist development in Asia today; and (3) to contribute to the process of developing a common theoretical framework that will facilitate objective comparative studies in future. The editors bring out the necessary elements of such a framework in the introductory survey. On the basis of this survey editors favour an approach which integrates political and economic structures and an understanding of cultural context with a human agency. Such a model should enable individual action (the innovating, risk-taking entrepreneur) to be related to the macro-economic processes that constitute development.

Upadhya (Chapter 2) traces the emergence of the caste group kammas as a prominent regional capitalist class in coastal Andhra Pradesh. Kammas are found to enter 'modern' businesses such as industry and construction. The retail and wholesale trade remains in the control of traditional old business communities (example, komatis). Caste, it is argued, is a major means of consolidating class positions. Caste-based networks are instrumental in ensuring business success. Business associations play an important role in networking strategies of entrepreneurs. Political struggle to control one such association (Vapi Industrial Area) is described by Gorter (Chapter 3). Here,

technocrat first generation entrepreneurs attempt a formalisation of access to government superseding contact through friends, caste fellows and corruption. Through their political contacts they can control labour problems better, get generous subsidy schemes approved, and construct a common effluent treatment plant to reduce pollution. The holding of political office in Thailand (Chapter 4) gave brickyard owners access to local labour which was in short supply. They are disproportionately successful in obtaining funds from the provincial administration to develop infrastructure in their district. The need to nurture and develop political contact is greater in the context of local nationalism as in the case of Chinese businessmen in Malaysia (Chapter 5). Iron founders in central Java (Chapter 6) have used the control of co-operative societies to improve their economic returns. The rapid growth of private entrepreneurs in China under the liberalised regime is fostered by kinship ties and those of connections with officials (Chapter 8). In a sample of 1,440 enterprises more than 37 per cent of the owners' closest relatives and 42 per cent of their friends are found to be officials. Access to information regarding policy changes is better for those with official connections. In brief, networks are found to be crucial for the functioning of small businessmen whatever be the basis for building up network (caste, clan, kin, and ethnicity). The objective for its use is shown to be similar across the selected countries. Networks may be viewed, following Bourdieu's theory, as social capital, which people mobilise through their social relations. The success of industrial districts in Italy (Chapter 10) is closely connected to the use of networks, which promotes collective efficiency.

What have we learnt about the entrepreneur and the craft called entrepreneurship in rural areas in these selected countries? Can we regard caste-based networking and agricultural surplus as sufficient conditions for the emergence of small capitalist class? Personal trust based on caste as in Indian networks is exclusive. This can block collaborative relationships across communities as in Agra footwear industry (*Economics of Collaboration: Indian Shoe Makers in Between Market and Hierarchy* by Peter Knorringa, Sage Publications, New Delhi, 1996). What factors help or hinder entrepreneurial activity in a situation of rapid localised agricultural growth? The selected countries differ widely with respect to state policies. How do different social systems create an enabling environment for small business in rural and urban areas? Differences between economic systems are more appealing than similarities. Contrast the reported lack of interest in political activity, absence of business diversification trend and partnership among producers in Punggi (South Korea) textile industry with that of industrialists in Indian industrial estates. What explains such differences? These questions are not adequately answered in the book.

Of the three stated objectives, the first objective is apparently met as the case study approach leads to description of the local processes at work in detail. Is network logic different between or common to countries and cultures? Do they (different bases of networking) lead to different outcomes in terms of performance. Editors cite a paper by Biggart (page 31) but none of the contributors mentions this work. Large firms dominate industrial structure more in Korea than in other countries. Foreign firms are prominent in Malaysia not so in India. Presumably, different ownership and size structures – important elements of economic structure – will have differential impact on the formation and efficacy of small business class. How and why? These questions are not posed in this set of studies.

The outline of an alternative perspective on the nature of capitalist development in Asia remains unclear. Any attempt to formulate an integrated framework needs to be preceded by a discussion of definitional issues. Can we regard an iron founder in Java or brickmaker in Thailand as an innovative and risk-taking entrepreneur, affecting and affected by social and technological change in a rapidly industrialising society? The term entrepreneur in the case studies seems to be loosely used to refer to the owner of a small-scale but growing and successful business or to a self-employed person. We may note that neither of them necessarily involves in any innovative activity.

The usefulness of this book lies in focusing attention on the small entrepreneur. In the decade of structural adjustment small business is likely to be subject to various external shocks. In Thailand brick producers are threatened by the entry of large-scale export oriented enterprises (page 140). How the small capitalists as a class respond to this change is an important subject for study. The role of different institutions, cultures and economic policies in easing the possible negative impact is not well understood. The importance of networks for small entrepreneur development, as described in this book, can be factored into development policy.

Hedge Fund Terrorism and Regulatory Inertia

D N Ghosh

In the international financial system, following rapid consolidation and institutional changes, we are witnessing the highly concentrated power of a progressively smaller number of market participants. This has made the financial system a perennial breeder of systemic risks.

THE spectacular bail-out of the Long-Term Capital Management hedge fund set off more ripples than the debacle itself. Orchestrated by the Federal Reserve this late night rescue has embarrassed all those who are busy preaching the doctrine of market discipline the world over. James Leach, chairman of the US Congress house committee, saw in this rescue action a loss of the moral authority of the US and observed during the course of evidence-taking of Federal Reserve chairman: "The Fed's intervention comes at a time when our government has been preaching to foreign governments, especially Asian ones, that the way to modernise is to let weak institutions fail and rely on market mechanisms rather than insider bail-outs. The long-term benefit to the market would perhaps have been greater and more lasting than any temporary disruption to the US economy." However, more than the moral hazard issues, it is the nature of operations of the hedge funds and their interface with the regulatory authorities that are uppermost in the minds of those concerned with the stability of the international financial system.

Hedge fund operators are the cream of Wall Street investment bankers, a class of financial elite *par excellence*. They are limited partnerships, free from any regulatory restrictions normally applicable to traditional mutual funds. The hedge funds can buy stock.., bonds, commodities (such as gold and oil) and international currencies, can invest in futures and options, putting up a small portion of the securities' value in order to buy or sell. They are free to borrow to invest. Their strategy is to notice and exploit small yield and price discrepancies in bonds and currencies with programmed buying and selling based on certain assumptions about the future. There are various estimates of their numbers and resources; they range up to $400 billion comprising some 4,000-5,000 unregulated hedge funds. Arguably the size is not large in relation to resource flows in the financial markets, but then size has to be seen in some perspective. Viewed in relation to their exposure in the emerging markets, this is more than the World Bank estimate of the outstanding bond market debt of the developing markets. This is also more than double of the combined equity market capitalisation of Thailand, South Korea and Indonesia at the start of the Asian crisis in June 1997. In Thailand alone a single hedge fund had reportedly taken an exposure of about 20 per cent of the country's official reserves. All these figures are without taking leverage support provided by banks and investment institutions.

All hedge funds cannot be painted with a single brush. There are a large number of low-risk-low-leverage funds which advertise themselves as market-neutral. A good number of funds which dominate the market are no ordinary players; they are the Machiavellies in the financial game strategies of today, taking advantage of arbitrage opportunities across a wide array of market instruments all over the globe wherever these exist and creating such opportunities wherever possible, not hesitating to act in concert to see that their speculative bids succeed. Either singly, if it is a large fund, or by the pooling of resources of several small funds, they can play about with the economies of small and medium countries, bringing them to the brink of bankruptcy. Hedge funds came to widespread public attention when George Soros, the guru of hedge funds, sold an estimated 10 billion pounds short in 1992 and netted a profit of 2 billion pounds. His fund as well other funds had been betting heavily in the bond and currency markets. Some of the consequences are history now.

The moves of hedge funds are closely guarded secrets. This secrecy is their stock-in-trade. They set their own rules of the game and behavioural transparency. Issues of morality crop up in the execution of their business strategies. This psychology is captured pithily in a recent interview given by George Soros: "There are collective interests that don't find expression in market values. These collective decisions and even individual decisions must involve the question of right and wrong. I think markets are amoral, but moral values are necessary to prevent their excesses and inequities." Elaborating further on the way he conducts his own business in the competitive market, he clarifies: "Because I consider the market amoral, I am concerned as a businessman with being a successful competitor in these markets. At the same time, I recognise that I am also a human being and as a member of society must be concerned with moral issues. But if I allowed moral considerations to influence my investment decisions, it would render me an unsuccessful competitor. And it would not in any way influence the outcome because there would be someone else to take my place at only a marginally different price." (Interview of George Soros with Jeff Madrick in 'Behind the Financial Crisis', *New York Review of Books*, January 14, 1999.)

The regulators in the US virtually kept their hands off, relying, so it seemed, on the reputation of the fund managers as proxy for their own surveillance. The fund managers have been enjoying unrestrained freedom of operation. Information available with different regulators, as it now comes out, was far too inadequate for the kind of surveillance needed for overseeing the impact and consequences of their decisions on the stability of the financial markets. The debacle set off a wake-up call for the regulating community. The observations made by the regulators are revealing. It appears that there was no filing requirement for the hedge funds to report the extent of their borrowing with the Securities Exchange Commission. The Federal Deposit Insurance Corporation made an Indirect admission that it had not been reviewing commercial banks' hedge fund positions. The Commodity Futures Trading Commission admitted that the reporting on borrowing against swaps was inadequate and had serious loopholes. Currently, the US regulators have started investigating the transactions of hedge funds with several large Wall Street bankers in early 1998. In an ironical twist some of the hedge fund managers are now shifting the blame to them for being generous with their leverage support. The use of leverage has been an accepted market practice, notwithstanding its highly destabilising risk implications. The world now knows that Merril Lynch, J P Morgan, Goldman Sachs and Travellers Group, the elite of the America's financial powerhouses, a few dozen other global heavyweights and an array of state entities called strategic investors were part of the game; they either did not know what risks they were taking or were comfortable with the high-risk activities. Indeed in hindsight it does stand out as an extraordinary combination of myopic decision-making by the lending

institutions and open-ended forbearance by regulatory authorities.

The earnings of hedge funds, at least in many cases, were between 35 and 40 per cent; the market knows how that sort of money could be earned only by leverage; and the Federal Reserve (FED) would have to do a lot of persuasive explaining to convince the market why it could not have opted for pre-emptive inspection and instilled sanity in those banks and institutions which were on a dizzy spree of imprudent lending. FED could not but have been aware, even during the last four and five years when things were looking rosy that the collapse of even a medium sized hedge fund can pose a threat to the stability of the world's biggest economy. Were they in the dark? If so, it is a terribly worrying thought.

Perhaps it is some consolation that the FED chairman admitted that there was a regulatory failure. He told a Congressional hearing that the hedge funds are not "technically regulated in the sense that banks are regulated but they are under a fairly significant degree of surveillance". He was reluctant to use the sledge hammer; that would be inconsistent with the commitment to preserve and nourish the creativity of the free market mechanism. He advised caution against rushing into a regime of direct control on the basis of one incident. In testifying before the House Banking Committee, the FED chairman as well the organisations which track the operations and performance of hedge funds expressed the apprehension that detailed regulation and control would drive the hedge funds offshore outside the US jurisdiction. Clearly FED would not ignore the lesson of the late 1960s, – the adverse consequences of the interest equalisation tax which created the giant euro dollar market and virtually took the market away from Wall Street. With tighter scrutiny and control over hedge funds there could be shifts of multi-trillion dollar hedge funds and derivatives business to accommodating offshore centres. At a time when a large pool of surplus funds is waiting to be profitably invested and the increase in risk appetite from a large community of high net worth individuals is driving the market towards high-risk financial lending, the FED could not but take cognisance of the vital interests of the Wall Street investing community.

The FED's attitude is no consolation to regulators in small and medium countries. They are perplexed as to how they can contain and neutralise the decisions of international fund managers who come under the jurisdiction of the Federal Reserve as it seems unwilling to accept its responsibility of taking care of their concerns as well. Will FED move to contain the forces in their own countries which have the potentialities of acting as great destabilisers of the international financial system? This seems highly unlikely. Throughout the Asian crisis the western policy establishment had been playing down the role of the hedge funds. They put the blame on the countries themselves;

they are victims of their own folly, they chose to be the targets: a faltering economy, a banking system riddled with bad debts, fiscal irresponsibility and low order of reserves. The high levels of dollar debt in the corporate balance-sheets of three Asian countries and, in the case of Russia, the fall in oil prices and the failure to collect taxes were clearly indicative of vulnerability. Naturally, therefore, speculators succeed, so runs the argument, only when they see opportunities in policy weaknesses and ways to contain the 'ferocious beasts', as Mahatir calls these hedge fund operators, have to be found by the victim countries themselves; they have to correct their own policy weaknesses. True, the hedge fund managers or the investment bankers were not responsible for creating conditions which made the countries their targets and if the countries had the foresight and courage to set right their fundamental macroeconomic deficiencies, they could have avoided their evil eyes.

While some of the deficiencies in these countries are of their own making, it needs to be recognised at the same time that in a world economy moving towards more openness and integration, they need the support of a stable environment; they see how fragile this stability is and how defenceless they could be against attack form even a single hedge fund. It is this sense of insecurity which forced Malaysia to impose capital controls. In Hong Kong the attack was mounted by hedge funds borrowing shares and selling them on the assumption that prices would fall before they were returned and then engineering a fall in share prices by selling Hong Kong dollars which under the currency board system produces an automatic rise in interest rates. The Hong Kong Monetary Authority decided to counter the speculation against the currency peg by purchasing as estimated \$ 15 billion of shares on the Hong Kong stock market. In the process the government has saddled itself with shareholding of about 7 to 11 per cent of several key Hong Kong companies in telecom, information technology and airlines. The considerations that weighed with it have been transparently explained by the Hong Kong Monetary Authority. "The aim of the intervention is not to prop up the stock and futures markets. Our action is targeted at currency manipulation that took advantage of the automatic adjustment mechanism of our currency board system to produce extreme conditions in the interbank market and high interest rates, in order to profit from a short position in stock index futures. We wish to send the very clear message to those manipulating our currency for this purpose that they may stand lose money instead. But if there were no currency manipulation, there would be no such intervention." (Joseph Yam, chief executive of the Hong Kong Monetary Authority in his statement 'Why We Intervened', *Asian Wall Street Journal*, August 20, 1998.) Malaysia's imposition of capital controls and Hong Kong's intervention have worries for the international investing community; they apprehend that many developing countries may be driven to a withdrawal syndrome. Hong Kong could ward off the threat because it was an exceptionally strong position to do so; it is not a precedent which others can follow.

Currently, after the LTCM debacle, hedge fund operators are on the defensive. They are not as strident now in their blame-the-victim approach and are searching for ways not only to protect their turf but to bounce back. In a bizarre twist, George Soros argues that "the pain at the periphery has become so intense that individual countries have begun to opt out of the global capitalist system and with the inability of the global monetary authorities to hold it together, the world capitalist system would tend to disintegrate. The prospects are dim because the G-7 countries have just failed to intervene in Russia, but the consequences of that fall out may serve as a wake up call. There is an urgent need to recognise that financial markets, far from tending towards equilibrium, are inherently unstable. A boom-bust sequence can easily spiral out of control, knocking over one economy after another. Thus in finding a remedy, 'market discipline' may not be enough. There is also a need to maintain stability in the financial market." ('The Crisis of World Capitalism', *Asian Wall Street Journal*, September 16, 1998. Soros makes the same argument in his book published in December 1998.) His reform agenda is for a kind of International Credit Insurance Corporation to guarantee loans made to periphery countries. (His proposal, made in August 1998 to forestall the Russian meltdown, for an aid package of \$ 15 billion by G-7 and IMF did not find favour; his own hedge fund lost money in the Russian crisis.) The new proposal is to protect investors against losses without interfering with movement of capital flows and to help preserve freedom in capital market operations. In a recent article in *The Financial Times* (January 1, 1999) Soros has mooted yet another proposal: transform the IMF to act as an international central bank and as the lender of the last resort. In essence the institutional arrangements proposed are intended to secure protective cover for imprudent lenders and monetary accommodation for reckless speculative operators, to save them from the consequences of their own folly; they skirt around the basic issue of regulating and controlling the operations of hedge funds and high-risk financial trading operations.

In the international financial system, following rapid consolidation and institutional changes, we are witnessing the highly concentrated power of a progressively smaller number of market participants. Driven to make profit in a short-term time horizon, they play about with massive leveraged finance, building up complex trading relationships all over the globe for all kinds of products, commodities and services, taking trading positions at a moment's notice and unwinding them with no less alacrity. All these have made the financial system a perennial breeder of systemic risks. There is little evidence that political leaders of the western nations, in G-7 and other international gatherings, are coming to grips with the impact and consequences of the transformation of the nature and character of the forces driving global finance. The emperors and high priests of finance of today are talking of sophisticated bail-out mechanisms, perhaps stronger life-boats, a little more spacious, a little more accommodating to the periphery countries, launched with more cleverness and finesse. But all that would leave untouched the core issue. As the sources of instability are imbedded in the way in which the managers of hedge funds and allied investment bankers manage their global finance portfolios, the key industrial nations have to address this issue if they wish to preserve the spirit of enterprise and freedom and an internationally open economy.

G-7's call for greater information sharing, transparency and harmonisation of some supervisory practices would not remove the sources of instability in the creditor and debtor countries and assure a safe and sound global financial system. The debtor nations have to be effectively brought into the discussions. As Jeffry Sachs argues in an article in *The Financial Times* (November 5, 1998), "G-7 declaration for all its advances still reflects a haughty disregard for the rest of the world. They are called upon to support the G-7 declaration, not to meet for joint problem-solving. That summit should be a dialogue for the rich and poor together, not just a community of the rich pretending to speak for the world. "Even with the best of leaderships, however, international monetary reform would be a slow process of analysis, evolution and consensus-building. There are entrenched structural problems and a brand new architecture of international reform is nowhere in sight. The most we can hope for is to recognise the urgent need to contain and regulate the predatory activities of financial buccaneers in the Wall Street marketplace. That would be some contribution towards restoring some semblance of sanity in the financial markets. The new barbarians have crossed the gate and are inside the arena. Will Wall Street and their regulators succeed in disciplining them?

The Indian Econometric Society

Announcement

35th Annual Conference of The Indian Econometric Society at Jaipur on March 11-13, 1999 hosted by the University of Jaipur.

The last date for submission of paper to the Conference is set as 30th January, 1999. Acceptance will be intimated before February 15, 1999. Please send three copies of the paper with abstract as follows.

1. ONE copy to Professor M.J. Manohar Rao, whose address is given below:

Professor M.J. Manohar Rao
Vice President, TIES
Department of Economics
University of Bombay
Kalina Campus
Mumbai - 400 098

Tele: 022-6183198/6171942
Fax No. 6116707

2. TWO copies to Professor V.R. Panchamukhi, whose address is given below:

Professor V.R. Panchamukhi
President, TIES
Care: RIS
Core IV-B, Fourth Floor
India Habitat Centre
Lodhi Road
New Delhi - 110 003

Tele: 011-4617136/4617403
Fax No. 4628068
E-mail: risnodec@del2.vsnl.net.in

You may please send the paper and the abstract in the form of a floppy to Dr V.R. Panchamukhi, since this would greatly facilitate the publication of the accepted papers (in Word Star/Word Perfect).

Please intimate about your travel plan, request for accommodation, etc, to the Local Organising Secretary in the following address:

Dr Narain Sinha
Head
Deptt. of Economics
University of Rajasthan
Jaipur 302 004
RESIDENCE:
83/III Jaijawan Colony
JLN Marg, Jaipur 302013

Tele: 0141-511071 (o)
553328 (r)
Fax No. 510880

We have to update the Addresses of the Members. All the members are requested to intimate to Dr V.R. Panchamukhi, President, TIES, their particulars in the following proforma:

Name & Address (Home and Office)
Telephone Number, Fax Number, E-mail
Field of Specialisation

All those interested in enrolling themselves as new members may write to the Secretary, TIES at the following address:

Professor T.M. Srinivasan
Secretary
The Indian Econometric Society
Deptt. of Economics
University of Madras
Chennai 600 005

Tele: 044-568778 (o)
2348367 (r)
Fax No. 8586513/8566693

We seek co-operation and support of all those interested in the quantitative analysis of economics.

(Dr V.R. Panchamukhi)
President

(Dr T.M. Srinivasan)
Secretary

(Dr Narain Sinha)
Local Organising Secretary

Financial Programming and Stabilisation Policy Options for Macro-Economic Adjustment

M J Manohar Rao

The paper initially discusses the real and monetary aspects of short-run structural adjustment using a flow-of-funds methodology. Based upon such a framework, it then specifies an analytical basis which is capable of integrating the financial programming model of the Fund with the financial requirements approach of the Bank in a manner which removes the existing dichotomies between the real and financial sectors of the economy. The merged model, which defines monetary, external, real and financial sector equilibrium, is then used to prescribe feasible stabilisation policy options for the Indian economy over the current fiscal year.

I
Interest in Structural Adjustment Programmes

THERE are several reasons for the current interest in macro-economic adjustment throughout the developing world. Macro-economic adjustment, which broadly comprises stabilisation and structural reform policies, is required whenever imbalances persist between aggregate domestic demand and aggregate domestic supply. This imbalance could be generated by exogenous shocks, such as economic sanctions or natural events. Disequilibria could also be generated due to distortions on account of unsustainable domestic policies However, as long as foreign resources are available, such a situation of excess demand can be sustained, albeit at severe economic costs, such as rising external debt, high inflation and stagnant growth. Eventually, however macro-economic adjustment, in terms of reducing absorption as well as improving the balance of payments (BOP) situation, would be needed in order to rectify the deteriorating situation.

However, reaching a sustainable BOP and simultaneously achieving high growth is proving to be more difficult than previously anticipated. Even in the once high performing east Asian economies, growth has been elusive despite implementation of moderate to intensive economic reforms. After over five years of 'shock therapy', several countries of eastern Europe, sub-Saharan Africa and Latin America have yet to show signs of satisfactory growth leading development economists to dub the 1980s as the 'lost decade'. Although, in response, adjustment programmes have widened their scope to include policy-based investment projects and sector adjustment programmes, Burki and Edwards (1996) note that what most countries essentially require are 'second generation reforms' aimed at modernising the state and reforming institutions, including moving towards independent central banks, the judiciary, regulatory bodies and budgetary processes. Some, if not most, of these aspects are part of the reform agenda of most developing countries.

Adjustment is thus now seen as an ongoing process with reforms impacting upon all aspects of economic life. Broader issues include not only sustainable development and poverty reduction but a major shift in the economic systems of the developing countries towards a market-friendly orientation. There is now a consensus that over-centralised planning and overt-protectionism are fundamentally wrong. While there has been no convergence of views on the efficacy of competitive markets in economic development, the debatable issues currently are not state versus market, or intervention versus laissez-faire, but the speed of reform, the complementarity between markets and governments and the appropriate transition to the correct macro-economic balance that would determine a less rocky road to reform and a more effective path of development.

II
Analytical Framework and the Use of Models

There are three reasons for specifying the analytical framework used in reform efforts. First, policy makers need to understand the main relationships between instruments and targets so as to make judgments as to where and how fast the economy is likely to move in the short to medium term. Second, models ensure the consistency of policy measures and provide a framework by means of which trade-offs can be coherently discussed. Third, there is a certain symbiosis between models and policy-making: in effect, the specification of models depends upon the policy-makers' statement of economic problems, preferences and priorities; and, in turn, policy-makers depend upon models to provide information regarding future scenarios. Thus, in the formulation of any structural adjustment programme, political processes and technical analysis are closely related, and to the extent that there is a certain amount of discipline involved in the overall design of an adjustment programme, economic policy-making generally draws upon economic models or frameworks implicitly or explicitly.

An integrated system of national accounts is necessary for the macro-economic appraisal of any economy. Such a framework of income and flow-of-funds accounts indicates the existence of various identities amongst the recorded magnitudes in the economy which can be useful in assessing the effects of policy changes. By themselves, however, these identities are an 'empty box' and need to be supplemented by relations that indicate the typical reactions of some of the variables included in the accounting framework to changes in other variables. These behavioral relationships can then be combined with the identities in order to form a schematic quantitative representation, or model, of economic processes involving the accounts, or variables, that define the economy in question. Such economic models provide the quantitative framework required for forecasting and policy prescription. They can be used in two distinct modes: first, the positive mode which assesses the consequences of assumed changes in the exogenous variables, determined independently of the processes illustrated in the model, and on the magnitudes of the endogenous variables which are determined within the model; and second, the programming mode which determines the changes in policy variables (instruments) required in order to achieve the desired changes in some of

the endogenous variables of the model considered to be the objectives (targets) of economic policy. Financial programming involves the use of models in this second mode because it attempts to determine the appropriate setting of the policy instruments against the backdrop of the economic situation and the desired outcomes.

However, it should be emphasised that economic models, being mathematical representations of economic theory, do not capture all the complexity of economic reality. They often possess the underpinnings of paradigms, which manifest themselves in differences in the underlying assumptions, specification of equations, direction of causality and manner in which the model is closed. While economic theory does provide guidelines as far as the first three aspects are concerned, there is nothing to fall back on as far as model closure, which is the specification of the binding constraint, is concerned except the features of the economy under consideration. For example, is the economy constrained by domestic savings, credit creation or availability of foreign exchange? Depending upon which constraint is binding, the model yields qualitatively different results. These pitfalls need to be fully grasped in the specification and design of any adjustment programme.

Objectives and Instruments

Not all structural adjustment programmes emphasise the same objectives although it is possible to discern a set of 'core objectives' including the achievement of external and internal balance as well as adequate economic growth. However, very often, the government pursues other objectives as well that may at times conflict. One well-known analysis [Musgrave 1959] classifies three functions of the government from an economic standpoint: in addition to the stabilisation function, there are also the functions of allocation and distribution. In such a context, the pursuit of allocational and distributional objectives may impede the adoption of stabilisation measures: for example, fiscal cuts may be postponed because the government is unwilling to reduce food subsidies reflecting its distributional priority; or it may be unwilling to eliminate credit controls reflecting its allocational priority.

Be that as it may, the problem of conflicting objectives is not confined only to the trade-offs that exist between the stabilisation, allocation and distribution objectives. For example, while it is accepted that price stability is a necessary condition for achieving adequate economic growth, in certain cases, the inflationary process seems to take a life of its own and it is very difficult, even with appropriate demand-management policies, to eliminate this 'inertial inflation' without inflicting a protracted period of stagnation upon the economy. In such a context, perhaps the greatest problem is forecasting the dynamics of policy efforts to reduce inflation. This is especially true of a gradualistic approach, where the results depend crucially on expectations generated by the credibility of government policies.

In most adjustment programmes, targets set for the objectives are open-ended, i e, they are regarded as floors or ceilings rather than as point targets, since it is perceived that there is no apparent cause for concern in over-performance. Nevertheless, this is not always true. For example, greater-than-targeted output growth, if not directed towards export orientation or import substitution, may conflict with the inflation target or result in a violation of the BOP constraint. Thus, once a targeted set of objectives has been achieved, it may be best to avoid over-performance, as there could be trade-offs amongst objectives. If, however, it is apparent that over-performance is inevitable, then it might be best to re-design the entire structural adjustment programme in order to align the revised targets appropriately.

In any model, intermediate targets link the ultimate objectives and the policy instruments. For example, the BOP could be an intermediate target linking reserve accumulation (ultimate objective) with the exchange rate (instrument). In some instances, these intermediate targets themselves are regarded as targets, and the ultimate objectives are not made explicit but are implied in the desired values of the intermediate targets. In such cases, a choice might need to be made between an intermediate target that is highly correlated with the ultimate target but bears little relationship with the policy instrument, and one which is strongly influenced by policy but has a weak association with the ultimate objective. Needless to say, the eventual choice of ultimate objectives, intermediate targets and policy instruments, apart from being constrained by the stage of development of economic institutions and the role of planning, would be largely dictated by the circumstances under which the adjustment programme is being formulated.

Considering the fact that the framework of most stabilisation and structural adjustment programmes is a blend of two extremely influential approaches to macroeconomic analysis, i e, the financial programming approach developed by the International Monetary Fund (IMF) and the financial requirements approach developed by the World Bank, it is essential to consider our analysis on broadly similar lines if one has to fully grasp the overall implications of any reform process. That money and monetary policy play key roles in determining BOP outcomes, and therefore clearly also in the design of adjustment programmes, does not necessarily make such adjustment programmes 'monetarist' in character. The concentration on monetary flows in such programmes can be justified on several grounds, ranging from the theoretical view that the BOP is essentially a monetary phenomenon to the more pragmatic reason that data on monetary variables contain important macroeconomic information and are relatively more accurate and timely than data on real variables.

By stressing on the theory underlying stabilisation policies, it is hoped that the paper will dispel the popular misconception that the approach to the design of structural adjustment is based on the particular view of the economy or, more importantly, on the convictions of any single school of thought. In this context, while most discussions on macro-economic stabilisation have assumed that fiscal austerity, competitive real exchange rates, sound financial markets and deregulation provide the conditions for a resumption of growth, Dornbusch (1981) has argued that there is a possibility of stabilisation resulting in stagnation because structural adjustment is only a necessary but not a sufficient condition for growth.

Needless to say, even if the current stabilisation policy that has been initiated in India does result in the resumption of growth, there is little assurance that such a resumption will not translate itself once more into rising current account deficits and the subsequent run on reserves as was witnessed during the late 1980s. These past trends in the Indian economy have raised several interesting, albeit unanswered, questions regarding the optimal mix of stabilisation policies that need to be pursued in order to avoid the possibility of such a recurrence.

As all these issues have not yet been fully recognised by orthodox economics, the paper discusses the real and monetary aspects of short-run structural adjustment using the flow-of-funds methodology. Based on such a framework, the paper sets out an analytical framework capable of integrating the financial programming model of the Fund with the two-gap model of the Bank in a more meaningful manner than has been hitherto attempted so as to remove

the existing dichotomies between the real and the financial sectors of the economy.

The policy issues, then, that will have to be studied within the Indian context need to be related to the following questions: (1) What are the essential steps to ensure monetary stabilisation? and (2) What policy co-ordination measures are necessary to ensure sustainable growth without rising inflation or increasing current account deficits? In such a context, any design of policy for the Indian economy will have to evaluate the following three elements in order to decide which of these are most likely to play a central role in the long-run success of a stabilisation effort measured in terms of a rapid smooth transition to growth. These are: (1) the desired levels of inflation and international reserves, (2) the optimal levels of domestic credit and the exchange rate, and (3) the appropriate levels of capital flows.

III
Elements of a Macro-Economic Accounting Framework

As mentioned earlier, this section initially discusses the elements of a macro-economic accounting framework. The framework is based on five accounts corresponding roughly to the macro-economic identities which link together: (1) the national accounts, (2) the government sector, (3) the non-financial private sector, (4) the balance of payments sector, and (5) the monetary system. These would be the minimum elements of a consistency framework.

The government sector includes all levels of government (central, state, district and local) as well as public corporations funded through the government budget. The non-government (private) sector is simply a grouping of households as well as the private corporate sector. Thus, it is an aggregation over all households, all non-government owned enterprises, self-employed people, etc. The monetary system identified in the consistency matrix includes the entire banking system (including the central bank) and other public savings institutions. These financial institutions play a key role as middlemen for transactions involving the acquisition of assets and liabilities. The central bank issues currencies and often holds the international reserves of a country, which are determined by its BOP situation. It is only because we are interested in the role of the monetary system as an intermediary for channeling savings from one group of transactors to another does such an aggregation become relevant. However, any study that, among other things, is concerned with how the activities of the central bank affect money supply through commercial banking regulations, such as cash-reserve ratios, statutory liquidity ratios, bank rates, and so on, would require further disaggregation.

The accounts can be presented in two ways. One can either present them as individual accounts or integrate them through a matrix of income, expenditure, saving, and asset and liability accumulation. Although the individual accounts give a comprehensive presentation of the flows in a consistent framework, it is helpful to integrate the accounts so that they are mutually consistent. For this, a useful device is a matrix of sources and uses for the four sectors plus the national accounts. The matrix can be seen as a combination of a flow-of-funds (FOF) matrix and a social accounting matrix (SAM). The FOF methodology emphasises the equality of sources and uses of funds, distinguished between the current and capital accounts, while the SAM approach presents the standard macro-economic identities (savings-investment and income-expenditure) in a form that shows the participation of each economic sector in the economy. The SAM was traditionally used for analysis of the real economy, as in general equilibrium models, and thus covered only real variables. However, it has recently been extended to cover real and financial interactions as well [Easterly 1989].

The matrix [Rao and Nallari 1996] has the advantage that it captures the essence of both the SAM and FOF approaches. The matrix, which is presented in Table 1, has the appealing feature that the row sums must be equal to the sum of the corresponding columns. This allows us to verify that the accounts are consistent. Like the SAM, it also presents the main macro-economic identities in a transparent way. Thus, the first row is the conventional GDP identity from the expenditure side, while the first column is the GDP identity from the income side. The tenth row and tenth column provides the savings-investment identity. As in the FOF approach, the matrix stresses the identity of sources and uses, distinguished between the current and capital accounts.

The upper left hand 5 x 5 corner of the matrix presents the current account transactions of each of the five sectors. The remainder of the matrix records the capital account transactions for each sector. The connecting link between the two is the saving of each sector, shown as a 5 x 5 matrix in the lower left-hand side of the overall matrix. Thus, the first part of the matrix records the identity of current sources and uses, where the latter includes savings. The second part of the matrix, i e, the lower half and the right half and their intersection, shows the financing identity of each sector, with their borrowing shown across the row and their asset accumulation down the column. This is the identity of capital sources and uses, with savings again as the balancing item.

Since the row sums must equal column sums in this matrix, this implies that investment plus financial asset accumulation must equal savings plus financial liability accumulation. This is another form of the familiar identity which states that saving minus investment equals *net* financial asset accumulation for each sector.

Current Account

Table 1 presents the transactions of an economy in the form of a consistency matrix. The first row and the first column (the national accounts) depict the production account of the economy. As presented, the national accounts group the activities of all producing units together. Thus, they include the production of all incorporated enterprises (including financial institutions), unincorporated enterprises, producers of government services, and production by households, regardless of the type of good or service produced.

Across row 1, the table describes how goods and services that are currently produced domestically (Y) or imported (Z) in the current production period are used for government consumption (C_g), private consumption (C_p), exports (X), and gross investment of the government and private sectors (I_g and I_p); that is, the acquisition of physical assets as distinct from the acquisition of financial instruments. This describes the expenditure approach to the estimation of GDP. The value added approach to the estimation of GDP is adopted in column 1 wherein the value at market prices of current domestic production is broken up by identifying the types of incomes that are generated through the sale (plus own consumption) of domestic production. These incomes are in the form of: (i) net operating surplus of the public sector (OS_g); (ii) depreciation of capital engaged in public sector's production (D_g); (iii) net indirect taxes, i e, indirect taxes (Ti) less subsidies (Sb); (iv) wages and net profits of the private sector; and (v) depreciation of capital engaged in private sector's production (D_p). The sum of (i), (ii) and (iii) mentioned above yields Ymp_g, i e, the share of the government sector in GDP at current market

Table 1: Consistency Accounting Matrix

Sources (Across) and Uses (Down)	Current Account of (C1) National Accounts	(C2) Government Sector	(C3) Private Sector Sector	(C4) External Sector	(C5) Monetary Sector	(C6) Government Sector	(C7) Private Sector	Capital Account of (C8) External Sector	(C9) Monetary Sector	(C10) Total Investment	Total
National accounts (R1)		Government consumption (C_g)	Private consumption (C_p)	Exports of goods and services (X)		Gross government investment (I_g) or (δK_g)	Gross private investment			Total investment (Gross) (I) or (δK)	GDP at market prices plus imports (Y+Z) = $C_g + C_p + X + I_g + I_p + Z$
Government Sector (R2)	Net operating surplus of G plus Dep_g plus Indirect taxes less subs [OSg + D_g + (Ti-Sb)]		Direct taxes (Td)	Net transfers from E to G (NTR_{eg})							Total government revenue = $(Y_g) = OS_g + D_g + (Ti - Sb) + Td + NTR_{eg}$
Private sector (R3)	Wages plus net profit accruing to P plus Dep_p $[(w + \pi) + D_p]$	Net G transfers to P and interest on dom debt $(NTR_{gp} + INT_g)$		Net transfers and factor payments from E to P $(NTR_{ep} + NFP_{ep})$							Total private sector income $(Yp) = (w + \pi) + Dp + NTR_{gp} + NTR_{ep} + NFP_{ep}$
External sector (R4)	Imports of goods and services (Z)	Inv inc of E from G including interest payment (INV_{ge})	Inv inc of E from P including interest payment (INV_{pe})								Current expenditure or payments (Abroad) = $INV_{ge} + INV_{pe} + Z$
Monetary sector (R5)											
Savings and Borrowings of Government sector (R6)		Gross government savings (S_g)					Net change in G borrowings from P (δNDB_g)	Net change in foreign borrowings of G (δNFB_g)	Change in domestic credit to G (δDC_g)		Government savings plus δ govt borrowings $= S_g + \delta DC_g$ $\delta NDB_g + \delta NFB_g$
Private sector (R7)			Gross private savings (S_p)					Net change in E borrowing of P (δNFB_p)	Change in dom credit to P (δDC_p)		Pvt savings plus δ pvt borrowings $= S_p + \delta DC_p + \delta NFB_p$
External sector (R8)				E savings or CAD of the domstic economy					Change in foreign exchange reserves (δR)		External savings plus δ reserves = CAD + δR
Monetary sector (R9)							Change in broad money plus other liabilities (δM)				δ Domestic liabilities of the monetary sector = δM
Total savings (sum of 4 rows) (R10)		Gross government savings (S_g)	Gross private savings (S_p)	Current account deficit (CAD)							Domestic plus foreign savings $= S_g + S_p + CAD$
Total	GDP at market prices + imports (Y) + Z = OSg + Dg + (Ti-Sb) + $(w + \pi)$ + Dp = Z	Total government current uses = CEXPg + Sg = Cg + $NTR_{gp} + INT_{gp}$	Total private current uses = $CEXP_p + S_p$ = CP + Td + $INV_{pe} + S_p$	Toral current foreign exg recepts = X + NTR_{eg} + NTR_{ep} + CAD		Government investment $= I_g$	δ Assets of private sector $= I_p + \delta NDB_g$ $= \delta M$	δ in foreign borrowings = (δNFB) = $(\delta NFB_g + \delta NFB_p)$	δ Assets of monetary system = $(\delta DC_g + \delta DC_p + \delta R)$	Total investment (I or δK) = $I_g + I_p$	

Note: (1) G, P and E refer to government sector, private sector and external sector sector respectively. (2) The 'δ' preceding any variable indicates one period change in that variable, ie, $\delta DC = DC - DC(-1)$.

prices; and that of (iv) and (v) yields Ymp_p, i e, the share of the private sector.

Row 2 and column 2 of Table 1 depict the current transactions of the government. Across row 2 the sources of government income (Y_g) are identified. These are: (i) gross income accruing to the government from GDP at factor cost at current prices (Ymp_g); (ii) direct taxes (Td) which comprise corporate taxes (Td_c), direct taxes as paid by households (Td_h) and miscellaneous receipts of government administrative departments (MR); and (iii) net official transfers that the government receives from external sources (NTR_{eg}). Column 2 describes current government expenditures ($CEXP_g$) as the sum of: (i) government consumption of currently produced goods and services (C_g), which is the cost of providing government services, (ii) net payments from the government to the private sector (NPgp), which includes net transfers to domestic households (NTR_{gp}) and interest paid to households on domestic debt (INT_{gp}), and (iii) net investment income accruing to the external sector from the government (INV_{ge}) of which the interest that the government pays on its external debt (INT_{ge}) forms a major component. Government savings (S_g) -- at the intersection of row 6 and column 2 -- is the difference between government income (Y_g) and expenditure ($CEXP_g$).

Row 3 and column 3 describe the accounts of the non-government (private) sector. Across the row the sources of income of private households (Y_p) are identified as: (i) gross income accruing to the private sector from GDP at factor cost current prices (Ympp) (ii) net payments received by the private sector from the government (NP_{gp}), and (iii) net external receipts of the private sector (NERep) comprising net transfers payments from the external to the private sector (NTR_{ep}) plus net factor payments from abroad (NFP_{ep}). Column 3 describes the disposal of private sector income as the sum of (i) private consumption (C_p), (ii) payment of direct taxes (Td), and (iii) net investment income accruing to the external sector from the private sector (INV_{pe}) of which the interest that the private sector pays on its external borrowings (INT_{pe}) forms a major component. Private savings (S_p), appearing at the intersection of row 7 and column 3, is the item that balances the current expenditures of households ($CEXP_p$) and household (private sector's) income (Y_p).

Row 4 and column 4 depict the current account balance. Entries in row 4 show the sources of income accruing to foreign residents. These include (i) net investment incomes accruing to the external sector from the government sector (INV_{ge}) and the private sector (INV_{pe}), and (ii) the proceeds of the domestic economy's imports of goods and services (Z). Payments of principal on the external debt (amortisation) are recorded in the capital finance accounts, i e, 'below the line' (see rows and columns 6 through 9), and are thus not included in the current account. Column 4 indicates that foreign residents, in turn, purchase the exports of the economy (X) and make transfers (current as opposed to capital transfers) to the government (NTR_{eg}), as well as make transfers and net factor payments to the private sector ($NTR_{ep} + NFP_{ep} = NER_{ep}$). The savings of foreign residents in their dealings with the economy -- identical to the current account deficit of the domestic economy (CAD) -- is the balancing item between current external expenditures and foreign exchange receipts.

As a pure intermediary, the monetary system has no independent (own account) current revenues and expenditures. As previously pointed out, the revenues of financial institutions (service charges, interest on loans, and earnings on investment made with deposits or premiums) less the costs (interest on deposits or claims paid) constitute the value added of institutions within the monetary system as producing units. This value added is included in the production account of the domestic economy as income to households or to the government. Row 5 and column 5 are therefore empty.

Capital Account

While rows and columns 1 through 5 describe the current accounts of the economy, rows and columns 6 through 9 describe the corresponding capital account transactions, i e, the financing of asset acquisition by the government, the private sector and the external sector through the intermediary of the monetary system.

In row 6 gross savings of the government (S_g) and new borrowings from the monetary system (δDC_g), net direct borrowing from the private sector (δNDB_g), and foreign borrowing (δNFB_g) are used to finance asset acquisition by the government, i e, gross public sector investment (I_g). Public sector investment is of three forms: gross fixed investment (including physical assets, inventories and working capital, as well as intangible non-financial assets); investment in financial assets in the form of loans to the private sector; and the acquisition of foreign assets. The last two items have been netted out of government borrowings from the private sector and foreign borrowings of the government, respectively, and therefore these items do not appear as separate entries in the matrix.

Row 7 and column 7 deal with the private sector. Gross private sector savings (S_p), borrowings by the household from the monetary system (δDC_p), and net new private borrowings from foreign residents (δNFB_p) are used to finance gross private sector investment (I_p), net lending to the government (δNDB_g), and holdings of new issues of domestic currency, demand as well as time deposits issued by the monetary system (δM).

Similarly, in row 8 and column 8, the savings of foreign residents or the current account deficit of the domestic economy (CAD) plus the proceeds from the acquisition of new foreign assets (accumulation of international reserves) by the monetary system (δR) are used to finance the net foreign borrowings of the government (δNFB_g) as well as the private sector' (δNFB_p).

Row 9 and column 9 deal with the monetary system. As an intermediary it acquires liabilities in the form of new domestic currency issues, demand deposits, time deposits, and other liabilities such as treasury bills, and so on (δM). It, in turn, acquires assets in the form of loans to the government and the private sectors (δDC_g and δDC_p), and net foreign assets or international reserves (δR).

Row 10 and column 10 deal with the savings-investment link at the macroeconomic level and indicate that domestic savings, i e, the sum of government savings (S_g) and private savings (S_p), plus foreign savings (CAD) must finance total investment, i e, the sum of government investment (I_g) and private investment (I_p).

In effect, therefore, Table 1 summarises the current and capital account transactions of the four principal transactors in an economy, and can be used to demonstrate that the national income identities are no more than a series of budget constraints.

IV
Flow-of-Funds versus Market Equilibrium

The link between savings and investment of each sector and its associated financial transactions with the other sectors must be clearly understood so that appropriate financial policies, based on reliable and consistent macro-economic forecasts, can be formulated and executed. In this context, flow-of-funds accounts are essential prerequisites for the formulation of any

financial programme as they form the basis for ensuring consistency

The procedure in formulating a financial programme is therefore to construct flow-of-funds matrices for each year so that the pattern of financial transactions is discernible Based upon such patterns, it is usually possible to fill in the elements of the flow-of-funds matrix for a future period, consistent with each sector's savings and investment behaviour, and the monetary and fiscal policies likely to be in force Since the flow-of-funds matrix also depends on financial conditions which can be influenced by financial policies and which interact with the behaviour of income and expenditure flows, the construction of such a consistency matrix often involves an iterative procedure until overall consistency is achieved

In Tables 2 1 and 2 2, we have projected the flow-of-funds matrices for the Indian economy for 1996-97 and 1997 98 using the latest available data All estimates in

these tables are at rupees crore at current prices. Based upon these projections, we will attempt to identify changes, if any, in financial patterns which could be considered responsible for the economic slowdown in 1997-98.

In both the tables, reading across rows provides the sources of finance for each sector while reading down columns indicates the uses of finance. *Ex-post*, each sector's deficit must be financed and, as such, the sum of the rows is always equal to the sum of the columns. *Ex-ante*, these sectoral balances become constraints for modelling sectoral behaviour, be it financial or non-financial. It is these constraints that will be included while specifying the financial programming model that follows.

The fundamental difference between the flow-of-funds and the market equilibrium approaches while formulating a model is that sectoral balances are treated as constraints in the former while the latter treats market equilibria as constraints. In the case where market forces and instantaneous adjustments co-exist, these two types of constraints are equivalent since when all sectoral accounts are balanced, all markets must be cleared. However, any market imperfections and lag adjustments would create a situation where sectoral balances are not equivalent to market equilibria. For instance, when credit rationing is in force, the money market cannot be in equilibrium by definition. The resulting disequilibrium in the money market must co-exist with the disequilibrium in at least one other market in the economy. In such cases, sectoral balances yield more reliable constraints.

Financial Patterns

Based upon the flow-of-funds matrices presented in Tables 2.1 and 2.2, as well as the supplementary information on GDP at current market prices (Y), the growth rate of real GDP (g), the inflation rate (π), and the exchange rate depreciation (e), the following patterns emerge:

(1) An event which had a profound influence on the pattern of financial transactions in 1997-98 was the sudden fall (***even in absolute terms***) in net transfers from the external sector to, both, the government sector (NTReg) as well as the private sector (NTRep) which decreased from 3.5 per cent of GDP in 1996-97 to 3.0 per cent in 1997-98.

(2) With tax receipts (Td) covering barely 50 per cent of net payments by the government to the private sector (NPgp) in 1997-98, and with government consumption (Cg) increasing from 60 per cent of total government revenue (Tg) in 1996-97 to 63 per cent in 1997-98, public sector savings (Sg) decreased to 1.8 per cent of GDP in 1997-98 from 1.9 per cent in 1996-97.

(3) Although there was an across-the-board reduction in direct tax rates in 1997-98, total direct tax revenue (Td) as a fraction of GDP actually increased from 3.66 per cent in 1996-97 to 3.82 per cent in 1997-98, definitely as a result of a wider tax base and probably (if the 'Laffer curve' hypothesis is to be accepted) because of better tax compliance.

(4) Consequently, private disposable income (Yp-Td) decreased from 86.3 per cent of GDP in 1996-97 to 85.0 per cent in 1997-98; while private savings decreased from 28.1 per cent of private disposable income in 1996-97 to 27.2 per cent in 1997-98.

(5) Despite this fall in the savings rate, there was no perceptible increase in private consumption (Cg) which remained stagnant at about 72 per cent of private disposable income in 1997-98. The question then arises as to where private disposable income was being 'disposed' off.

(6) In this context, it needs to be noted that 1997-98 was marked by a sudden increase in interest payments by the private sector on account of its external liabilities (INVpe) which amounted to almost Rs 11,000 crore (which was 1 per cent of private disposable income). While we are still conjecturing at this stage as to what could be the reason(s) for the downturn in demand which has characterised the best part of last year and this year as well, it is possible that this massive outflow of private sector resources (which could otherwise have been used to augment its consumption plans) is one of the prime reasons.

(7) Despite the fact that the exchange rate depreciated by more than 10 per cent (on a point-to-point basis) in 1997-98, the current account deficit (CAD) worsened further from 1.2 per cent of GDP in 1996-97 to 1.7 per cent in 1997-98 which could be an indication that the economy is still operating on the envelope of shifting 'J-curves'. In such a case, the further depreciation of the rupee in 1998-99 would continue to mask improvements in the CAD.

(8) While capital flows as a proportion of the CAD (δNFB/CAD) was almost 2.1 in 1996-97, it decreased sharply to 1.5 in 1997-98, partly as a fallout of the south-east Asian economic meltdown. As a result, reserve accretion (ΔR) was much lower in 1997-98.

(9) In an effort to pre-empt the economic downturn, the RBI decided to stimulate the economy via a strong burst in domestic credit expansion (ΔDC) which increased from 4.9 per cent of GDP in 1996-97 to 6.5 per cent in 1997-98. Consequently, monetary growth was of the order of 17.6 per cent in 1997-98 as against 16.2 per cent in 1996-97.

(10) Despite this increase in money supply and despite the fall in the real growth rate from 7.5 per cent in 1996-97 to 5.1 in 1997-98, the fact that the inflation rate was only 4.8 per cent in 1997-98 as against 6.4 per cent in 1996-97 is a mute testimony to the sheer extent of depressed demand which persisted in the economy.

(11) The direct beneficiary of the credit expansion was the private sector whose 'entitlement' ($\Delta DC_p/\Delta DC$) increased from 50.5 per cent in 1996-97 to 57.5 per cent in 1997-98. With limited scope for money financing of the fiscal deficit, the government was thus forced to meet a large part of its needs from the market. Thus market borrowings (ΔNDB_g) increased from 4.0 per cent of GDP in 1996-97 to 4.8 per cent in 1997-98.

(12) Consequently, the ratio of financial asset creation (ΔNDBg + ΔM) to GDP increased from 10.2 per cent in 1996-97 to 12.2 per cent in 1997-98; while the ratio of self-financed private investment (Ip/Sp) decreased from 77.4 per cent in 1996-97 to about 73.6 per cent in 1997-98.

(13) Such a pattern of money-financing (ΔM) and debt-financing (ΔNDB_g) to cover fiscal deficits implied that the distribution of private sector asset formation was skewed much more towards financial (non-productive) rather than physical (productive) assets. Thus, while in 1996-97, the ratio of financial asset creation ($\Delta NDB_g + \Delta M$) to physical asset creation (I_p) in the private sector was about 35:65, this ratio changed adversely to 42:58 in 1997-98 signalling a crowding-out of private sector physical investment. This could also be a reason as to why growth decreased so substantially in 1997-98.

V
Growth-Oriented Financial Programming: A Conceptual Framework

Based upon the key elements of the consistency accounting framework discussed above, we now specify a growth-oriented financial programming model. Nominal income (Y) is equal to Py where P is the domestic price level and y is real output. The money market is assumed to be in equilibrium, implying that real money stock (M/P) equals real money demand (Md/P) which is assumed to be a function of real income and the nominal interest

rate (i). The velocity of money (v) is assumed to be equal to real output divided by real money demand. Nominal money supply (M) is related to nominal income with the velocity of money being given endogenously. Nominal money supply is given as the sum of domestic credit (DC) and foreign exchange reserves (R). The change in reserves (ΔR) equals the sum of the trade balance (X–Z) and other capital flows (ΔF). Investment (I) is the sum of domestic savings (S) and foreign savings, the latter being synonymous with the current account deficit (Z–X). Real output is a function of real investment (I/P) with the incremental output-capital ratio (k) assumed to be a constant.

Therefore, the theoretical model is given by the following 8 equations:

$$Y = Py \qquad (5.1)$$

$$M/P = Md/P = Ay^{\alpha}e^{-i\beta} \qquad (5.2)$$

$$v = y/(Md/P) \qquad (5.3)$$

$$Mv = Y \qquad (5.4)$$

$$M = DC + R \qquad (5.5)$$

$$\Delta R = (X - Z) + \Delta F \qquad (5.6)$$

$$I = S + (Z - X) \qquad (5.7)$$

$$\Delta y = k[I/P] \qquad (5.8)$$

The above model will now be compressed into a 4-equation core, explaining growth, inflation, reserves and the interest rate by incorporating important modifications in the model

Monetary Sector Equilibrium

Substituting eq (5.4) into eq (5.5), taking first-differences, and using eq (5.1) – which indicates that $\Delta Y = (g + \pi)\, Y(-1)$ – yields the following equation for monetary sector equilibrium:

$$\Delta R = (1/v)\,(g+\pi)\,Y(-1) - \Delta DC \qquad (5.9)$$

where g is the real growth rate, i e, $g = \Delta y/y(-1)$; π is the inflation rate, i e, $\pi = \Delta P/P(-1)$; and Y(-1) is the lagged value of nominal income. The income velocity of money (v) is provided exogenously in the above formulation by specifying that the income elasticity of real money demand is equal to unity ($\alpha = 1$) in eq (5.2). This implies that:

$$v = 1/Ae^{-i\beta} \qquad (5.10)$$

In order to measure foreign exchange reserves in terms of foreign currency units, eq (5.9) above has to be changed to reflect the valuation effects of exchange rate changes on the balance sheet of the banking system. The stock of foreign exchange reserves in domestic currency units (R) is equal to the nominal exchange rate (E) times the stock of foreign exchange reserves in foreign currency units (R*), i e,

$$R = ER^* \qquad (5.11)$$

Therefore, changes in the domestic value of foreign exchange reserves may arise either due to changes in the exchange rate, changes in the stock of foreign exchange reserves in foreign currency units, or both. Therefore:

$$\Delta R = E(-1)\Delta R^* + R^*(-1)\Delta E \qquad (5.12)$$

which is obtained by ignoring the second-order interaction term, $\Delta E \Delta R^*$.

Substituting eq (5.12) into eq (5.9) and solving the resulting expression for ΔR^* yields after simplification:

$$\Delta R^* = (1/v)\,Y^*(-1)\,\pi + (1/v)Y^*(-1)\,g - [1/E(-1)]\Delta DC - R^*(-1)e \qquad (5.13)$$

where $Y^*(-1) = Y(-1)/E(-1)$, i e, nominal income in the previous period expressed in terms of foreign currency units, and $e = \Delta E/E(-1)$, i e, the rate of change of the exchange rate.

Eq (5.13) can be re-written as follows:

$$\Delta R^* - \alpha(1)\pi - \alpha(2)\,g = -\alpha(3)\,\Delta DC - \alpha(4)\,e \qquad (5.14)$$

where

$$\alpha(1) = \alpha(2) = (1/v)Y^*(-1) \qquad (5.15a)$$

$$\alpha(3) = 1/E(-1) \qquad (5.15b)$$

$$\alpha(4) = R^*(-1) \qquad (5.15c)$$

External Sector Equilibrium

Exports in domestic currency units (X) is equal to the nominal exchange rate (E) times the value of exports in foreign currency units (X*), i e,

$$X = EX^* = [E(-1) + \Delta E]X^* \qquad (5.16)$$

In a similar fashion, the change in the domestic value of foreign borrowings is given by:

$$\Delta F = E(-1)\Delta F^* + F^*(-1)\Delta E \qquad (5.17)$$

Imports in domestic currency units (Z) is equal to the nominal exchange rate (E) times the value of imports in foreign currency units (Z*), i e, $Z = EZ^*$. The latter, in turn, is equal to the foreign price level (P_f) times the volume of imports (QZ), i e, $Z^* = P_f\,(QZ)$. The import volume equation is given by:

$$QZ = Ay^{m}(EP_f\,/P)^{-b} \qquad (5.18)$$

where m and b are positive parameters that measure the elasticity of the volume of imports to real output and to the relative price of importables, respectively. Therefore, we have:

$$Z = Ay^{m}E^{(1-b)}P^{b}P_f^{(1-b)} \qquad (5.19)$$

Logarithmic differentiation of eq (5.19) with respect to time and its subsequent discrete-time representation yields:

$$Z = [1 + mg + (1-b)\,e + b\,\pi + (1-b)\,\pi_f]\,Z(-1) \qquad (5.20)$$

where g is the growth rate of real output (y), e is the rate of change of the nominal exchange rate (E), π is the domestic inflation rate, and π_f is the foreign inflation rate.

Substituting eqs (5.12), (5.16), (5.17) and (5.20) into eq (5.6) and solving the resulting expression for ΔR^* yields after simplification:

$$\Delta R^* = -bZ^*(-1)\,\pi - mZ^*(-1)\,g + [F^*(-1) + X^* - (1-b)Z^*(-1) - R^*(-1)]\,e + \Delta F^* + [X^* - Z^*(-1) - (1-b)Z^*(-1)\pi_f] \qquad (5.21)$$

Eq (5.21) can be re-written as follows:

$$\Delta R^* + \beta(1)\,\pi + \beta(2)\,g = \beta(3)\,e + \Delta F^* + \beta(4) \qquad (5.22)$$

where

$$\beta(1) = bZ^*(-1) \qquad (5.23a)$$

$$\beta(2) = mZ^*(-1) \qquad (5.23b)$$

$$\beta(3) = [F^*(-1) + X^* - (1-b)Z^*(-1) - R^*(-1)] \qquad (5.23c)$$

$$\beta(4) = [X^* - Z^*(-1) - (1-b)Z^*(-1)\pi_f] \qquad (5.23d)$$

Real Sector Equilibrium

We now assume that real output (y) is determined by a Harrod-Domar type growth equation given by:

$$y = (1-d)y(-1) + k(I/P) \qquad (5.24)$$

where k is the incremental output-capital ratio, d is the fraction of capital stock depreciated each period, and (I/P) is real investment, i e, nominal investment (I) divided by the price level (P).

In terms of the growth rate (g), eq (5.24) can be written as:

$$g = k\,\frac{(I/P)}{y(-1)} - d \qquad (5.25)$$

We now replace y(-1) by Y(-1)/P(-1) which is its definitional equivalent, and then replace P(-1)/P by $1/(1+\pi)$ which follows from the definition of the inflation rate, i e, $\pi = [P/P(-1)] - 1$.

Eq (5.25) can then be written as:

$$g = k\,\frac{[I/Y(-1)]}{(1 + \pi)} - d \qquad (5.26)$$

It is now assumed that nominal savings (S) are a linear function of nominal income (Y) and the nominal interest rate (i). Therefore, we have:

$$S = sY + \iota\, i \qquad (5.27)$$

where s is the marginal propensity to save, and ι measures the responsiveness of savings to the interest rate.

Taking first-differences of eq (5.27), writing it in terms of S, and using eq (5.1) yields:

$$S = S(-1) + s(g+\pi)Y(-1) + \iota\,\Delta i \qquad (5.28)$$

Substituting eq (5.6) into eq (5.7) yields:

$$I = S + \Delta F - \Delta R \qquad (5.29)$$

Substituting eq (5.28) into eq (5.29) above yields the following relationship between investment, growth, inflation, interest rates and reserves:

$$I = S(-1) + s(g+\pi)\, Y(-1) + \iota\Delta i + \Delta F - \Delta R \qquad (5.30)$$

Replacing ΔF and ΔR by their current representations which are given by eqs (5.17) and (5.12), respectively, yields:

$$\begin{aligned} I = {} & S(-1) + s(g+\pi)\, Y(-1) + \iota\Delta i \\ & + E(-1)\Delta F^* + F^*(-1)\Delta E \\ & - E(-1)\Delta R^* - R^*(-1)\Delta E \qquad (5.31) \end{aligned}$$

The growth equation, eq (5.26), when simplified by setting $\pi g = 0$, yields:

$$g = k[I/Y(-1)] - d(1+\pi) \qquad (5.32)$$

Substituting eq (5.31) into eq (5.32) above yields:

$$\begin{aligned} g = {} & ks(-1) + ks(g+\pi) + k[(^*/Y^*(-1)]\Delta i \\ & + k[1/Y^*(-1)]\Delta F^* + k[F^*(-1)/Y^*(-1)]\, e \\ & - k[1/Y^*(-1)]\Delta R^* - k[R^*(-1)/Y^*(-1)]\, e \\ & - d - d\pi \qquad (5.33) \end{aligned}$$

where $\iota^* = \iota / E(-1)$. This can be written as:

$$\begin{aligned} & \gamma(1)\Delta R^* + \gamma(2)\pi + \gamma(3)g - \gamma(7)i \\ & \quad = -\gamma(8)i(-1) + \gamma(4)e + \gamma(5)\Delta F^* \\ & \qquad + \gamma(6) \qquad (5.34) \end{aligned}$$

$$\begin{aligned} \text{where} \quad & \gamma(1) = \gamma(5) = k/Y^*(-1) \qquad (5.35a) \\ & \gamma(2) = d - sk \qquad (5.35b) \\ & \gamma(3) = 1 - sk \qquad (5.35c) \\ & \gamma(4) = k[F^*(-1) - R^*(-1)]/Y^*(-1) \qquad (5.35d) \\ & \gamma(6) = ks(-1) - d \qquad (5.35e) \\ & \gamma(7) = \gamma(8) = k[\iota^*/Y^*(-1)] \qquad (5.35f) \end{aligned}$$

Financial Sector Equilibrium

Once the process of financial liberalisation gets under way, policy-makers are faced with quite a different set of issues because the focus of attention shifts away from investigating the effects of freeing interest rates to examining how interest rates ought in fact to be determined. It is obvious that the process of determination of interest rates will be significantly different under alternative degrees of openness of the capital account of the BOP. For example, in the case of countries with a fully open capital account, some form of interest arbitrage will hold, with domestic interest rates depending on world interest rates, expected devaluation, and perhaps some risk factors. In contrast, in countries with a completely closed economy, open economy factors will obviously play no role whatsoever, and the nominal interest rate will depend only upon expected inflation and the prevailing conditions in the domestic money market. Most developing countries, however, do not fall in either of these two categories, so that interest rates will in general depend both on domestic as well as on foreign money market conditions. From a policy perspective, it is important to determine the way in which these different factors actually affect domestic interest rates, because the success of any growth-oriented adjustment programme depends critically upon an appropriate interest rate policy.

In this context, Edwards and Khan (1985) proposed a framework for empirically analysing the determination of nominal interest rates in developing countries. Their model combines features of both closed- and open-economy characteristics and specifically examines the respective influences of domestic monetary conditions and foreign factors on interest rates. The ensuing discussion is carried out with special reference to their framework.

Interest rates in a closed economy: Following the standard Fisher approach and ignoring the effects of taxation on the relation between expected inflation and the nominal interest rate [Darby 1975, Tanzi 1975], we can specify the nominal interest rate (i) as equal to:

$$i = r + \pi^e \qquad (5.36)$$

where r is the real (*ex-ante*) rate of interest; and π^e is the expected rate of inflation.

The real rate of interest can be specified as:

$$r = \rho - \lambda EMS + \omega \qquad (5.37)$$

where ρ is a constant representing the long-run equilibrium real rate of interest; EMS represents the excess supply of money; λ is a parameter ($\lambda > 0$) and ω is a random error term. According to eq (5.37), the real rate of interest deviates from its long-run equilibrium level ρ only if there is a monetary disequilibrium in the form of an excess demand for or supply of real money balances. This relation has been termed as the 'liquidity effect' in the literature [Mundell 1963]. Introducing this liquidity effect into the model allows the real rate of interest to be variable in the short run. As such, even though the Fisher equation, eq (5.36) is assumed to hold continuously, the possibility of slow adjustment of the real interest rate (given by λ) implicitly allows for the possibility of a delayed response of the nominal interest rate to monetary reform.

The excess supply of money by:

$$EMS = \ln m - \ln m^d \qquad (5.38)$$

where m (= M/P) is the actual money stock, and m^d is the desired equilibrium stock.

The long-run equilibrium demand for money is assumed to be a function of the expected rate of inflation (π^e), the equilibrium nominal rate of interest ($\rho + \pi^e$) – rather than the current nominal interest rate (i) – and real income (y). It is therefore given by:

$$\ln m^d = \alpha(0) + \alpha(1) \ln y - \alpha(2)[\rho + \pi^e] - \alpha(3)\pi^e \qquad (5.39)$$

The model is then closed by assuming that the stock of real money balances adjusts according to:

$$\Delta \ln m = \beta\, [\ln m^d - \ln m(-1)] \qquad (5.40)$$

where $\Delta \ln m = \ln m - \ln m(-1)$; and β $(0 \le \beta \le 1)$ is the coefficient of adjustment.

Substituting eq (5.40) into eq (5.38) yields:

$$EMS = (1-\beta)\, [\ln m(-1) - \ln m^d] \qquad (5.41)$$

Interest rates in an open economy: If the economy is completely open to the rest of the world and there are no impediments to capital flows, domestic and foreign interest rates will be closely linked. In particular, if there are no transaction costs and all agents are assumed to be risk-neutral, then the following uncovered interest arbitrage relationship will hold:

$$i = i_f + e^e \qquad (5.42)$$

where i_f is the world interest rate (for a financial asset of similar characteristics), and e^e is the expected rate of change of the exchange rate, i e, $e^e = \Delta e^e / e(-1)$.

If we assume that, because of frictions arising from transactions costs and information lags, domestic interest rates respond with delay to changes in the foreign rate of interest or in exchange rate expectations, then eq (5.42) can be re-written in a partial adjustment framework as follows:

$$\Delta i = \theta\, [\{i_f + e^e\} - i(-1)] \qquad (5.43)$$

where θ is the adjustment parameter, $0 \le \theta \le 1$. If the domestic financial market adjusts rapidly, the parameter θ will tend towards unity. Conversely, a small value of θ would imply slow adjustment of the domestic interest rate. In terms of the domestic interest rate, eq (5.43) can be written as:

$$i = \theta\, [i_f + e^e] + (1-\theta)\, i(-1) \qquad (5.44)$$

The general case: Having examined interest rate determination under two polar cases related to the degree of openness of the economy, it is possible to visualise that both open as well as closed economy factors will affect the behaviour of domestic interest rates, at least in the short run. Under the circumstances, we assume that the equation for the nominal interest rate can be

specified as a weighted average of the open and closed economy expressions. Denoting these weights by ψ and $(1-\psi)$, and combining eqs (5.36) and (5.44), we obtain:

$$i = \psi\,[\theta\{i_f + e^e\} + (1-\theta)\,i(-1)] + (1-\psi)\,[r + \pi^e] \qquad (5.45)$$

where the parameter ψ can be interpreted as an index measuring the degree of financial openness of the country with ψ ranging from 0 (completely closed economy) to 1 (completely open economy). Thus, given the data, it is possible to determine the degree of openness of the financial sector for a given economy, and this estimated degree of openness will provide some information on the actual degree of integration of the domestic capital market with the world capital market.

Substituting eqs (5.37), (5.41) and (5 39) into eq (5.45) above, we obtain the following expression for the nominal interest rate for a semi-open economy:

$$i = \delta(0) + \delta(1)\,[i_f + e^e] + \delta(2)\ln y - \delta(3)\ln m(-1) + \delta(4)\,\pi^e + \delta(5)\,i(-1) + \varepsilon \qquad (5.46)$$

where the composite parameters are given by:

$$\delta(0) = (1-\psi)[\rho+\lambda(1-\beta)\{\alpha(0)-\alpha(2)\rho\}] \qquad (5.47a)$$

$$\delta(1) = \psi\theta \qquad (5.47b)$$

$$\delta(2) = (1-\psi)\lambda(1-\beta)\alpha(1) \qquad (5.47c)$$

$$\delta(3) = (1-\psi)\lambda(1-\beta) \qquad (5.47d)$$

$$\delta(4) = (1-\psi)\,[1-\lambda(1-\beta)\{\alpha(2)+\alpha(3)\}] \qquad (5.47e)$$

$$\delta(5) = \psi(1-\theta) \qquad (5.47f)$$

and e is a random error term. Eq (5.46) s quite general because it not only incorporates closed- and open-economy features. t also allows the possibility of slow adjustment on both domestic and foreign sides.

The integration: We now have to formally integrate the nominal interest rate determination equation, given by eq (5.46), nto the framework of the model developed above. In order to do so, we initially simplify eq (5.39) and assume that the ncome elasticity of the demand for money s unity, i e, a(1) = 1. In such a case, from eqs (5.47c) and (5.47d), it is seen that d(2) = d(3), and real income and lagged money balances can be combined into one composite term, i e, [ln y-ln m(-1)], while estimating eq (5.46).

Therefore, eq (5.46) can now be rewritten as:

$$i = \delta(0) + \delta(1)\,[i_f + e] + \delta(2)\,[\ln y - \ln m(-1)] + \delta(2)\,[\ln y - \ln m(-1)] + \delta(4)\,\pi + \delta(5)\,i(-1) \qquad (5.48)$$

where we have set $\pi^e = \pi$ and $e^e = e$, and the error term ε has been dropped.

Considering that: $y = (1+g)\,y(-1)$ and $v = y/m$, i e, velocity is the ratio of real income to real money stock, eq (5.48) can be further simplified to yield the following expression:

$$i = \delta(0) + \delta(1)\,[i_f + e] + \delta(2)\,g + \delta(2)\ln v(-1) + \delta(4)\,\pi + \delta(5)\,i(-1) \qquad (5.49)$$

where v(-1) is the income velocity in the previous period.

It is thus obvious that the above equation is easily capable of being integrated into the merged framework as the interest rate is seen to be influenced by two of the three targets of the merged model, i e, inflation (π) and growth (g), as well as by an instrument, i e, exchange rate changes (e).

Eq (5.49) can be re-written as:

$$-\delta(4)\,\pi - \delta(2)\,g + i = \delta(5)\,i(-1) + \delta(1)\,e + \delta(6) \qquad (5.50)$$

where: $\delta(6) = \delta(0) + \delta(1)\,i_f + \delta(2)\ln v(-1)$ (5.51)

Structure of the Integrated Model

The structure of the integrated model, comprising eqs (5.14), (5.22), (5.34) and (5.50), is set out in Table 3 below.

VI
Monetary Stabilisation with Growth

The Model

The structure of the growth-oriented financial programming model, comprising eqs (5.14), (5.22), (5.34) and (5.50), can be set out in matrix notation as follows:

$$\begin{bmatrix} 1 & -\alpha(1) & -\alpha(2) & 0 \\ 1 & \beta(1) & \beta(2) & 0 \\ \gamma(1) & \gamma(2) & \gamma(3) & -\gamma(7) \\ 0 & -\delta(4) & -\delta(2) & 1 \end{bmatrix} \begin{bmatrix} \Delta R^* \\ \pi \\ g \\ i \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & -\gamma(8) \\ 0 & 0 & 0 & \delta(5) \end{bmatrix} \begin{bmatrix} \Delta R^*(-1) \\ \pi(-1) \\ g(-1) \\ i(-1) \end{bmatrix} + \begin{bmatrix} -\alpha(3) & -\Delta(4) & 0 \\ 0 & \beta(3) & 1 \\ 0 & \gamma(4) & \gamma(5) \\ 0 & \delta(1) & 0 \end{bmatrix} \begin{bmatrix} \Delta DC \\ e \\ \Delta F^* \end{bmatrix} + \begin{bmatrix} 0 \\ \beta(4) \\ \gamma(6) \\ \delta(6) \end{bmatrix} \qquad \ldots(6.1)$$

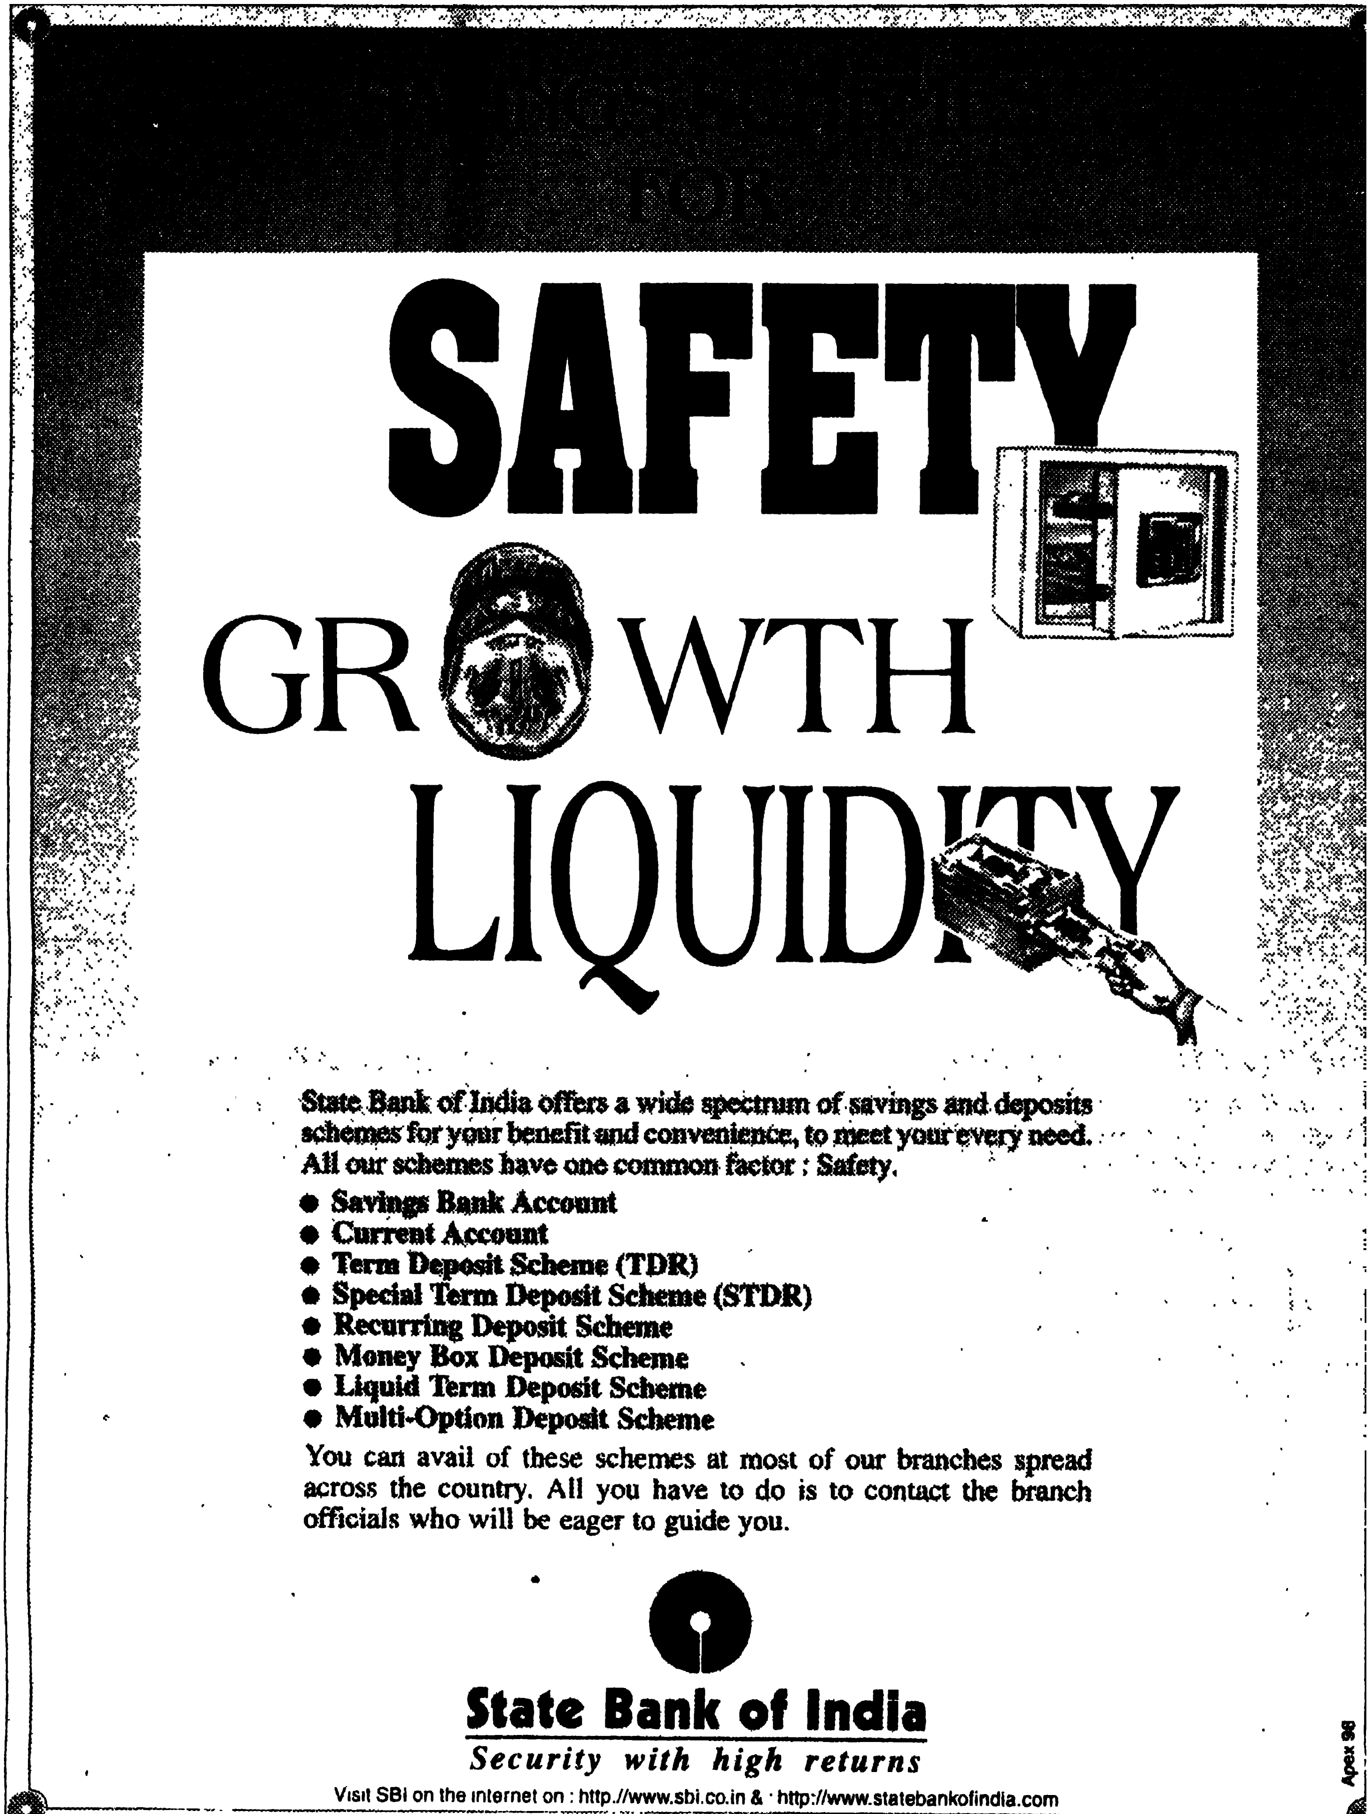
which can be written as:

$$A(0)\,x = A(1)\,x(-1) + B(0)\,u + z(0) \qquad (6.2)$$

Table 3: Structure of the Integrated Approach

Targets.	ΔR^*	change in foreign exchange reserves
	π	rate of inflation
	g	real growth rate
	i	nominal interest rate
Lagged Target:	i(-1)	nominal interest rate in the previous period
Instruments	ΔDC	change in domestic credit
	e	rate of change in the nominal exchange rate
	ΔF^*	change in foreign borrowings
Exogenous	X*	exports
	π_f	foreign inflation rate
	i_f	foreign interest rate
Predetermined	Y*(-1)	nominal income in the previous period
	Z*(-1)	nominal imports in the previous year
	R*(-1)	stock of foreign reserves in the previous period
	F*(-1)	stock of foreign borrowings in the previous period
	E(-1)	nominal exchange rate in the previous period
	s(-1)	savings propensity in the previous period
	v(-1)	velocity in the previous period
Parameters	v	velocity of money
	m	marginal propensity to import
	b	import response to exchange rate changes
	s	marginal propensity to save
	k	incremental output-capital ratio
	d	depreciation rate
	i*	savings response to interest rate changes

Notes: (1) Domestic credit (Δ DC) is measured in billions of rupees, while income (Y*), exports (X*), imports (Z*), foreign capital inflows (F*) and foreign exchange reserves (R*) are all measured in billions of US dollars. (2) The predetermined variable, E(-1), is the lagged value of the average nominal exchange rate which is defined in terms of rupees per US dollar, while the instrument (e) is the rate of change of the exchange rate, given by e = ΔE/E(-1). (3) The domestic interest rate (i) is proxied by the 1-year term deposit rate while the foreign interest rate (i_f) is proxied by the 1-year LIBOR. (4) The domestic inflation rate (π) is measured by the average wholesale price index while the foreign inflation rate (π_f) is measured by the US consumer price index



SAFETY
GROWTH
LIQUIDITY
State Bank of India offers a wide spectrum of savings and deposits schemes for your benefit and convenience, to meet your every need. All our schemes have one common factor : Safety.
• Savings Bank Account
• Current Account
• Term Deposit Scheme (TDR)
• Special Term Deposit Scheme (STDR)
• Recurring Deposit Scheme
• Money Box Deposit Scheme
• Liquid Term Deposit Scheme
• Multi-Option Deposit Scheme
You can avail of these schemes at most of our branches spread across the country. All you have to do is to contact the branch officials who will be eager to guide you.

where $x = [\Delta R^* \pi\, g\, i]'$ is a (4x1) target vector; and

$u = [\Delta DC\ e\ \Delta F^*]'$ is a (3x1) vector of instruments;

$z(0)$ = (4x1) vector of exogenous and predetermined variables;

and A(0), A(1) and B(0) are appropriately dimensioned matrices of time-varying coefficients.

To apply the above theory for the Indian economy to obtain stabilisation policy options for 1998-99, we require data on: (1) the three instruments, ΔDC, e and ΔF^*, for 1998-99; (2) the three exogenous variables, X^*, π_f and i_f, for 1998-99; (3) The eight predetermined variables, $i(-1)$, $Y^*(-1)$, $Z^*(-1)$, $R^*(-1)$, $F^*(-1)$, $E(-1)$, $s(-1)$ and $\ln v(-1)$, for 1997-98; and (4) the seven parameters, v, m, b, s, k, d and ι^*. All these are given below:[1]

ΔDC = 1145	$Y^*(-1)$ = 336.5
e = 0.15	$Z^*(-1)$ = 51.1
ΔF^* = 6.0	$R^*(-1)$ = 29.4
X^* = 45.0	$F^*(-1)$ = 94.4
π_f = 0.02	$E(-1)$ = 37.16
i_f = 0.06	$s(-1)$ = 0.266
$i(-1)$ = 0.11	$\ln v(-1)$ = 0.3784

v = 1.41
m = 4.2997
b = 1.4838
s = 0.26
k = 0.2176
d = 0.0183
ι^* = 357.92

The above data set, along with eqs (5.15), (5.23), (5.35), yields the estimated parameters of eq (6.1) which can then be used to solve the model in its positive, programming and option modes.

The Positive Mode

The estimated parameters of the model are given below:

$\alpha(1)$ = 238.65	$\beta(4)$ = –5.6056
$\alpha(2)$ = 238.65	$\gamma(1)$ = 0.000647
$\alpha(3)$ = 0.0269	$\gamma(2)$ = –0.0383
$\alpha(4)$ = 29.40	$\gamma(3)$ = 0.9434
$\beta(1)$ = 75.82	$\gamma(4)$ = 0.0420
$\beta(2)$ = 219.71	$\gamma(5)$ = 0.000647
$\beta(3)$ = 134.72	$\gamma(6)$ = 0.0396

$\gamma(7)$ = 0.2315
$\gamma(8)$ = 0.2315
$\delta(1)$ = 0.0540
$\delta(2)$ = 0.9430
$\delta(4)$ = 0.0686
$\delta(5)$ = 0.4594
$\delta(6)$ = –0.0214

Substituting these values into eq (6.1) yields the estimated forms of the matrices A(0), A(1), B(0), as well as the vector z(0). Solving eq (6.2) for x yields the following positive mode of the integrated system:

$$x = Ax(-1) + Bu + z \qquad (6.3)$$

$$\text{where } A = A(0)^{-1}A(1) \qquad (6.4a)$$
$$B = A(0)^{-1}B(0) \qquad (6.4b)$$
$$z = A(0)^{-1}z(0) \qquad (6.4c)$$

whose estimated form is given by:

$$\begin{bmatrix} \Delta R^* \\ \pi \\ g \\ i \end{bmatrix} = \begin{bmatrix} 0 & 0 & 0 & -12.159 \\ 0 & 0 & 0 & -0.1623 \\ 0 & 0 & 0 & 0.1113 \\ 0 & 0 & 0 & 0.5533 \end{bmatrix} \begin{bmatrix} \Delta R^*(-1) \\ \pi(-1) \\ g(-1) \\ i(-1) \end{bmatrix} +$$
$$\begin{bmatrix} -0.007082 & 97.12439 & 0.73682 \\ 0.000078 & 0.54823 & 0.00289 \\ 0.000005 & -0.01807 & 0.00020 \\ 0.000011 & 0.07457 & 0.00039 \end{bmatrix} \begin{bmatrix} \Delta DC \\ e \\ \Delta F^* \end{bmatrix}$$
$$+ \begin{bmatrix} -8.77698 \\ -0.07820 \\ 0.04142 \\ 0.01377 \end{bmatrix} \qquad (6.5)$$

The *ex-ante* forecasts of the four targets (ΔR^*, π, g and i) for 1998-99 can be obtained by setting: (i) the lagged target variable at its historical level for 1997-98 given above, i e, $i(-1) = 0.11$; and (ii) the three instruments at their predicted levels for 1998-99 given above, i e, $\Delta DC = 1145$, $e = 0.15$ and $\Delta F^* = 6$. This yields: $\Delta R^* = 0.77$, $\pi = 0.0924$, $g = 0.0584$ and $i = 0.1001$, implying a reserve accretion of about \$ 0.8 billion, an inflation rate of about 9.2 per cent, a growth rate of about 5.8 per cent and an (equilibrium) interest rate of about 10.0 per cent. All these forecasts, which are inherently plausible, testify to the robustness and stability of the merged framework and suggest that, despite the misgivings of several Fund and Bank economists, e g, Reinhart (1991), regarding the usefulness of such an approach due to the inherent instability of some of its key parameters, it could provide a robust framework for designing growth-oriented stabilisation policy packages.

In Table 4, which is based upon the estimated form of the matrix $A(0)^{-1}B(0)$ in eq (6.4b), the elements of each column represent the total impact of the concerned exogenous variable, as a result of setting it at its predicted level given above, upon the corresponding target. The sum of the differential impacts of these three policy settings (inclusive of the lagged target variable and the intercept term) provides the overall forecast of the concerned target variable. The results suggest that: (1) domestic credit is a powerful instrument as it has a considerable impact on reserves, inflation and growth; (2) devaluation, although inflationary, has a potential for increasing reserves without causing any considerable contraction in output; and (3) capital inflows are inflationary and their impact on output expansion is insignificant. The results also indicate that a 15 per cent nominal devaluation, by increasing the rate of inflation by 8.2 percentage points, would result in a real devaluation of about 6.8 per cent.

The Programming Mode

The excess of targets (ΔR^*, π, g, i) over instruments (ΔDC, e, ΔF^*) makes it impossible to solve the model in its pure programming mode. However, heuristic guidepost solutions for deriving a 'robust' policy can still be obtained. To do so, we pre-multiply eq (6.3) by its transpose, i e, B', and solve the resultant expression in terms of u obtaining:

$$u = B^*x - z^* \qquad (6.6)$$

$$\text{where } B^* = (B'B)^{-1}B' \qquad (6.7a)$$
$$z^* = (B'B)^{-1}B'[Ax(-1) + z] \qquad (6.7b)$$

which will exist considering that the inverse of B'B exists. However, it needs to be noted that the set of policy response functions constitutes only a 'heuristic' version of the programming mode because although it does prescribe the levels at which the three instruments should be set on the basis of the four desired targets, this policy setting will be unable to attain all the targets simultaneously and there will be a certain amount of deviation between the desired and realised targets. However, the ensuing policy prescription will be the most "robust" one inasmuch as the sum of squared deviations between the desired values of the four targets and their respective realisations will be minimal, i e, it will correspond in a sense to the least squares estimator of u [Rebonato 1996].

Table 4: Differential Impacts of the Policy Settings

Contribution of:		Impact on:			
		Reserves	Inflation	Growth	Interest Rate
Domestic	(ΔDc = 1145)	–8.11	0.0893	0.0057	0.0126
Exchange rate	(e = 0.15)	14.57	0.0822	–0.0027	0.0112
Capital inflows	(ΔF^* = 6.0)	4.42	0.0173	0.0012	0.0023
Lagged interest rate	(i_{-1} = 0.11)	–1.34	–0.0782	0.0122	0.0137
Exogenous factors		–8.78	–0.0179	0.0414	0.0609
Total		0.77	0.0924	0.0584	0.1001

Using the estimated matrices A, B and z specified in eq (6.5) above, and setting $i(-1)=0.11$, we obtain the following estimated form of eq (6.6).

$$\begin{bmatrix} \Delta DC \\ e \\ \Delta F^* \end{bmatrix} = \begin{bmatrix} -37.16 & 7426.9 & 28220.7 & 636.37 \\ 0 & 1.1871 & -17.701 & 0.3934 \\ 1 & -85.089 & 2604.52 & -45.7381 \end{bmatrix} \begin{bmatrix} \Delta R^* \\ \pi \\ g \\ i \end{bmatrix} - \begin{bmatrix} 1224.5 \\ -1.0346 \\ 134.42 \end{bmatrix} \quad (6.8)$$

Thus, it is seen that domestic credit is inversely related to reserves and positively related to both inflation and growth; exchange rate depreciation is positively related to inflation and interest rates and negatively to growth; while capital flows are positively related to reserves and growth and negatively to inflation and interest rates.[2] The programming mode implies that target values for reserve accumulation (ΔR^*), the inflation rate (π), the growth rate (g) and the interest rate (i) must initially be assigned in order to obtain the corresponding instrument values. Setting $\Delta R^* = 2.0$ (i e, a reserve accumulation of \$ 2 billion), $\pi = 0.09$ (i e, a 9 per cent inflation rate), $g = 0.06$ (i e, a 6 per cent growth rate) and $i = 0.10$ (i e, an equilibrium interest rate of 10 per cent), we solve eq (6.8) above obtaining: $\Delta DC = 1126$, $e = 0.1187$ and $\Delta F = 11.6$. This implies that domestic credit expansion would have to be constrained to about Rs 1,126 billion, the nominal exchange rate should be allowed to depreciate by just about 11.9 per cent above its average level of Rs 37.2 per US dollar in 1997-98 and capital inflows should be of the order of around \$ 12 billion. Apart from the fact that the current exchange rate depreciation has already overshot this optimal level, the above policy package calls for an inordinately high level of capital inflows which, apart from being improbable in the current economic milieu, could be highly dest-abilising. We thus have to treat the above instrument setting as unfeasible and therefore revert to the option mode of the system.

VII
Designing Alternative Stabilisation Policy Options

In order to obtain greater insights into the trade-offs implicit in designing growth-oriented stabilisation policy, we expand eq (6.8) above obtaining:

$$\Delta DC = -37.16\Delta R^* + 7426.9\pi + 28220.7\,g + 636.37\,i - 1224.5 \quad (7.1a)$$

$$e = 1.1871\,\pi - 17.701\,g + 0.3934\,i + 1.0346 \quad (7.1b)$$

$$\Delta F^* = 1.0\,\Delta R^* - 85.089\,\pi + 2604.52\,g - 45.7381\,i - 134.42 \quad (7.1c)$$

Based upon the results of the previous section, the objective now is to design a feasible growth-oriented stabilisation package and obtain guidelines regarding the spectrum of alternative 'robust' policy options which can attain the desired objectives.

As such, we continue to target a 6 per cent growth rate and a 9 per cent inflation rate. Therefore, setting $g=0.06$ and $\pi=0.09$ in eq (7.1) above yields:

$$\Delta DC = -37.16\,\Delta R^* + 636.37\,i + 1137.12 \quad (7.2a)$$

$$e = 0.3934\,i + 0.0794 \quad (7.2b)$$

$$\Delta F^* = 1.0\,\Delta R^* - 45.7381\,i + 14.19 \quad (7.2c)$$

The above system which is now used to determine 'robust' policy options comprises a set of three equations in five unknowns which implies that any two of them (except the combination e and i) can be targeted exogenously and this would yield solutions for the remaining three. However, an exchange rate alignment perspective would suggest that the exchange rate ought to be determined endogenously and, as such, we shall not target it a priori. Therefore, with two degrees of freedom and with only four variables to choose from, this implies that we have six alternative stabilisation options. The results of these alternative simulation exercises are provided in Table 5.

The results clearly indicate that there exists a wide spectrum of alternative, and more importantly, feasible policy options which are capable of attaining the desired objectives (of a 6 per cent growth rate and a 9 per cent inflation rate). Option # 1 is essentially a base run scenario which indicates that if the interest rate and reserve accretion remain in the neighbourhood of their current projections, then the nominal exchange rate must be allowed to depreciate by about 12.3 per cent. In such a case, the desired level of credit expansion would also be unaltered *vis-a-vis* its initial projection although the optimal level of capital inflows could turn out to be very high.

Although Options # 2 and # 3 both target zero reserve accretion ($\Delta R^* = 0$), they provide an interesting study in contrasts. While the amount of credit expansion is almost identical in both the options, the former calls for a much higher level of capital inflows (\$ 9.6 billion), a reduction in the interest rate (to 9.9 per cent) and a lower level of exchange rate depreciation; while the latter invokes a lower level of capital inflows (\$ 8 billion), an increase in the interest rate (to 13.6 per cent) and a higher rate of exchange rate depreciation. However, going by the recent trends in exchange rate movements, it seems that the latter option is the more feasible one.

Option # 4 is essentially a 'cold turkey' strategy as it invokes the classic Fund prescription of a strong dose of credit restraint and devaluation, coupled to a substantial increase in the interest rate. While reserve accretion is certainly impressive at almost \$ 1.9 billion, it would require additional capital inflows to the extent of \$ 10.1 billion (almost on the lines of an IMF 'bail-out').

Options # 5 and # 6 are the most interesting ones because they are basically 'gradualist' strategies that are diametrically opposed to the Fund prescription set out above. Both advocate strong credit *expansion*, a milder dose of devaluation, and a moderate increase in the interest rate. More importantly, they do not need

Table 5: Stabilisation Policy Options for Macro-Economic Adjustment

Option	ΔDC	e	ΔF*	ΔR*	i
#1	1170	0.1227 (Rs 42.34/\$)	10.2	1*	0.11*
#2	1200*	0.1183 (Rs 42.01/\$)	9.6	0*	0.0988
#3	1223	0.1327 (Rs 43.08/\$)	8.0*	0*	0.1355
#4	1150*	0.1305 (Rs 42.92/\$)	10.1	1.9	0.13*
#5	1275*	0.1205 (Rs 42.18/\$)	7.5*	-1.9	0.1045
#6	1314	0.1266 (Rs 42.63/\$)	6.0*	-2.7	0.12*

Notes: (1) In each option, the two starred figures are the values fixed exogenously for the concerned variable. The 3-equation system was then solved for the remaining three variables; (2) The figures in parentheses below each estimate of e indicate the average corresponding exchange rate that must prevail over the second half of 1998-99.

to be financed by large capital inflows although they do entail a drawdown of reserves. The last option, which seems the most feasible one in terms of implementation, broadly suggests that the average exchange rate should be contained at around Rs 42.63 per US $ over the second half of 1998-99, while the interest rate should be increased marginally to around 12 per cent. This would allow the desired growth and inflation targets to be achieved with a much lesser requirement of capital inflows ($ 6 billion), although it would involve a higher-than-projected level of reserve drawdown ($ 2.7 billion).

Thus, it is seen that by integrating the interest rate into the merged framework, the extended model is better suited for analysing alternative stabilisation options as it exploits the underlying complementarity between monetary reform and growth-oriented adjustment programmes. The most important lesson learnt from these exercises is that there exist policy options that, despite being opposed to the conventional thinking on this subject, are feasible and sustainable as they do not involve excessive reliance on foreign borrowings and/or reserve depletion.

VIII
Conclusions

The attractiveness that characterises the financial programming framework of the Fund and the financial requirements framework of the Bank is that they require little data to work with and are relatively easy to utilise. However, these two models *per se* do not contribute much to an understanding of the complex policy responses that are required to design a stabilisation package that will simultaneously eliminate macro-economic imbalances (in the form of BOP disequilibria and rising inflation) as well as raise the growth rate.

The composite model presented here represents a synthesis in technical terms of these two sub-models and not only carries forward their appealing simplicity and their potential flexibility, but is also better equipped to investigate issues involving growth-oriented adjustment. More importantly, the merged model endogenously eliminates unattainable growth paths, and therefore the planner does have the option of modifying the instruments in order to achieve the BOP and inflation targets consistent with the remaining set of feasible growth trajectories. So, if used flexibly and with the necessary care, the merged model is capable of drawing attention to the possible trade-offs which policy-makers have to face while designing stabilisation growth-oriented programmes. However, it needs to be noted that while the merged model does yield very useful insights into the basic relationships between the BOP, inflation and interest rates that would need to be taken into account while designing programmes in which growth is an explicit objective, the present version represents only a natural first step in the search for an integrated framework within which growth-oriented adjustment issues can be analysed.

All this highlights the need for sound financial policies to back growth-oriented adjustment programmes in order to create an atmosphere of confidence in the future of an economy and its management. Without such confidence, savings will tend to be transferred abroad and private investors will either postpone or cancel domestic capital investments. One of the unfortunate consequences of weak confidence in macro-economic management is that domestic interest rates would have to be raised to very high levels to avoid capital flight but, at such levels, borrowings for productive purposes could well be discouraged leading to a dampening of economic activity.

Therefore, changes in interest rates and other financial reforms must be co-ordinated with the policy actions that are part of the stabilisation programme. The experiences of a number of developing countries with financial reform seem to suggest that this co-ordination is especially vital during the early phases of the adjustment programme. In particular, certain combinations of policies can be potentially destabilising for a financial system undergoing major structural change. For example, if a large fiscal deficit is being financed through excessive market borrowings by the government, then there could be limited scope for the successful implementation of a sound interest rate policy or a financial reform programme. The rise in interest rates that would be associated with such a fiscal deficit could potentially lead to destabilising changes in the flow of funds in and out of the financial system as well as between different types of financial institutions or instruments. The inability to control fiscal deficits is often considered to be one of the most important factors that contribute to the failure of growth-oriented adjustment programmes and, as such, until the fiscal accounts can be brought under control, major financial reforms may have to be deferred.

While all these potential pitfalls make the process of monetary reform and financial liberalisation a rather hazardous one, they should not be viewed as a rationale for maintaining high negative yields on domestic financial instruments and an inefficient financial system. While growth-oriented adjustment programmes often warrant a sharp increase in interest rates, very often such an excessive increase could affect investment and create problems with capital flows. In such a situation, it may be more appropriate to adjust interest rates gradually as the new stabilisation and financial reform policies take hold. For this to be successful, however, the public would have to believe that the authorities were committed to carrying out the reforms based on realistic objectives. If such a perception is established, then the maintenance of positive yields on domestic financial instruments would strengthen domestic savings and the financial system.

With many developing countries irrevocably committed to liberalising their domestic financial systems, the twin issues of interest rate and exchange rate determination, in general, and the manner in which they can be expected to behave in the changed environment and respond to domestic and foreign influences, in particular, is becoming increasingly important. Only when the behaviour of interest rates and exchange rates is well understood will it be possible to predict their effects on key macro-economic variables such as BOP, inflation, savings, investment and, above all, economic growth. After all, to affect these variables is the real purpose for which all liberalisation policies have to be designed.

Notes

[This is a revised version of the paper presented by the author at the workshop on 'Future Directions for the Indian Economy. Macro-economic Issues Relating to Finance and Capital', held at the Gokhale Institute of Politics and Economic, Pune, from December 4-6, 1998.]

1 All the seven parameters of the model, as well as the five coefficients of the interest rate equation, were estimated using the Kalman filter time-varying parameter model [Rao and Singh 1995] and based upon annual time series data on the Indian economy over the period 1985-86 to 1997-98 The following structural equations were invoked during the estimation process: (i) Eq (5 10) was used to estimate v; (ii) Eq (5.19) was used to estimate m and b; (iii) Eq (5.26) was used to estimate k and d; (iv) Eq (5.27) was used to estimate s and i; and (v) Eq (5.48) was used to estimate δ(0), δ(1), δ(2), δ(4), and δ(5) which, using eq (5.51), yielded δ(6).

2 That there is no relationship between ΔR^* and e is an important corollary of such a merger and needs to be explained . To do so, assume, for simplicity, that the imports function is given by: $Z = Z(-1) + m\Delta Y - b\Delta E$. Substituting

this into the external sector financial constraint given by. $\Delta R = (X-Z) + \Delta F$, and rewriting it in terms of ΔE yields:

$$\Delta E = (1/b)\Delta R - (1/b)X + (1/b)Z(-1) + (m/b)\Delta Y - (1/b)\Delta F \quad (a)$$

Eq (a) implies that to increase ΔR by one unit, the increase in ΔE should be $(1/b)$. Eq (a) is valid for the programming mode provided all its explanatory variables are either target or exogenous variables, and the latter set of variables are not affected by exchange rate changes. In the merged model, as ΔF is an instrument, it can no longer remain on the right-hand-side of eq (a) and must be replaced appropriately. To do so, substitute the investment constraint given by: $I=S+\Delta F-\Delta R$, into an output equation given simplistically by, $\Delta Y = kI$, and rewrite the resulting equation in terms of ΔF to yield:

$$\Delta F = (1/k)\Delta Y - S + \Delta R \quad (b)$$

Eq (b) implies that to increase ΔR by one unit, ΔF should be increased by one unit. However, from eq (a), this implies that the decrease in ΔE should be $(1/b)$. Therefore, the requisite change in the exchange rate is seen to be zero, as the devaluation in the exchange rate required to increase ΔR by one unit is exactly offset by the revaluation that will be required as a result of the consequent increase in ΔF. The basic stabilisation implication of the result is that, once the target inflation and growth rates are specified, the desired change in the exchange rate is uniquely determined, and any subsequent changes in desired reserves will have to be met either by changes in domestic credit or foreign borrowings.

Inflation Targeting

Issues and Relevance for India

R Kannan

Some developed countries have practised inflation targeting as a part of monetary policy during the 1990s. Price stability is needed to create a stable and non-inflationary environment for resource allocation. Stable price expectations are necessary for long-term contracts. Successful inflation targeting requires credibility of the enforcing agency, usually the government and the central bank. Credibility in turn requires that the target be chosen carefully. This article reviews inflation targeting experience so far and analyses the issues related to it. It argues for developing an inflation model for India. Inflation targeting in India should wait until financial sector reform agenda is accomplished.

INFLATION targeting is a product of the 1990s. New Zealand and Canada were the first to adopt an explicit target path for prices followed by the UK, Finland, Israel, Spain and Sweden. In the literature of monetary economics, inflation targeting has an important position. The gain in popularity of inflation targets can perhaps best be seen as a step in the evolution of monetary policy regimes in countries which have battled to achieve or at least to maintain monetary and price stability over a period of time. A number of countries have in the past pursued monetary aggregate targets or exchange rate targets, or both, as an intermediary goal along the path to medium-term inflationary control. The experience with such intermediate targets had its disappointments. The announcement of a specific goal for inflation is nothing but an attempt to anchor inflationary expectation and develop a measure of confidence in the conduct of monetary policy in much the same way that monetary and exchange rate objectives were designed to do.

It is important to mention that unlike the adoption of monetary targets in the mid-1970s, inflation targeting practices had not been much influenced by academic discussion. Indeed, while inflation targeting is obviously a manifestation of the principle of long-run monetary neutrality, there is a paucity of academic literature on operating monetary policy with explicit inflation targets, compared with discussion on monetary targets, nominal GDP targets and exchange rate targets. Since in many circumstances the announcement of inflation targets is a relatively recent phenomenon, no country has yet operated with an inflation target through an entire business cycle.

The intellectual roots of inflation targets are much older. Alfred Marshall (1887), Knut Wicksell (1898) and Irving Fisher (1922) were early advocates of a price level target for monetary policy. The operationalisation of price stability target in actual monetary policy arrangement has been subject to periodic changes starting from the classical gold standard through the monetarist idea of targeting of the money supply to the recent direct commitments by central banks to low and stable inflation. The gold standard was, by its very nature, a system designed to maintain the value of money in the long term, since the value of gold was expected to remain stable. Gold was, therefore, accepted as a standard unit of account and the national currencies were pegged to it. The eventual abandonment of gold as the universal measure of value in the 1930s happened in a situation where the value of gold *vis-a-vis* most commodities was rising sharply and hence maintenance of the gold standard seemed to lead to serious deflation in many countries. After the second world war, the influence of Keynesianism de-emphasised the idea of price stability as the main goal of monetary policy. The most recent development which has taken place in the 1990s is the idea of targeting inflation directly which has become increasingly attractive worldwide and a number of central banks have actually made a formal commitment to low inflation.

The basic reason for adopting price stability as the primary objects of monetary policy is to create a stable and non-inflationary environment for resource allocation and to stabilise price expectations which is an essential requirement for long-term contracts. In general, price stability refers to a situation where money maintains its purchasing power hence the first inclination would be to a future price level target as the goal that is most consistent with the concept of price stability. However, with the passage of time, most economies and policy-makers opt for inflation targeting as the goal of monetary policy to emphasise the stabilisation of the rate of inflation permanently at a low level. We must be very clear that there are fundamental theoretical and practical differences between price level targeting and inflation targeting. A low inflation target does not guarantee price stability in the long term. Even an annual rate of inflation of 2 per cent means that prices will double in 36 years, i e, within one generation.

Inflation targeting has its origin from two important issues. The first is the problem of credibility. Explicit commitments have been made in order that the private sector will be convinced to the authorities' good faith and make a low inflation equilibrium sustainable and attainable at minimum cost. The second problem is known as 'policy engineering' which refers to the task of bringing about price stability. After episodes of exchange rate targeting and monetary targeting, the inflation target embodies the wisdom of Milton Friedman (1975) who demonstrated that it was optimal to target the final variable directly rather than via an intermediate target. Inflation targets are therefore a mixture of the solution to the problem of how best to convince economic agents regarding the authorities' good intentions and to the problem of how best to carry them out.

Inflation targeting has found widespread acceptance in recent years. But the empirical case supporting them remained rather flimsy. It is useful therefore to compare the performance of an inflation target against that of other potential monetary policy strategies. In general, economic literature suggests three strategies, viz, inflation and GDP targeting, nominal GDP targeting and monetary targeting [Bryant et al 1993]. Inflation and GDP targeting is simply a hybrid inflation targeting which places a non-zero weight on the stabilisation of output relative to the trend. Such a rule would be consistent for those authorities having an optimal rate of inflation which guards against the significant real costs associated with too

rapid disinflation. Nominal GDP targeting could be considered a slightly more restrictive variation of this rule which places equal weight on the stabilisation of inflation and output relative to their target value. The experiences of countries indicate that if supply shocks are more prevalent, nominal GDP targeting is the better monetary policy response. Monetary targeting was given up by many countries consequent to the financial liberalisation process and higher volatility found in money velocity.

This article is organised in four sections. Section I gives a brief account of inflation targeting practices in various countries and the issues associated with these practices are discussed in Section II. Factors contributing to its relevance for India are discussed in Section III.

I
Experience of Other Countries

An Inflation target was first adopted in New Zealand in 1990 under policy targets agreement between the governor of the Reserve Bank of New Zealand and the minister of finance. Canada followed this approach in 1991, Israel in December 1991, UK in October 1992, Sweden and Finland in February-March 1993, Mexico in September 1994 and Spain in November 1994. Although Australia has had a quantitative inflation objective, it is very difficult to precisely date its introduction. Some of the industrial countries, which continue to adhere to intermediate targets, have recently sought to clarify their price stability objectives numericaly. For example, within Europe, Germany, France, Italy and Portugal have all specified in quantitative terms their medium-term inflation goal. Each of these countries also had a recent history of relatively high inflation and had previously adopted intermediate targets such as monetary or exchange rate targets. After switching to inflation targets, their inflationary rates fell sharply and in some cases more rapidly than what the authorities had expected (Table 1, Graph).

Although practices adopted by these countries are not identical, one could see a number of commonalities in terms of target, transparency and credibility measures (Table 2). The targets are typically defined in terms of an inflation range about 2 to 3 percentage points wide depending upon the degree of openness and the strength of monetary policy transmission channels, etc. Given the lags in the transmission process, monetary policy is tightened if inflation is projected to overshoot the target and eased if inflation is projected to fall below the target. To increase transparency and to help focus in containing inflationary expectations, and also to enhance the effectiveness of monetary policy, many inflation targeting countries release official inflation forecasts several times a year. Attempt is also made to boost the credibility of the target by explicitly announcing the accountability of the central bank executives.

The adoption of inflationary targeting in Australia in the second half of 1993 was the result of a joint commitment by the central bank and the government. Australia's inflation objective was initially adopted by the Reserve Bank unilaterally with the government endorsing this policy later. The timeframe over which the underlined inflation is to be measured and the acceptable extent and duration of deviations from the central bank tendency are not precisely specified due to stochastic behaviour of prices and the difficulties involved in forecasting inflation. Hence 2 to 3 per cent should be interpreted as a broad central tendency for inflation thick point rather than as a narrow target band. While 2 to 3 per cent objective was not openly announced, it is increasingly found in the Reserve Bank policy statement and other public utterances over the past couple of years.

In the case of Spain, the adoption of inflation targeting was partly institutional and partly technical. On the institutional front, the Bank of Spain attained autonomy in June 1994 and price stability objective was put in place and the Bank of Spain was given statutory responsibility to pursue it. Hence, the new monetary policies framework aimed to improve transparency in the setting up of monetary policy and to bolster credibility. At a technical level, the adoption of inflation target coincided with the abandonment of broad money aggregate due to increasing incidence of unpredictable broad money velocity shift, consequent to financial liberalisation and the entry of Peseta into the exchange rate mechanism in 1989. There had been periods in which it was difficult for the central bank to reconcile the desirable course of monetary aggregates with the Peseta's positions within the established bands.

The introduction of stabilisation programme in Israel in 1985 paved the way towards some orderliness in the conduct of monetary policy. Since December 1991, crawling exchange peg rate was in operation. An announcement of the explicit inflation target coincided with the move to a crawling peg. Indeed the inflation target helped dictate the course of exchange rate crawl. Inflation target in Israel was first announced at the end of 1991 as a part of transition from a horizontal exchange rate band to a crawling band regime. The rate of crawl under the new system was determined by the gap between the inflation target and inflation among Israel's main trading partners and this rate of crawl had been lowered progressively, both as a means of and as a reflection of inflation control in Israel However, while the inflation target was initially linked to the prevailing exchange rate system, its importance for monetary policy has grown substantially. Since 1994, the target has been formally endorsed by the cabinet. The asymmetry of the exchange rate distribution during the period of crawling band is the result of dual objective of exchange rate policy, viz. to control inflation so that sensitivity to afford deviation from the mid point rate was particularly great. In a small open econc.ny such as Israel, exchange rate place a crucial role as the principal anchor for policy

In the case of UK, having tried both monetary and exchange rate targets since the 1970s, inflation target was the last in a long line of monetary regimes. The credibility of the authorities was no doubt enhanced by the publication of the Bank of England's quarterly inflation report, which is the bank's independent assessment of inflationary trends in the country. The publication of the minutes of the meeting between the chancellor and the

governor, *inter alia* are some of the steps initiated to enhance policy credibility, transparency and accountability The UK has chosen to target the rate of increase of retail prices excluding mortgaged interest payments Two factors weighed heavily in the choice of price index in the design of inflation target: first the definition of inflation under the target should reflect an assessment of where the costs of inflation lie, it should marry with the established theory; second, any credibility gains to be had by making the target public will depend on which index the public feels to be important.

In the case of Sweden, the Riskbank was forced to abandon the fixed rate exchange regime in 1992 and decided to let the Krona float. In a fixed exchange rate regime with price stability as the ultimate objective, the exchange rate functioned as an intermediate goal of monetary policy. The central monetary policy indicator is then cross border flow of foreign currency and the primary concern was then to ensure that the level of interest rates is such that the currency flows are in balance. With a floating exchange rate, monetary policy adopts some other intermediate target as an anchor, and hence inflation targeting became the anchor to monetary policy to contain inflation expectations.

The Bank of Finland has so far been the only central bank that has announced an explicit inflationary target in terms of a single figure. A single figure was specified since it was considered that it would provide a better guide for the formation of inflation expectations, given the country's inflation history and high inflation expectations due to substantial depreciation of Markka earlier. It was not claimed that the target should be met exactly every month. Because of temporary shocks, lags in the transmission policy and uncertainty about the policy deviations, temporary deviations by both sides were allowed The Bank of Finland defined the target in terms of underlined rate of inflation which is calculated from the consumer price index by eliminating the effects of government subsidies, indirect taxes, house prices and mortgage interest payments. These measures were chosen with a view to limiting a number of potential disturbances, which would also avoid any explanation, by the authorities at a later stage.

II
Aspects of Inflation Target Practice

The experience of various countries working with inflation target has given rise to some important issues, which are discussed below.

Choice of Index

There are different measures of inflation such as WPI, CPI, GDP deflator, etc. On theoretical grounds, the index most appropriate for serving as a target is that of GDP prices. But many economists have argued in favour of CPI, because CPI is more familiar, better understood by individuals, the method by which it is calculated is more precise and it is published more often [Friedman 1994]. However, CPI contains items which are subjected to relatively frequent supply shocks, causing it to fluctuate widely. For this reason, many central banks tend to prefer the 'underlying inflation rate', i e, CPI excluding items whose prices vary sharply. For example, in Canada, this applies to food and energy, in Britain it is the mortgage rate and in Finland it is apartment prices, the mortgage rate, taxes and subsidies. In the case of New Zealand, exogenous terms of trade shocks are excluded. In Israel, the monthly CPI fluctuates widely because of the movements in the prices of housing, fruits and vegetables and government controlled goods. However, Israel has chosen CPI as the inflation target for two important reasons: (i) the group of items whose prices fluctuate widely constitute 40 per cent of CPI so that deducting them would impair the credibility of the target, and (ii) indexation arrangements and CPI index contracts are widespread in Israel and many financial assets are CPI indexed. Hence the prevalence of agreements indexed to the overall CPI is not sufficient to justify including volatile components in the target definition. Indexing financial instruments to the CPI does not meet all the hedging needs of all consumers. While indexation made it easier to synchronise prices, price insertion still existed as a result of nominal rigidities. Hence simply announcing a low inflation target was not sufficient to reduce actual inflation. Moreover indexation caused shocks to the price level to be translated into a new level of inflation. However, the economic literature suggests that indexation is a double-edged sword; it made price stability easier to maintain following favourable inflation shocks but made it harder following adverse price shocks.

Alchian and Klein (1973) and later Goodhart (1994) have argued that there is no good reason why we should exclude the price of future goods and services from the index. If we think consumers maximise utility intertemporarily, we should set policy with respect to an index that measures the relative price of current and future goods and services. Hence they argued that lack of indexation in the economy is not a reflection of the cost of indexation *per se*.

However, with reference to GNP deflator, it is important to mention that while this does include the price of recently produced assets, it does not include the price of existing assets. Another consideration – one that suggests GDP deflation as an alternative – is that inflation targets are currently defined over indices that aggregate the prices of final goods. But what about transactions involving commodities, raw materials or intermediate goods or labour? In principle, the prices that should be targeted are those where the cost of inflation is felt more acutely, where longer term nominal contracts predominate. There is, therefore, an argument for including intermediate prices in the target measures of the price level.

Speed of Approach to Target

It is important to distinguish the achievement of inflation target in the medium term and in the short term. Usually these targets vary depending upon the period we consider. For example, in the UK, the target has been 1 to 4 per cent in the short to medium term 1 to 2.5 per cent in the medium term and less than 2 per cent in the long term. This left some flexibility about how rapidly the target should be approached. But there is a risk there. If the present rate of inflation is very close to medium term objective, then, the inflation target would create some confusion in the minds of the public.

Level of Target

There is no uniform opinion even among policy-makers regarding the tolerable level of inflation. Furthermore, a question which often arises is: should the target be zero inflation or a small positive rate of inflation. Experience of various countries does suggest a need to target a positive inflation rate. In the case of the UK, RPIX inflation of 2 per cent or less is regarded as tantamount to price stability. Once Federal chairman Greenspan asked a question, "What rate of inflation is sufficiently low that it does not materially enter business and household financial decisions." This level in general is considered as price stability. Economic literature is also varied in this aspect. Some argue that 0.0 is a unique number – in Milton Friedman's word a Schelling point. Fisher (1994), Summers (1991) and Corden (1994) argue that rigidities in price estimation are sufficient reason to pursue a small single strict inflation rather than an absolute zero. Summers (1991) has argued that a direct zero inflation regime removes the potential for negative real rate of interest which might be appropriate at times to facilitate recovery. Hence Summers argued for a small positive rate of inflation. However, by far the most important fact is that no country has achieved absolute price stability in the past 50 years and even achievement of low positive inflation over long periods has been quite rare, so our knowledge of empirical behaviour of modern economies in the region of zero inflation is scant. The longest period of relatively stable low inflation in recent history occurred in Germany from 1954 to 1971 with an overall inflation of 2.3 per cent with a standard deviation of less than 1 per cent. However, in the last 3 years, inflation in many industrial countries lie in the region of 2-3.5 per cent.

The basic reasons for adopting price stability are to create a stable and non-distortionary environment for resource allocation and to stabilise price expectations which is an essential requirement for long-term nominal wage and price contracts. In countries like India, price stability is the most effective environment to protect the vulnerable section of the population. Some economists argue that a low inflation target does not guarantee price stability in the long run. Even an annual rate of inflation of 2 per cent means that prices will double in 36 years, i e, within one generation. Moreover, it has been pointed out that in case of inflation targeting with random errors, uncertainty about future price level increases with the forecast horizon and hence price level targeting may be preferable [Fisher 1994]. If the target is to be the price level, periods of inflation will have to be matched not by disinflation but by deflation and such deviations are inherently costly. Historically, inflation stability is more common than price level stability, although typically it occurs at low rates of inflation.

While a target of zero inflation has often been suggested, arguments in favour of low positive inflation have also been put forward recently. Moreover it is argued that inflation should be targeted at its current rate because loss of economic output that accompanies a reduction in inflation is greater than any potential benefit [Gordon 1990]. Summers (1991)

suggested that a long-term goal of 2 to 3 per cent inflation is preferable on the grounds that the loss from low positive rate of inflation is likely to be small and that there is no evidence of instability resulting at low rate of inflation. Fisher (1994) suggested a range of 1 to 3 per cent as the optimal rate of inflation because, first, it may be useful for the real rate of interest to be negative; secondly with positive productivity growth, a stable price level would imply declining nominal wages; and thirdly, measures of inflation are biased upwards.

Width of Target Band

The band's width must be sufficient to encompass the impact of shocks to the price level which occur in the interval between setting of policy and its impact on inflation. The limitations to fine-tuning

TABLE 2: INFLATION TARGET PRACTICES IN VARIOUS COUNTRIES

Country	Starting Date	Inflation Target	Caveats	Transparency Measures	Credibility Measures	Time Specific
New Zealand	March 1990	Annual CPI inflation rate (defined as the 4-quarter rate of change) of 0-2 per cent	The underlying inflation measure which is now more widely used, excludes the effects of exogenous shocks, for example, increases in indirect taxes, mortgage interest rates, and terms-of-trade changes.	Monthly publication of monetary policy statement, quarterly release of inflation projection, and frequent press statements by Reserve Bank officials	The Reserve Bank Act of 1989 defined price stability as the sole objective of monetary policy. Policy target agreements are negotiated between the Reserve Bank and the government, subject to a highly public government override. The Reserve Bank Act was part of a decade-long series of wide-ranging public sector reforms which culminated in the enactment of the Fiscal Responsibility Act in 1994	Yes (updated annually)
Canada	February 1991	12-month CPI inflation rate of 1-3 per cent	In practice, the Bank of Canada excludes food and energy prices from the CPI. Other caveats include indirect tax increases and terms-of-trade stocks (for example, a large increase in oil prices)	Regular progress monitoring, particularly in the Bank of Canada's Annual Report, but official inflation forecasts are not made public	Joint announcement of the inflation target by the minister of finance and the governor of the Bank of Canada. There were no major changes to the BOC's mandate, it remains responsible for the operation of monetary policy, subject to a highly public government override.	Yes
UK	October 1992	Underlying inflation rate of 1-4 per cent, to reach the bottom of this range by 1997, 2.5 per cent or less thereafter	Underlying inflation is measured by the annual rate of change of the retail price index, excluding mortgage interest payments (RPIX)	Publication of quarterly 'inflation report' by the Bank of England (including its inflation outlook) and monthly monetary report and minutes of meeting between the chancellor and the governor by the treasury.	There were no major institutional changes – the government still controls short term interest rates, although the Bank of England may determine the timing of interest rate changes	No
Sweden	January 1993	Annual rate of CPI inflation of 2 per cent from 1995, within a range of 1 per cent	None	Publication of inflation reports three times a year, but reports lack explicit inflation forecasts.	There is no legislated price stability goal, in fact, the Riksbank can change the target at any time	No
Finland	February 1993	CPI inflation rate to be stabilised permanently at 2 per cent by end-1995.	In practice, an underlying inflation measure is used which excludes transitory effects of indirect taxes, government subsidies, house prices and mortgage interest payments from CPI	Publication of twice-yearly monetary policy reports, and a quarterly inflation report. Occasional publication of inflation forecasts	The inflation target was perceived as unrealistic and inappropriate, given the rising unemployment, and government endorsement was late. No accompanying institutional changes were proposed, but the Bank of Finland has called for 'broad social commitment' to the target	No
Australia	1993	Underlying inflation rate of 2-3 per cent on average over the course of the economic cycle.	The underlying inflation measure excludes identifiable extraneous factors, for example, the effects of mortgage interest rate changes.	Quarterly release of inflation figures, but official inflation forecasts are not made public.	There were no major accompanying institutional changes	No medium term
Israel	1991	CPI, 8-15 per cent for 1995 (updated annually).	Good controlled prices and energy prices.			Yes
Spain	1997	Below 3 per cent	Mortgage interest payments			Yes

have to be recognised here. If the target is not defined in terms of underlying inflation, allowance might be made for variation in the target measure around the desired underlying level. Finally, a wider band is needed if the policy-makers plan to dampen the effect of supply shocks on output. However, there is a danger here that this would damage the credibility of the authorities' commitment to price stability and raise the suspicion that the true target is the upper boundary of the announced target zone. In choosing the band width, there is a trade-off between losing credibility because the target is missed and losing credibility because the target is so widened it provides little discipline for monetary policy.

Countries which have adopted an inflation target have preferred a 2 to 3 per cent band to a specific point. Although Israel chose a specific point for most of the period recently, deviation from it led policy-makers to switch to a 3 per cent band in 1995.

Hence it is important to note that setting a specific point for the inflation target cannot be credible. At the same time there is a danger that public will ascribe credibility only to the upper end of the band so that it should be relatively narrow. The following aspects are important in determining the width of the band: (i) The volatility of inflation depends on its level so that the width of the band should be set as a function of this. This means that with the reduction of inflation, the width of the band should be reduced. This is very important for countries experiencing high inflation. (ii) There is a substitution between width of the band and the choice of the relative index. Excluding volatile components from the target index, as is done in many countries, makes it possible to set a narrow band.

One interesting question is whether specifying only an upper limit of the inflation target, as was done in Spain, was enough to guide policy-makers. Spain had chosen an upper limit for the inflation target which was consistent with Spain's convergence programme. Setting a lower limit was not credible, given the starting point of inflation.

Some economists argue that the inflation target should be defined in terms of relatively wide fluctuation range even for countries close to price stability. Since the credibility of an anti-inflationary policy has already been achieved in these countries, expectations have also been adjusted to low levels of inflation. Even though there have been periods with relatively high average inflation and inflation variability, the credibility of monetary policy and the overall commitment to low inflation have not diminished in countries close to price stability. However, when the targeted inflation rate is measured by some adjusted price index that excludes the effects of temporary factors disturbing the measurement of true underlying inflation, the need for flexibility is smaller.

Canada, New Zealand, Netherlands, Portugal and Sweden all have inflation target ranges from 2 to 3 per cent points wide. The UK inflation target is in the range of 1 to 4 per cent, Australia in the range of 2 to 3 per cent and described as a thick point rather than a range. Germany, France both operate with upper limit of 2 per cent as their medium-term objective.

The reason for suggesting a range rather than a point is that policy technology is not accurate enough to forecast finely callibrated changes in the price level or inflation rate. According to the Bank of Canada "policy changes cannot be calibrated so precisely as to achieve an exact rate of increase in prices" (*Bank of Canada Review*, Spring 1991, p 13). The Bundesbank have argued that the corridor takes due account of the limits to the technical accuracy attainable in pursuing quantitative monetary targets. But there is a clear cost to targeting ranges rather than points. Ranges minimise the chances of a breach and associated loss of credibility, but the larger the range chosen, the lower the benefit of committing to it, since it still leaves scope for discretionary behaviour.

Difficulties in Forecasting

Any forward looking assessment faces huge uncertainties, since the sources of possible error are many: model uncertainties, true structural shocks, mistakes in projecting exogenous variables, etc. Correspondingly, forecast errors, both official and private sector, are usually large. In this context, we must also address the issue of output price variability trade-off. Any reduction in inflation variability can only be bought at the expense of a considerable heightening of output variability. Empirical results suggest that the prospects of controlling inflation within a small margin of error are not good. Moreover, these inflation uncertainties are not primarily the result of policy-makers' ignorance of how transaction channel works. At least as important are unforecastable shocks to the inflation process whose effects are never be foreseen *ex-ante*, but which may nevertheless dominate the *ex-post* behaviour of inflation.

As in many inflation target countries, baseline projections are then modified in two important ways before influencing monetary policy decision-making. First sensitivity analysis is carried out, i e, projections are re-run based upon different assumed paths for the exogenous variable. This offers a guide to probable uncertainties around baseline projections. Second, 'off-model' information is brought to bear on the projections. For example, the monetary aggregates and policy-makers' judgment are used to inform the projection and the uncertainties surrounding it. The recognition of policy uncertainties in the design of monetary policies is well-known.

But the important point to recognise is that given the lags in monetary policy, the need to form a forward looking inflation assessment is inescapable. We recognise that inflation projections serve as a useful policy tool. Inflation targeting banks have recently sought to identify and quantify these uncertainties explicitly. As a result, mandatory policy in these countries are now set in a probabilistic fashion based upon the distribution of likely inflation outturns rather than just their mean.

Another reason for large *ex-post* errors in some years have been genuine shocks of the kind that no policy regime can easily cope with. Even with good forecast, shocks will occur which push inflation out of the target band *ex-post*, even though the central bank's unbiased expectation was that inflation would be in the centre of the band. In these circumstances, how quickly should the central bank try to return to its preferred inflation range is one of the key operational consideration for policy-makers. This depends to a large extent on the nature of the shock. In general, there are five shocks which can hit the economy: a shock to import prices, a shock to foreign output, a shock to the weather and a shock to the output and inflation not covered by first three channels. In the case where demand rather than supply shocks are prevalent, there may be relatively little real conflict between the price and the output objectives. However, where supply shocks occur, monetary policy can only dampen price stability by adding to short-term output variability so there is a short-term conflict between the two objectives. Even if primacy is given to restoring price stability, decisions could be made about the nature of the adjacent path that has to be sought. In general, the experience of inflation targeting countries clearly demonstrate that the exchange rate channel of monetary policy is well calibrated so that the impact on inflation is slightly less than the impact of policy via output channel over the targeted period.

In establishing any sort of public objective for inflation, a key question is what

variance of inflation can reasonably be expected to be achieved, given what we know about the nature of the shocks to which the economy is typically subject. While major identifiable supply-side shocks may be a sufficient condition for the suspension of a target, the regime needs to be sufficiently robust to handle more minor shocks of various kinds without being recast often, otherwise there will be loss of credibility.

Time Dependence in Inflation Targets

The UK's inflation target was initially time dependent. When inflation targets were first announced in New Zealand, they included a commitment to reach 0 to 2 per cent by 1992, 3 to 5 per cent by December 1990, 1.5 to 3.5 per cent by December 1991. Inflation targets in Spain, Canada and Mexico have all been similarly time dependent. There are reasons for time dependent targets. If the authorities know that monetary policy affects inflation with a lag, it makes sense to set different targets for the initial period from those for the period after the policy change has impacted the economy. Otherwise, the authorities risk losing face when they miss the target in the initial period itself. Another reason is concern about the speed of change in inflation and the consequences of disinflation for short run output levels. As observed by Sargent (1983), errors made in forming expectations about inflation make disinflation costly. Costless disinflations are those that are believed. Ball (1993) identifies episodes of disinflation in OECD countries and finds that fast disinflations imply lower real costs than do slow ones and in his words "cold Turkey is less costly than gradualism". Yats and Chapple (1994) find, using a sample of 43 countries, that this result is not robust.

The next question that we must address is should the inflation targets be defined in terms of annual or monthly or weekly prices. The importance of this is that the more volatile is the inflation rate used in the target, the more frequent and more severe will be the policy changes needed to keep it within target. Alternatively, defining an inflation target over a volatile higher-frequency will need larger ranges or more exemptions to make the target achievable with the same degree of probability as one defined on a lower-frequency inflation rate. The benefit of a high frequency inflation rate target is that it allows for more certainty about the price level from time to time. In general, a 12-month period has been found to be a reasonable one.

Instrument Instability

This refers to the need to swing interest rates and exchange rate around wildly in order to maintain the target. Instrument instability could create or exacerbate a trade-off between inflation and output variance. Instrument instability is a product of interaction between particular types of shocks, the power of policy instruments and the target band width/length. For example, in 1994, capital inflows generated by a positive shift in investors' sentiments towards New Zealand drove local interest rates very low, though the higher exchange rate associated with the capital inflow checked part of the stimulus to inflation, the direct component of the exchange rate effect is of shorter duration than the indirect interest rate effect. Further, the extent of exchange rate appreciation was limited by the need to prevent inflation falling sharply in the short-term. In general, instrument instability would be indicated by an increased variance of the real interest rate and real exchange rate consequent upon adopting a narrow inflation target band.

Credibility or Flexibility

Under inflation targeting, a major problem is that the central bank pre-commits itself to an objective which it cannot fully control. On the one hand, inaccurate knowledge about the structure of the economy, transmission mechanism of monetary policy and policy outcomes make it impossible to hit the target exactly and repeatedly all the time. When the target is missed, public cannot always be certain whether this is due to inflationary monetary policy or due to unforeseen developments beyond the control of policy-makers. On the other hand, the success of an anti-inflationary monetary policy depends on whether economic agents have faith in it. If the announced inflation target is not credible, it may be less effective in reducing the inflation expectation. Lack of commitment on the part of society at large to the anti-inflationary policy requires tighter monetary policy. Consequently adhering to the target may give rise to substantial adverse short-term output effects which could reduce the acceptability of the announced inflation target even further. Hence, the initial period of new policy regime constitutes a stringent test of the commitment and independence of the central bank.

The experience of various countries does not offer a clear and straightforward solution to accomplishing credibility for a low inflation monetary policy while allowing some flexible policy response to unforeseen contingencies and uncertainties. In this context, a discretionary monetary policy can result in an inflation bias without simulating output as indicated by Kydland and Prescott (1997). However, very strictly defined inflation target does not allow any flexibility in monetary policy which may introduce instability into the economy. In the absence of unforeseen supply shocks to the economy, rigid inflation targeting may work well since there is no trade-off with short-term output stabilisation. However, in the event of large adverse shocks from the supply-side, a rigid inflation target may work poorly by exacerbating the negative output effects induced by the shock. Hence some flexibility is preferable to either fully discretionary monetary policy or rigid inflation target [Rogoff 1985]. One solution to the dilemma between credibility and flexibility is the strategy of mixing a simple rule with discretion by announcing an inflation target with an escape clause as in Australia and Finland.

Transparency is another important aspect which lays the foundation for the success of inflation target. Transparency allows private sector agents to monitor and if necessary question the authorities' policy analysis and actions. This, in turn, increases the incentives for the authorities to get their analysis right Among countries with inflation targets, there is a spectrum of positions on policy transparency. For example, New Zealand and UK publish inflation reports and also minutes of regular meetings on monetary policy. The Bank of Spain also started publishing inflation reports and the Bank of Canada has been publishing its monetary policy report since 1995.

The UK was the only country other than New Zealand to publish regularly an inflation forecasting. Canada and Spain were both reviewing the publication issue but did not publish forecasts. However, the Riskbank made qualitative assessment of inflation prospects in its inflation report. Bank of Israel and the Reserve Bank of Australia both issued qualitative statement on the basis of their internal forecasts but did not typically put numbers to these. Finland did not publish any forecast.

III
Inflation Targeting and India

In India, stipulated annual variation in broad money is considered as an intermediate target under the monetary targeting framework and it acts as a domestic anchor for monetary policy with feedback. Though the exchange rate is not treated as an

anchor, exchange rate policy assumes importance considering the degree of our openness (share of exports and imports is at around one-fifth of GDP) and the implications for capital inflows.

In the April 1998 monetary policy a move towards indicators approach was announced, where the RBI takes into account the developments in a host of macroeconomic indicators such as money, credit, prices, etc, in the conduct of its monetary policy. The earlier approach, like the present one, took into account developments in various macro-economic parameters in monetary policy decisions. But now we formally recognise developments in other parameters also which would no doubt enhance monetary policy flexibility.

In spite of financial liberalisation since 1991, the demand for money in India is still a stable function of income and prices. Although interest rates turn out to be an important input in business and household decisions, statistically significant relationship is yet to be established for this variable in money demand function. Market integration is not yet complete although the number of instruments and institutional players in the market have increased considerably in recent period. All these factors strongly suggest that monetary targeting exercise through indicator approach is still an optimal one for India. Perhaps, at the end of the transition period, one may think in terms of putting in place inflation targeting approach. But before we move towards this the following aspects need special consideration.

There is a strong need for developing an inflation model for India and to clearly identify sources of inflation and preferably the share of each factor, at least in the form of some ranges. This analysis could be supplemented by quantification of the impact of various shocks on inflation. More importantly the role of supply shocks in the inflation model is to be duley captured and attempt must be made to delineate their contribution. Furthermore, we must also recognise the part played by administered prices. In this context it is important to quantify the role of government controls on various macro parameters and their impact on the general price level. This would help us to arrive at some idea about the 'underlying inflation'.

With regard to the price indicators to measure inflation, at present we are using WPI for measuring headline inflation which does not properly reflect the significant structural changes that have taken place in the last 15 years as the present WPI has 1981-82 as the base year. There is a need to update this index. Furthermore, consumer price index is also not broad-based, thereby rendering it less useful for policy purposes. In addition, in the last one year, the divergence between WPI and CPI is also increasing, which underlines the need to look into the components of various items which enter into these two price indices. Although GDP deflator is a preferred option, we do not have necessary expertise/information system on a monthly basis. In addition to these factors, we must also develop our expertise in preparing an inflation report and publish it to induce a public debate. This would enhance our credibility in future, once we take a decision to move towards inflation targeting. These actions will teach us the art of inflation forecasting.

In the recent period, one may find a number of references in India regarding interest rate targeting. Economic literature on this topic is scant since one of the basic objectives of financial sector liberalisation is to assign interest rates the central place and also to let the market determine them. Furthermore, inflation targeting is the ultimate objective of monetary policy and interest rates are no doubt intermediate targets. Hence we must examine the utility of interest rate targeting at the first stage and then moving to inflation targeting at a later stage.

Most of the countries, which are adopting explicit inflation targeting, have not passed through one full business cycle with this approach. Moreover, the average annual inflation rate in these countries during 1992-97 works out 2.5 per cent. However, the inflation rates in many economies, both industrial and developing, are at a lower level in the past four years than in the earlier period. It is not clear at this stage whether the lower inflation in countries which adopted the inflation targeting approach can be attributed to the targeting policy. This is not to undermine the positive features of this approach.

In setting the parameters of an inflation target, the choice is always between the benefits of announcing a target appropriate for the objective of price stability at all times and the benefits of credibility conferred by committing to a stringent regime. "If state of nature contracts were feasible and prevalent, we would not need money or monetary policy anyway" [Tobin 1983]. The inflation target is just such a contract and the variation in design across countries reflects the difficulties involved in planning for different 'states of nature' – boom, slump, oil price shocks, velocity shocks and forecasting errors – without losing face.

Regarding the relevance for India, perhaps we have to wait for another four to five years so that the financial sector reform agenda is accomplished, reasonably complemented by real sector reform. In the meantime we should also enhance our capacity not only in inflation forecasting but also in adopting various analytical means of controlling the inflationary expectations in the event of various shocks. In this context the experience of UK and New Zealand is very useful to us.

Experience with Monetary Targeting in India

Deepak Mohanty
A K Mitra

In India, the monetary targeting exercise produced mixed results. Notwithstanding the reasonable stability of the money demand function, the expansion of money supply emanating from monetisation of government deficit and in a more recent period from capital flows rendered the control of monetary aggregates difficult. With increasing market orientation of the financial structure and international capital flows, it needs to be pondered whether monetary targeting approach could ensure internal and external stability when the avowed objective of policy is to move away from a classical reserve money based monetary policy operating procedure by de-emphasising reserve requirements as active instruments of policy.

THE monetary and credit policy announcements for 1998-99 provided the initial, albeit hesitant, indication that targeting of money supply in the monetary policy operating framework may not necessarily explain the monetary and financial developments in the context of the innovations in the financial sector. Although the monetary and credit policy for the first half of 1998-99 had announced a broad money (M_3) growth target of 15.0-15.5 per cent, it noted that "... the financial innovations that have recently emerged in the economy provide some evidence that the dominant effect on the demand for money in near future need not necessarily be real income, as in the past". In this context, the idea of multiple indicator approach to policy formulation was mooted. The Reserve Bank's Annual Report for 1997-98 was unequivocal on this issue : ".... the Bank has explicitly preferred to adopt a multiple indicator approach wherein movements not only in money supply but also in a host of economic variables will be tracked for policy responses". The mid-term review of monetary and credit policy for 1998-99 announced in October 1998 while expressing serious concern over the strong money supply growth[1] did not refer to any formal money supply target. It is not unusual for a country to change its monetary policy framework, over time, given the changes that occur in its financial structure. Many countries, developed and developing, have traversed this path of monetary targeting to subsequently either completely abandon or deemphasise monetary aggregates in policy formulation.

Against this background, this paper evaluates India's experience with monetary targeting which was adopted in the mid-1980s following the recommendations of the committee to review the working of the monetary system (chairman: Sukhamoy Chakravarty) – popularly known as the Chakravarty Committee. This paper is organised in four sections. Section I gives a brief account of country experiences with monetary targeting which sets the tone for assessment of the monetary targeting experience in India in Section II. Section III provides empirical estimates of demand for money in India, the stability of which forms the core of any strategy of monetary targeting, and Section IV gives the conclusions of the paper.

I
Country Experiences with Monetary Targeting

The breakdown of the Bretton-Woods system of fixed exchange rates which provided a nominal anchor for monetary policy during the 1970s and acceleration in inflation in many developed countries provided the necessary background to the choice of money supply as a nominal anchor. In some developed countries such as the UK, Italy and France, monetary policy was 'accommodative' of the large and growing public sector deficit. It was viewed that monetary targeting would give monetary policy an autonomous character and that it would not be subservient to fiscal compulsions. In this section we focus on the targeting experience of nine developed countries, viz, Australia, Canada, France, Italy, Japan, Switzerland, the UK, the US and Germany (Table 1) and briefly touch upon the current practices in 20 emerging market economies (Table 2).

Experience in Developed Countries

The targeting experience of central banks of developed countries since the mid-1970s reveal broadly three distinct phases : a phase of monetary targeting till the mid-1980s, followed by a period of absence of targeting of any particular variable during the latter half of the 1980s, and to a preponderance of inflation targeting during the 1990s.

The institutional setting for many of these countries was characterised by quantitative targeting and directed credit during the 1970s. But the 1980s brought about significant changes by way of financial deregulation facilitating a shift to indirect instruments of monetary policy. The attendant changes in the institutional structure and financial innovations that followed contributed to a shift or weakening in the established relationship between the original aggregates chosen as the targets and nominal income and/or prices. Financial re-intermediation in some countries and dis-intermediation in others also brought about these changes. For example, re-intermediation resulting from the freeing of banks to set competitive interest rates, the permission to foreign banks and erstwhile non-banking financial institutions (NBFIs) to enter banking sector resulted in the instability in the demand for money in Australia with evidence of long-term structural shifts in its parameters during the mid-1980s. Consequently the Australian authorities abandoned monetary targeting in 1985 and instead assessed the appropriate stance of policy on the basis of a range of indicators.

On the other hand, financial sector reforms in France encouraged development of alternative financial assets and the effects of dis-intermediation was reflected in the sharp lowering of money growth after 1983. Consequently France, which had been targeting M_2 publicly since 1977, moved over to dual targeting of M_2 and M_3 from 1987 and to exclusive targeting of M_3 in 1990. Similarly, financial innovations like better cash management practices of enterprises, daily compounded interest on savings accounts since 1979 and checkable savings deposits since 1981 provoked flight from M_1 – the monetary target for Canada from 1975 leading to its abandonment in 1983. The reform in the government securities market in Italy whereby Banca d'Italia was freed from its obligations to purchase government securities in excess of market demand and

consequent sharp increase in real-interest rates contributed to dis-intermediation with the public increasingly subscribing to government debt directly. In view of the changed relationship between the development of credit and public's holdings of monetary assets in Italy, targeting shifted from total domestic credit to include targets for M_2 and credit to the private sector in 1985.

In the UK, monetary targeting experience was also not a satisfactory one as abolition of exchange controls and re-intermediation, facilitated by competitive interest rates on increasing proportion of deposits included in broad money, disrupted relation between M_3 – the monetary target since July 1976 – and nominal GDP in the early 1980s. Further, the sharp movements in asset prices, by inducing variability in money/income relationship, made successful broad money targeting virtually impossible. Consequently the UK switched to targeting M_0, which also proved increasingly unreliable, particularly since 1989 when the increase in velocity was inexplicable given the level of interest rates.

The US Federal Reserve which followed internal 'tolerance bands' for money and credit since 1970 publicly announced target ranges for monetary aggregates from 1975.[2] The effect of financial deregulation and innovation in the early 1980s such as introduction of negotiable order of withdrawal (NOW) accounts, super-NOW accounts, money market deposit accounts (MMDAs), and general spread of 'deposit sweeping'[3] blurred the distinctions between 'transactions' and 'savings' balances. With the shift in the traditional relationships between money, especially M_1 and nominal GNP, M_1 ceased to be a target since 1987. M_2, M_3 and credit targets recorded mixed achievements and the Fed looked more broadly than just at the financial aggregates in deciding the stance of monetary policy. Consequently, the role of monetary aggregates became more in the nature of indicators than intermediate targets.

The Bank of Japan began to focus internally on monetary growth around 1975 and in 1978 began announcing publicly quarterly 'forecasts' for money supply growth. The Japanese approach was, however, somewhat different from a strict adherence to a pre-determined money growth rule, and more in the nature of forecasts.

Switzerland set a fixed (point target) annual growth rates for the monetary base during 1980s but financial innovations and external sector compulsions contributed to a shift in emphasis to exchange rate targeting during the later part of the 1980s. But monetary targeting resumed in 1990 when the Swiss franc had recovered to its desired level.

As monetary targeting was adversely affected by instability of money demand functions during the 1980s, some of the countries surveyed switched to a strategy of direct inflation targeting. Countries like Australia (1993), Canada (February 1991), Finland (February 1993), New Zealand (March 1990), Spain (summer of 1994), Sweden (January 1993) and the UK (October 1992) switched to inflation targeting during the early 1990s in which explicit inflation targets are publicly announced.

In countries such as Germany, Italy and Switzerland, which have preferred to persevere with monetary targeting the strategy of monetary targeting stands diluted from the classical concept of reserve money based money supply. Recently, the Bundesbank claimed that monetary targeting has become considerably more difficult in the face of increased volatility of short-term money growth.[4] This has prompted the Bundesbank to emphasise the medium-term nature of its monetary policy in 1997-98; it extended the time horizon of its monetary (M_3) targeting to two years (1997 and 1998 at 5 per cent for each year) so as to contain "any potential uncertainties about the orientation of its monetary policy during that period".[5] Italy has continued to announce targets for monetary and credit aggregates during the 1990s but in recent years, the explicit reference to the anti-inflationary objective is an essential element of its present strategy although it does not implement a formal scheme of direct inflation targeting. Of the two intermediate objectives of the French monetary policy, domestic and external, latter is more binding in the short run which has led to a de-emphasis of monetary targeting in the sense that it has been assigned a medium-term objective. Although, Switzerland continues to use the monetary base as its intermediate target it reacts to unexpected developments like

strong fluctuations in the exchange rate and in the demand for money.

In the context of the European monetary integration, monetary targeting seems to have been finding some favour. The European Central Bank (ECB), which formally came into existence in June 1998 and will decide monetary policy for the 11 member countries from January 1999, has adopted two policy guides: (i) a monetary target or a 'reference value' and (ii) an inflation target range of 2 per cent or less.

In a majority of industrial economies where financial sector innovations and deregulation fostered integration of financial markets and cross-border flows of capital, the effectiveness of monetary targeting, the use of unremunerated reserves based operating procedure and direct credit controls diminished over time. Initial responses have been either to re-define their monetary aggregates and/or to move from a narrow to a broader definition of monetary aggregate (except for the UK) to accommodate the portfolio shifts. Even then, the monetary targeting experience, not being entirely successful in the sense of hitting the target or the target range (Table 1), these countries have tended to move, broadly since the mid-1980s, more in the direction of market operations and the use of interest rates to achieve monetary control

As far as the ultimate objective of monetary policy is concerned, inflation exhibited a substantial deceleration in most industrial countries (except for Italy and Canada) and the variability of inflation was also lower during the targeting period. It may, however, be noted that the implicit discipline of the fiscal policy, additional discipline of the European Monetary System (EMS) and the absence of any large commodity price shocks in the 1980s also contributed to a favourable environment of working of monetary policy. Hence, while, it may be concluded that monetary targeting coincided with declining inflation in most developed countries, the extent of decline contributed solely by the move over to intermediate targets of monetary aggregates is not very clear.

Practices in Developing Countries

While inflation targeting is regarded as the ultimate objective of monetary policy in the case of industrial countries, the debate on the extent to which price stability should be deemed to be the overriding objective of monetary policy continues in the case of developing countries.[6] While initially, inflation was viewed as endemic in the process of economic growth and a result of structural imbalances, it has become increasingly clear that in any process of growth which is financed by inflationary means, pressures on commodity prices are bound to ensue over time with the consequent deleterious impact on economic growth. Consequently, central banks began to put greater emphasis on price stability and many of them introduced monetary targeting, particularly when it was evident that the relationship between the monetary aggregates, aggregate demand and prices in the case of developing economies is not subject to such violent shifts as was evidenced in developed countries, possibly because of a lower order of financial innovations in the developing countries.

A survey of 20 emerging market economies reveals that increasingly fewer countries now rely exclusively on some form of monetary target. Monetary targeting is practised in Philippines which uses the base money as the main operating target. Indonesia seeks to achieve, since 1983, multiple objectives of monetary policy (growth, employment, inflation and balance of payments) through control of monetary aggregates (M_1 and M_2).[7] Peru sets intermediate targets for base money growth as an intermediate target because it could be more easily controlled by the central bank and because it was closely correlated with inflation. In countries like China and Russia, which have not witnessed substantial financial sector reforms, monetary targeting continues to be useful. M_2 and M_3 are intermediate targets in Venezuela and Malaysia, respectively. Both Brazil and Korea still formulate monetary targets, although they are only indicative and broadly defined given the volatility of money demand in recent years (Table 2).

II
Monetary Targeting in India

Following the recommendations of the Chakravarty Committee, monetary targeting approach was pursued in a formal sense in India since about the middle of the 1980s. Coincidentally enough, adoption of monetary targeting in the mid-1980s was in contrast to its general abandonment in a number of industrial countries. In India, however, the reasonable stability in the demand function for money with respect to a select set of variables,[8] administered interest rate structure and the absence of significant innovations in the financial sector and lack of large cross-border capital flows facilitated the adoption of broad money (M_3) as an intermediate target of monetary policy. The rationale for monetary targeting was espoused by C Rangarajan, former governor of the Reserve Bank as follows:

> Monetary aggregates as intermediate targets are appropriate for two reasons : First, since the money demand function for India has remained reasonably stable, it continues to be helpful in predicting price movements with reasonable accuracy at least over a period of time, say 3 to 5 years. Secondly, the money stock target is relatively well understood by the public at large. With the money supply target, the stance of monetary policy is unambiguously defined and gives a clear signal to market participants.[9]

However, Rangarajan cautions that India's is a 'far cry' from 'mindless monetarism' and that the monetary authority has to continuously monitor a range of aggregates and that the Reserve

Bank is not bound by a fixed rate of growth of money supply. Monetary targeting in the Indian context required to be much more flexible than that in some of the advanced countries which had a constant money supply growth rule and gave little discretion to the central bank. As the Chakravarty Committee argued, "In a developing country like India, where significant structural changes are sought to be achieved to facilitate the growth process, the mechanical application of a constant money supply growth rule can have no place." Monetary targeting in India took into account various feedbacks. Thus, not only an appropriate growth in money supply is estimated given the expected increase in real output and the acceptable level of price increases,[10] but the feedback of an increase in money supply on output increases through the availability of credit is considered.

The Reserve Bank also recognised that ensuring price stability through monetary targeting would be effective only if simultaneously, fiscal deficit, particularly, expansion of net Reserve Bank credit to the central government, which has accounted for the bulk of the creation of the reserve money (or monetary base) over the years, is contained within a reasonable limit. It was, therefore, clear from the outset that inflation in India was perceived not simply as a monetary phenomenon, but more importantly, a fiscal one.

It may be indicated that in a monetary targeting framework the focus of policy has been on the broad money aggregate (M_3)[11] and variations in the wholesale price index (WPI) is taken as the headline inflation. The setting of monetary targets and the actual achievements are summarised in Table 3. Although monetary targeting was adopted in the mid-1980s, it was not before 1991-92 that monetary targeting achieved its pride of place in formulation of monetary policy.

Pre-Monetary Targeting Period

The setting of monetary policy during the early 1980s, more often than not, used to be in the backdrop of an 'uncomfortably high'[12] overall growth of liquidity (M_3), "very large increase in reserve money" and a higher than desired rise in wholesale prices.[13] In such a milieu the thrust of the credit policy was to ensure credit to the

Table 3: Monetary Targeting – Target versus Achievement

Year	Objective/Target: M_3	GDP (per cent)	Inflation (per cent)	Actual (per cent): M_3	GDP	Inflation
1	2	3	4	5	6	7
1983-84	Containment of the overall liquidity growth to a rate lower than in 1982-83 i e, 16.6 per cent	--	–	18.2	8.3	7.6
1984-85	Growth of overall liquidity and primary money creation to be kept below that in 1983-84 i e, 18.2 per cent	-	Curb inflationary expectations	19.0	3.8	6.0
1985-86	Liquidity growth lower than that in 1984-85	Output growth of the same order as in 1984-85	Avoid resurgence of inflation	16.0 Target achieved	4.1	4.8
1986-87	M_3 growth to be contained below the high annual average level of the previous four years i e, 17.5 per cent	Output growth somewhat higher than in 1985-86	The rate of inflation should continue to be kept under check	18.6	4.3	5.1
1987-88	M_3 growth well below the expansion in 1986-87 i e, 18.6 per cent	5.0	Avoid re-emergence of inflationary pressures	16.0 Target achieved	4.3	10.7
1988-89	M_3 growth to be below the average for the previous three years i e, 16.9 per cent	-	–	17.8	10.6	5.7
1989-90	M_3 growth to be contained at a level lower than the average of the last four years i e, 17.1 per cent	4-5	-	19.4	6.9	9.1
1990-91	To bring about a sharp reduction of M_3 growth by about 4 percentage points over previous year i e, 15.4 per cent	Around 5.0	–	15.1 Target achieved	5.4	12.1
1991-92 (April)	To contain M_3 growth to 14.0[18] per cent	4.0	Max 7.0	19.3	0.8	13.6
1991-92 (October)	To contain M_3 growth to 13.0 per cent	3.0	Max 9.0			
1992-93	11.0 per cent M_3 growth (Max)[19]		8.0	15.7	5.3	7.0
1993-94	Around 12.0 per cent M_3 growth	5.0	Further moderation in inflation rate	18.4	6.2	10.8
1994-95 (April)	14.0-15.0 per cent M_3 growth	5.0	Sharp reduction in inflation rate by about 4 percentage points	22.3	7.8	10.4
1994-95 (October)	16.0 (Max) per cent M_3 growth	5.5				
1995-96	15.5 (Max) per cent M_3 growth	5.5	Around 8.0	13.7 Target achieved	7.2	5.0
1996-97	15.5-16.0 per cent M_3 growth	6.0	6.0	16.2	7.5	6.9
1997-98	15.0-15.5 per cent M_3 growth	6.5-7.0	5.0-6.0	17.6	5.1	5.3

productive sectors of the economy and assist in the fuller utilisation of the available capacities "without providing any support to the revival of inflationary expectations."[14] The major instrument of policy was the cash reserve ratio (CRR). But care needed to be taken so that the general liquidity tightening measures did not "hinder the seasonal flow of credit for supporting the utilisation of productive potential of the economy, and in particular the needs of the priority sector."[15] In case 'some banks' had "transient difficulties in meeting enhanced CRR" such banks were provided "discretionary refinance for short periods to enable them to undertake a smooth adjustment to the higher CRR."[16] The Reserve Bank also provided refinance to smoothen temporary mismatches between sources and uses of funds.[17]

The Reserve Bank announced its credit policy twice during a fiscal year and used to have periodic credit budget meetings with the commercial banks. Operationally, "since the growth of scheduled commercial banks" deposits is inherently difficult to forecast[20] the Reserve Bank used as a working estimate a targeted growth in scheduled commercial banks' deposits, distributed evenly between the two halves of the financial year and advised banks to plan their operations accordingly. It indicated to the major banks 'broad guidelines' for deposit growth and credit deployment in the credit budget discussions "after taking into account an assessment of the macro-economic aggregates".[21]

The Reserve Bank often expressed concern about the link between fiscal deficit and excess liquidity creation. This concern was also reflected in the Chakravarty Committee report which prompted the government to widen the definition of budget deficit so as to "better reflect the monetisation of the budgetary deficit".[22] The other major recommendation accepted by the government related to the introduction of monetary targeting. It was hoped that the acceptance of the wider concept of budget deficit and the introduction of monetary targets would result in greater co-ordination between monetary and fiscal policies. The Reserve Bank, however, in accordance with the Committee's report, recognised that "the interrelationships among output, money and prices are subject to complex lags" and that it was "difficult to set out the precise operations of these lags."[23] It, therefore, noted that the "link between money, output and prices cannot be viewed exclusively within a narrow time frame of a year"[24] although "the basic underlying inter-relationships nevertheless hold good over a period of time".

Monetary Targeting Period

Despite the formal acceptance of monetary targeting, it took a few more years to operationalise the monetary targeting framework. No specific monetary target was set during 1985-90 except for fixing a ceiling linked to the average growth of broad money (M_3) in the previous year(s). The rationale for fixing a monetary ceiling over this period was the continued overhang of excess liquidity prompted by the sharp increase in primary money creation and the continuing pressures on prices.[25] Hence, credit budgeting continued to be an important vehicle for moderating the pace of monetary expansion and ensuring that "adequate credit is made available for normal seasonal requirements, particularly for sectors where there is a step-up in industrial output". Further, credit policy 'as a short-term instrument' was kept under "continuing review and operated flexibly to ensure that it remains supportive of the twin objectives of growth and price stability".[26]

The stance of the credit policy continued to be by and large contractionary as overall liquidity expanded far in excess of what was considered necessary to support productive activity. The most important impediment to the introduction of monetary targeting was the fact that the Reserve Bank had no control over its credit to the central government which accounted for the major chunk in the creation of reserve money. The Reserve Bank could at best set limits on the secondary expansion through such instruments as changes in the cash reserve ratio (CRR) along with statutory liquidity ratio (SLR) and selective credit controls. In fact, the statutory ceiling on CRR having been reached in 1988-89, a statutory ceiling of an incremental non-food credit deposit ratio of 60 per cent was stipulated and the cost of refinance was linked to the credit expansion of a bank.[27] The Reserve Bank also varied the administered interest rates – deposit and lending rates – taking into account the liquidity situation and inflation expectations.

During the mid-1980s, the money market and government securities market were at their infancy and hence, indirect policy instruments were ineffective to influence liquidity. Although the Chakravarty Committee and the Working Group on Money Markets (1987) had emphasised on development of a proper institutional framework to facilitate active monetary policy operations, it was only since the early 1990s that significant steps were initiated to widen and deepen the financial markets.

Monetary targeting was actively pursued during 1990-98. Interestingly, the target ceiling for M_3 growth was gradually reduced from about 15 per cent in 1990-91 to 11 per cent in 1992-93 and then raised progressively to 15.5-16.0 per cent in 1996-97; the rise reflected the increase in the expected rate of real GDP growth. However, the explicit use of the term 'monetary target' in monetary policy formulation first finds mention in the Bank's Annual Report 1991-92: "The key macro-economic assumptions underlying the monetary targets for 1991-92[28] were a real GDP growth of 3 to 3.5 per cent, an inflation rate of not more than 9 per cent, and a significant slowdown in M_3 expansion to about 13 per cent"[29] However, the actual M_3 expansion at 19.3 per cent was wide of the target, attributable to the domestic expansion of primary liquidity and the larger-than-projected foreign exchange accruals.

Monetary targeting for 1992-93 was based on the reduction of the monetised deficit (net RBI credit to the centre) which was "consistent with the government's declared objective of reducing the gross fiscal deficit from 6.5 per cent of GDP in 1991-92 to 5.0 per cent in 1992-93"

Moreover, since it was agreed that the "monetised deficit should be moderated throughout the year and not merely at the end of the year", the Reserve Bank considered it to be 'possible to bring monetary expansion (M_3) from 18.5 per cent in 1991-92 to less than 11 per cent in 1992-93"[30] which would contain inflation without undermining the revival of economic activity and boost exports in order to alleviate the problem of the external payments deficit.

The year 1992-93 was a landmark in that there was a concerted effort to move from direct to indirect instruments of monetary control and to develop an adequate institutional framework to facilitate an active secondary market in government securities. With the auction process generating market related – if not market determined, rates of interest, government borrowing ceased to be a tax on the banking system. The Reserve Bank, however, drew a note of caution: "If the borrowing requirement is excessive, under a market determined interest rate system, the rate of interest would move up to such high levels that the entire programme of reform becomes counter-productive as there could emerge a vicious spiral of rising interest rates and growing fiscal imbalances."[31] The Reserve Bank also announced its intention to reduce statutory liquidity ratio (SLR) and cash reserve ratio (CRR). This resulted in a decline of pre-emption of resources from the banking system from a peak of 63 per cent in early 1992 to 35 per cent in the following six years. There was a concomitant deregulation of interest rates. The objective of collapsing the multiple slabs of lending rates to two slabs was realised in October 1997 and term deposit rates were completely freed.

During 1993-94 and 1994-95, the growth in M_3 was wide-off the target.[32] In 1995-96, it was deemed possible to contain M_3 growth within the projected increase (of 15.5 per cent). A successful monetary targeting was, unfortunately followed by the "sharp criticism that growth (had) been impeded by a restrictive monetary policy which gave primacy to price stability".[33] The Reserve Bank defended its monetary policy stance by arguing that while monetary policy ensured a substantial decline in inflation in 1995-96, real GDP recorded a high growth of over 7 per cent.

In all the four years of success in monetary targeting, the rate of expansion in broad money was lower than that of the trend rate of growth of 17.3 per cent since 1970-71. The years of success were immediately preceded by years of sharp increases in money supply (Table 3). The first three years (1985-86, 1987-88 and 1990-91) of success in monetary targeting were accompanied by a lower rate of expansion in both net Reserve Bank credit to the central government and net foreign exchange assets of the banking sector. Inspite of higher expansion of net Reserve Bank credit to the central government, the fourth year (1995-96) of success was rendered possible due to substantially lower expansion in net foreign exchange assets of the banking sector.

Monetary targeting was most firmly espoused in the Bank's *Annual Reports* of *1995-96* and *1996-97* wherein the procedure followed in monetary targeting was also discussed. The *Annual Report 1996-97*, however, also noted that the context of monetary policy has undergone a distinct change in recent years with the opening up of the economy and with monetary policy initiatives increasingly directed towards maintaining a stable financial environment in relation to price, interest rate and exchange rate. The *Annual Report 1997-98* took this argument one step further by pointing to the experience of the developed countries where, following the financial innovations and sharp reductions in transaction costs, variations in quantity aggregates could no longer explain appropriately the variations in aggregate demand and prices which prompted these economies to target instead the rate variables like short-term interest rates or the exchange rate, and sometimes even more directly, the inflation rate.

III
Stability of Demand for Money

Monetary targeting is premised on a stable demand function for money. Under this approach, the demand for money is estimated given a real GDP target and inflation objective under the assumption that income velocity of money is stable. Another important consideration is the controllability of the monetary aggregate which is the object of policy. In the case of targeting of broad money which represents the liabilities of depository institutions, money supply could be endogenous. Although the central bank influences the money creating activities of these depository institutions in a fractional reserve system, this is not the same as the central bank being able to target money stock exogenously.

In the Indian context a number of empirical studies on the demand for money have demonstrated that it is stable (Vasudevan (1975), Jadhav (1994) and Arif (1996)). Several methods are available to assess stability. The Working Group on

Money Supply (Chairman: Y V Reddy) which submitted its report in June 1998 had used recursive estimation procedures of cumulative sum (CUSUM) and cumulative sum of the squares (CUSUMSQ) to assess the stability of the money demand function for India. These procedures are particularly useful in detecting structural changes. While the Working Group did not find evidence of parameter instability for the period 1970-71 to 1996-97 it recognised that the predictive stability of the money demand equation is equally important for its use for policy purposes. This is an issue which was earlier addressed by the most influential paper on money demand in India by C Rangarajan. In his presidential address at the 71st annual conference of the Indian Economic Association in December 1988, Rangarajan demonstrated that money demand equations provide reasonable predictions of average changes in prices over a horizon of four-five years, though not necessarily in a year to year context. In his D T Lakdawala Memorial Lecture in February 1994, Rangarajan revisited the same issue and came to similar conclusions. In essence the concern was with the long-run stability of the money demand function in terms of its most proximate determinant i,e,real GDP,[34] rather than its short-term behaviour.

In what follows we consider a fairly long time series to examine the long-term stability of the money demand equation. The Ordinary Least Square (OLS) estimation of logarithm of broad money in real terms (lbm) on logarithm of real GDP (lgdp) on the basis of annual data for a 46-year period from 1952-53 to 1997-98 yielded an income elasticity of demand for money of 1.58. While the equation gave a very good fit, expectedly it had high standard error and residual serial correlation. When corrected for first order residual serial correlation (Cochran-Orcutt method), the income elasticity at 1.55 did not change significantly. The maximum likelihood estimation with 3-year moving average error term (which in a way mimics the methodology suggested by Rangarajan) did not change the income elasticity significantly (Table 4).[35]

As regards the question of stability while CUSUM, recursive least square (RLSQ) and rolling least square with a window size of five years showed parameter shifts, these tests did not point to parameter instability. However, CUSUMSQ test pointed to deviation from the conventional 5 per cent critical bonds starting from mid-1980s coinciding with the period marking the monetary targeting exercise in India (Charts 1.1 to 1.4).

The mixed evidence on parameter stability notwithstanding, the above estimation would not stand the scrutiny c time series analysts keeping in view th fact that many macro-economic time seric are not stationary in their levels and mor adequately represented by first difference: In such, a scenario the long-run equilibriur relationship is best represented by cc integrating vector(s). The Augmente Dickey-Fuller (ADF) tests on the chose variables, viz, lbmr and lgdpr revealed th: these variables are I(1) on level form an I(0) in first difference Test of cc integration following the Johansen metho revealed the presence of a single cc integrating vector between real broa money and real GDP pointing to a long run equilibrium relationship (Table 5). Th estimated long-run co-integrating vectc with regard to real GDP worked out to 1.1 (Table 4). While the co-integrating vectc cannot be interpreted as the long-ru demand for money,[36] it is consistent wit the estimates of long run income elasticit estimated from the OLS equations.

Keeping in view the long-run equilibriur relationship we examined the predictiv stability. In this regard we chose the yea

1993-94 as the benchmark[37] to generate out of sample forecast from the variants of money demand equations discussed above. It could be seen that the predictive performance of the equations as measured by the root mean sum of squares predictive error (RMSPE) gradually improved from that in the OLS regression to the co-integrating equation (Table 4). The RMSPE improved from 5.21 per cent in[38] OLS regression to 3.26 per cent with 3-year moving average error term and to 2.05 per cent in the co-integrating equation. Even though the co-integrating equation sharply improved the predictive performance it could capture only one of the turning points during 1993-94 to 1997-98 (Chart 1.5).

IV
Conclusions

The international experiences with regard to monetary targeting suggest that the developed countries pursued such an approach to monetary policy formulation for about a decade and half with varying degrees of success. If success were to be judged by the number of years in which the monetary targets were achieved, there were more failures. In terms of the overall objective of monetary policy, the inflation rate in these countries came down during the targeting period. This achievement, however, could not be entirely attributed to monetary targeting exercise. Even those few developed countries which still persevere with monetary targets, tend to follow a more eclectic approach to monetary policy formulation. As regards developing countries, increasingly less number of countries pursue a purely monetary targeting approach. The move away from the monetary targeting approach was largely prompted by market oriented financial sector reforms and international capital flows.

In India, the monetary targeting exercise produced a mixed result during the 13 years (1985-98) when some form of monetary target was pursued. During this period, it is only on 4 occasions that the monetary targets could actually be achieved. The average growth of broad money, however, increased from 17.1 per cent during the decade and half (1970-85) preceding the monetary targeting period to 17.4 per cent in the monetary targeting period (1985-98). Furthermore, there was no perceptible improvement in the inflation rate which fell from an average of 8.8 per cent to 8.1 per cent during the same period, although the variability of inflation came down significantly. It may, however, be noted that the 1970s had witnessed two bouts of high inflation emanating from oil price shocks. As regards, output performance, the average real GDP increased sharply by 5.8 per cent per annum in the targeting period as against 4.0 per cent in the earlier period.

In view of the persistence of excess liquidity, containment of overall liquidity (measured in terms of M_3 growth) was the overriding objective of policy. The monetary targets, therefore, were initially framed in terms of setting of indicative ceilings on the basis of observed growth in the previous years. Interestingly, such ceilings preceded the Chakravarty Committee and continued till 1991-92 when M_3 targets were set independently. In the 1990s the monetary targets were set either as point targets or in a narrow range implying a higher probability of missing such targets. It may, however, be noted that a wider range puts a question mark on credibility, nullifying the very objective of targeting.

The pressures on monetary expansion in the earlier part of targeting exercise emanated from monetisation of fiscal deficit and later on from capital inflows. During the period 1985-1992, net Reserve Bank credit to the central government accounted for over 96 per cent of monetary base which was reduced to about 65 per cent in the subsequent period during 1993-1998 with corresponding increase in net foreign exchange assets of the Reserve Bank. In the event of a conflict between the liquidity impact of capital inflows and adherence to monetary target, the former seems to have taken precedence: "Since the inflows of foreign exchange were of overriding priority, measures of sterilising the inflow of these resources were not undertaken lest the measures should dampen such inflows."[39] In the absence of restraint over capital inflows, the success of monetary targeting became contingent on fiscal adjustment. Although the practice of automatic monetisation of the budgetary deficit was done away with effective April 1997, it is yet premature to judge its overall impact on liquidity in view of the Reserve Bank's support to the central government's market borrowing programme.

Thus, notwithstanding the reasonable stability of the money demand function, the expansion of money supply emanating from monetisation of government deficit and in more recent period from capital flows rendered the control of monetary aggregates more difficult. Moreover, the stability tests on the empirical estimates of money demand equation are sensitive not only to the choice of the time period but also the empirical methods. While a stable money demand function could be a necessary condition for monetary targeting, it may not always be an adequate guide to the choice of an optimal monetary policy framework. In an administered interest rate and exchange rate regime, the quantum channels dominate in transmission of monetary policy impulses. However, external and financial sector reforms enhance the sensitiveness of quantity variables to their market-determined price, i e, interest rates and exchange rate.

With increasing market orientation of the financial structure and international capital flows monetary policy would necessarily have to respond to developments on a continuous basis. In such a milieu, it needs to be pondered whether monetary targeting approach could ensure internal and external stability when the avowed objective of policy is to move away from a classical reserve money based monetary policy operating procedure by, de-emphasising reserve requirements as active instruments of policy. In India, the switch-over to a new monetary operating framework based on multi-indicator approach from the one predominantly based on targeting money supply would obviously give rise to lot of debate. In this context, Vasudevan (1997 and 1998), provides illuminating discussion on dilemma faced in monetary policy making in a transitional setting. It would, therefore, be more meaningful if the debate looks beyond the issue of stability of the money demand function in judging an appropriate framework of monetary policy for India.

Notes

[The authors are grateful to A Vasudevan for his valuable suggestions The views expressed in this paper are those of authors and not of the institution to which they belong]

1 On a year-on-year basis, M_3 growth (October 9, 1998 over October 10, 1997) was 20 6 per cent (and excluding Resurgent India Bond (RIB) receipts, 18 3 per cent) as against 16.8 per cent in the comparable period of the previous year.

2 The Fed opted for multiple targets, with ranges for growth in M_1, M_2 and M_3, as well as a measure of credit, being announced However, M_1 was the focus of attention

3 Automatic, often daily, transfers between transactions and investment accounts

24 *RBI Annual Report 1987-88*, p 75.

25 Credit Planning Cell Circular dated March 27, 1989

26 Credit Planning Cell Circular dated October 25, 1985

27 RBI Annual Report 1989-90, p 33.

28 These targets were revisions of the earlier targets set in April; the rationale for revision is given in Credit Planning Cell circular of October 8, 1991 "Given the strong inflationary pressures in the economy and the anticipated slowdown in the real GDP growth rate, there is an imperative need to bring about a significant slow-down in the real GDP growth rate, there remaining period of 1991-92"

29 The Credit Planning Cell circular of October 8, 1991, however, is not explicit about whether M_3 growth postulated was a target or a projection. It goes thus: "keeping in view the actual inflationary trends and since the underlying objective of policy is to bring about a sharp reduction in the inflation rate, it is desirable to work towards a lower M_3 expansion of about 13 per cent in 1991-92"

30 *RBI Annual Report 1991-92*, p 8. The rate of expansion of M_3 was, however, substantially higher at 19.3 per cent.

31 *RBI Annual Report 1992-93*, p 115.

32 The M_3 growth figure for 1994-95 is distorted by 27 reporting fortnights – two of which depicting year-end bulges of banking aggregates (March 18-April 1, 1994 and March 17-31, 1995) The inevitability of the distortion may not have been taken into account while formulating monetary target for 1994-95.

33 *RBI Annual Report 1995-96*, p 92.

34 In estimation of reduced form money demand equations, apart from a scale variable such as GDP, interest rates denoting opportunity cost are used as important arguments. In the Indian context there is no satisfactory measure of opportunity cost in view of long periods of tight interest rate regulations. Moreover, in the Indian context various measures of interest rates are not found to be statistically very significant.

35 The data set is given in Table 6.

36 Dickey, D A, et al

37 The choice of the year 1993-94 was conditioned by the fact that it marks the beginning of significant reforms in the external, financial and monetary sectors.

38 *RBI Annual Report 1991-92*, p 7.

On Interest Rate Policies

Romar Correa

The context in which the subject is treated is the different institutional arrangements that are being contemplated worldwide. Institutions, for the present purpose, are defined as outcomes of the strategic interaction between members of the private sector and the monetary authorities.

In a generalisation of the credit transmission approach we consider an aggregate monetary economy consisting of three agents: a firm, a bank and a household. The relationship between pairs of them is characterised by bilateral private information. Bonds, loans and savings are contracts in the level of output, the rate of interest on bonds, loans and the deposit rate. It is shown that the contracts have a common functional form.

This renders the model dynamically unstable. We consider the potentially stabilising role of monetary policy in two cases. In the first, the monetary authority operates the discount window. Formally, we introduce a parameter in the objective functions of the private sector agents. In the second, the central bank enters as a player with the interest rate on government paper as a strategy.

We examine the relative merits of the two policy regimes.

I
Introduction and Motivation

THERE is an animated ongoing discussion about optimal monetary regimes. These monetary arrangements concern different relationships that might exist between private sector agents and Central Banks. The various positions can be regarded as points along a spectrum. At one extreme are advocates of frameworks like those of 'free banking' that would assign a role to Central Banks that is minimal tending to zero. The basis for such arguments must ultimately rest on the desirable properties of an Arrow-Debreu model of the economy. Since the focus of this essay is the dynamic stability properties of different organisational forms, it is important to recall that for the dynamic stability of that model it is both necessary and sufficient that behavioural responses are known and are of a particular kind. In addition, there remains the enduring research agenda of satisfactorily incorporating money and finance in that framework.

As soon as we move away from this endpoint of the continuum, the essentially monetary nature of the modern economy has to be faced squarely [Cartelier and Froeschle 1989]. The acquisition of commodities is not the ultimate objective of agents in a capitalist economy. They seek to earn a surplus of revenues over costs. While utility maximisation might exist, profits are the social measure of economic performance. Profits of firms, in a familiar macro-economic identity, are equal to investments plus the government deficit. It is necessary therefore to conceptualise the modern economy as a policy regime in which the laws governing money, credit and contract are "part of a game embedded within a larger game" [Shubik 1984:5]. Institutional detail has to be filled in. The order of moves has to be specified. In order to define the payoffs in all disequilibrium states, rules concerning bankruptcy and so on have to be spelt out. Special agents like commercial banks with constraints concerning the distribution of their profits have to be introduced. A special player, an arbiter of the club of commercial banks, with a distinguished strategy set will exist. Monetary systems are social organisations which evolve through a process of invention and innovation. Economic policy can change the contours within which private sector choices are made. Temin (1990), arguing along these lines and drawing on the work of Thomas Sargent suggests that monetary history might not fruitfully be examined as the outcome of macro-economic policies divorced from the institutional context in which they are embedded. The particular illustration provided is the establishment of new policy regime by Roosevelt in 1933. The previous Hoover regime had been financially conservative, adhering to the rules of the gold standard and fiscal orthodoxy. Roosevelt abandoned this policy package, devaluing the dollar and extolling the virtues of inflation. The rules of the game were changed. In the new dispensation, government was under an implicit contract to determine the money supply, expenditure and the exchange rate. Expectations and actions sharply altered to a state of euphoria in response to what was perceived as long-term government policy.

The financing arrangements in a modern economy, by definition, involve borrowers and lenders. The proximate lender to an owner of capital assets and investing units is a financial institution. Borrowing and lending are also used by households to finance spending and asset acquisition. Asset-holders will shift between assets on the basis of interest-rate relativities. The relative own rate offered by each unit is not subject to the control of the monetary authorities. The authorities can at best indirectly influence these own rates by operating on the general level of interest rates [Goodhart 1991]. In that case, and with the financial innovations of recent times, the elasticity of substitution in the form of speed and responsiveness of these shifts increases. Firms, in their turn, may switch banks as a strategy for bargaining for lower interest rates over the cost of funds. Users of financial services cannot, without considerable cost, discriminate between alternative banks with different risk-return profiles. Depositors can withdraw their funds at will and hold cash. Alternatively, as in the case of bank runs in recent history, depositors might exit from banks perceived as an inferior outlet to alternatives. Since bank assets consist mainly of loans to firm, banks experiencing a shortfall of cash are forced to curtail lending and perhaps call in existing loans. As a consequence, businesses are compelled to seek alternative avenues of finance. Thin secondary markets imply that banks will be threatened with capital losses if they collectively attempt to sell out a part of their position. The only optimising strategy for such institutions is to stall a run-off of their deposit liabilities, that is, to refinance rather than sell out their position. In order to accomplish this they must meet market competition on a continuous basis. Minsky (1982, 1986) has proposed a framework in which all agents in a modern economy are usefully regarded

as 'banking units'. Households, corporations, as well as banks, finance positions in assets by emitting liabilities. At the same time, every unit must have a normal cash flow from operations. Like banks, all units must be liquid and solvent. According to the traditional precepts of banking, the liquidity and solvency of banks was ensured by self-liquidating commercial loans. In an identical fashion, on the part of firms, the payment commitments on debts must lie within bounds dictated by realised and expected cash flows. The relation between the cash flow and the commitments embodied in liabilities determine the conditions under which units can be placed in financial distress. The closer the articulation between the contractual and normal cash flows from a unit and its cash receipts, the smaller the domain of stability of the financial system

There is no particular premium to be attached to banks in this process of financial positioning. Households can purchase a diversified set of assets identical to a bank. The standard rationale that runs in terms of economies of scale and safe-keeping services does not apply as these can be obtained by investing in a collective investment fund. The modern explanation runs in terms of the asymmetric information that characterises the relationship between pairs of agents. Individuals will not have the time and expertise to monitor the behaviour of firms. Banks are alleged to have an informational advantage in this regard. It remains true, however, that both banks and savers will be at an informational disadvantage compared with the borrower, in assessing the latter's net worth. It seems reasonable therefore to assume that a 'veil of ignorance' prevails in financial contracting and conditions of bilateral private information best describe the relationship between pairs of agents. While the true asset value of the bank's (non-marketed) loans is uncertain, their nominal value is fixed. For this reason both banks and depositors will denominate deposit liabilities in fixed nominal terms. This is a superior arrangement for banks because the common denomination will reduce the risk arising from the reduced covariance between the value of its assets and its liabilities. The depositor would demand fixed nominal deposits from the bank for the same reason that the bank demands fixed nominal terms from borrowers. Depositors cannot, without considerable costs, know the true conditions and prospects of their bank. The incentives for banks not to shirk are increased by denominating deposits in fixed nominal terms. However, the combination of the nominal convertibility guarantee along with the state of ignorance regarding the true value of balance sheets lead to the possibility of bank runs and a systemic crisis.

The primary cash flows that validate household, business and government debt come from profits. The level of profits, in its turn, determines the debt structure that businessmen, their bankers and households, the ultimate holders of the assets of an economy, will accept. Profit expectations determine the level of investment which is ineluctably founded on uncertainty. Due to this fundamental uncertainty, investors and their financiers seek asset and liability structures that are hedges against unfavourable states of the world and adjust their portfolios continuously towards that end. Time is calendar time and cannot be captured by the device of dated commodities. 'News' variables can sharply change the relative prices of various capital assets and financial instruments as well as the relation between capital-asset prices and the price of current output. A classical dichotomy does not hold. Prices must fulfil not only their resource-allocation and output-rationing functions but also ensure that obligations on business debt are met.

In sum, the close articulation between what Knodell and Levine (1984) call the financial circulation and the industrial circulation make the system more crisis-prone. Movements within the industrial sector centre on conditions of profitability which involve long-term considerations. The process of production and of investment entail a time dimension that is distinct from the time dimension of a crisis. The financial circulation, on the other hand, is not linked to a calculation of profitability based on commodity production, nor is the time dimension of the financial circulation constrained by the period of production and investment. The term crisis connotes a process in which decisions are reinforced or reversed and in which these decisions are made with an expectation of their reversal and an immediate test of their value.

It was observed earlier that for the stability of a Walrasian multi-market system, a substitution principle must apply. Demand curves must be negatively slopped. However, because of the peculiar nature of financial economies, it is difficult to disentangle preferences from expectations [Minsky 1982, 1986]. This is the outcome of the pervasive uncertainty and conjectural elements that characterise modern economies. Agents choose assets and liabilities in a portfolio. Uncertainty impacts on portfolios. Each economic agent has a preference system that describes her aversion to uncertainty. These tastes are affected by observed payoffs. In other words, the curvature of a utility-income preference schedule is not given but the product of economic outcomes. It is possible, for example, that a rise in the relative prices of some subset of financial instruments may increase the quantity demanded of such assets. A rise in prices may then generate conditions conducive to another rise and so on.

We proceed with a consideration of policy regimes that can be set in place to reduce uncertainty. In the first case, it is worthwhile to recall that the discretionary policy functions of central banks came after their primary micro role of attending to the stability of individual members of the commercial banking system [Goodhart 1991]. In the pursuance of this objective, Central Banks lend at the discount window as an ultimate source of liquidity for the economy. If normal operations entail banks borrowing at the discount window, then the capital adequacy and asset structure of banks will be under Central Bank supervision. Open-market operations are the means by which Central Banks finance government activities. On the other hand, when the Central Bank supplies reserves through the discounting of to-the-asset short-term business debt, it is cofinancing business. The issue of short-term paper is linked to the ownership of business inventories. As loans fall due and are repaid, bank reserves are depleted. In order to replenish these reserves, banks would have to discount paper and there would be an ongoing relationship between banks and the central bank. The role of the Central Bank ensures that the paper would have a preferred status in financial markets. In the present case, the interest rate set by the Central Bank for its lending operations is an important determinant of the financing terms commercial banks can offer. Although the supply of reserves is infinitely elastic to all holders of this paper, the interest rate is fixed by the Central Bank on the basis of economywide considerations. In the words of Goodhart (1991), Central Banks are "non-competitive, non-profit-maximising agents" in this function.

The role of Central Banks as competing with the private sector to maximise the public deficit over the cost of securities came after the function outlined above. It remains true, as Goodhart (1995) reminds us, that monetary variables are statistical abstractions and monetary authorities are

concerned with ultimate objectives like output, employment and price stability. Nominal incomes are influenced by fiscal as well as monetary policy. Indeed, when Central Banks were founded they were not meant to fulfil the exclusive objective of price stability. Instead, they were established by governments as the first among equal commercial banks with special privileges provided them in the original charter. As the main Central Chartered Bank, they were bankers to the government. In periods when the government was unable to finance the deficit, Central Banks were expected to make additional loans available. The 'authorities' were loosely conceived to be both monetary and fiscal authorities. The objective of the authorities was to manage demand to achieve domestic full employment. To that end they might deploy either fiscal or monetary instruments. Indeed, governments have been largely responsible for preventing fragile structures into unravelling into full-fledged crises and deep depressions. Governments sustain demand and feed secure assets into portfolios whenever there is a fall in income and employment. They provide stability through the impact of deficits as a contracyclical policy to stabilise profits.

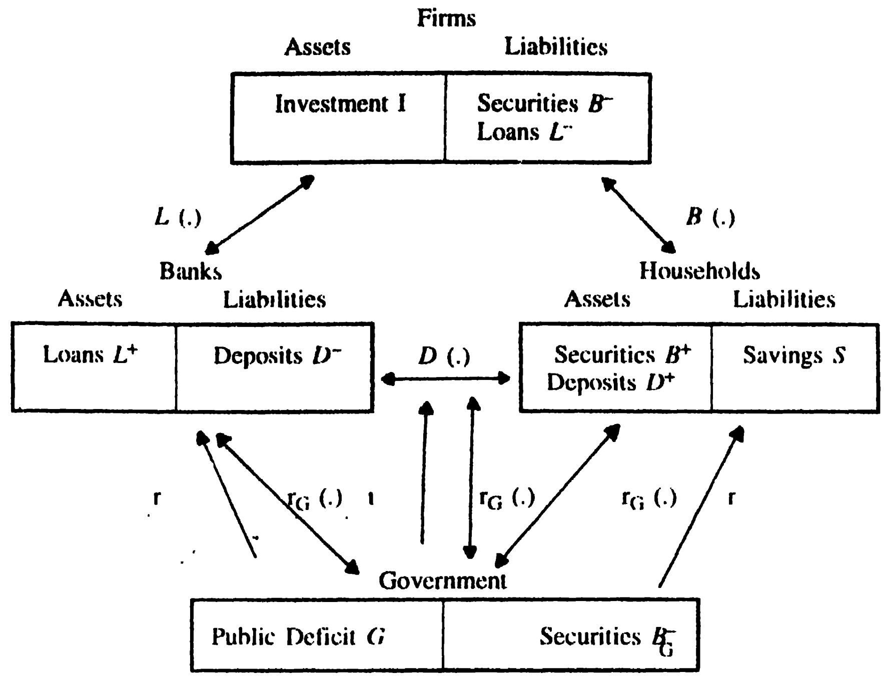
We proceed to validate these conjectures below. In the first place, we show that a private sector economy with profit-maximising agents is dynamically unstable. We introduce the authorities in turn as operating the discount window and as agents optimising a profit function. The properties of these two policy regimes are compared. A final section is a summary.

II
The Main Results

The financial decisions of agents are represented in a generalisation of a diagram from Freixas and Rochet (1997: 9). The subscripts F, H, B and G denote a representative firm, a representative household, a representative bank and the government respectively. All agents behave competitively. The superscript + represents a supply and the superscript − represents a demand.

We generalise the credit view of the transmission process by relaxing the assumption that bank loans are an imperfect substitute for bonds. As suggested, there is no primacy to be attached to the bank-borrower relationship in the process. The credit view can be described in the following way [Freixas and Rochet 1997]. The standard model is a world with one good and three assets (money D, bonds B and loans L). The real income of

Contracts in (r_L, r_D, r_B)



households, y, the interest rate on bonds, r_B, and the interest rate on deposits, r_D determine savings which are allocated between the two assets:

$$\underset{}{S}\,(\underset{+}{y},\underset{+}{r_D},\underset{+}{r_B}) = B^+(\underset{+}{y},\underset{-}{r_D},\underset{+}{r_B}) + D^+(\underset{+}{y},\underset{+}{r_D},\underset{-}{r_B})$$

The possibilities for investment financing by firms is given by

$$I(\underset{-}{r_L},\underset{-}{r_B}) = L^-(\underset{-}{r_L},\underset{+}{r_B}) + B^-(\underset{+}{r_L},\underset{-}{r_B})$$

Banks issue deposits and make loans so that

$$L^+(\underset{+}{r_L},\underset{-}{r_D}) = D^-(\underset{+}{r_L},\underset{-}{r_D})$$

Equilibrium on the money market is given by

$$D^+(\underset{+}{y},\underset{+}{r_D},\underset{-}{r_B}) = D^-(\underset{+}{r_L},\underset{-}{r_D})$$

while the IS curve is given by a system of two equations

$$I(\underset{-}{r_L},r_B) = S(\underset{+}{y},\underset{+}{r_D},\underset{+}{r_B})$$

(equilibrium on the goods market) and

$$L^-(\underset{-}{r_L},\underset{+}{r_B}) = L^+(\underset{+}{r_L},\underset{-}{r_D})$$

(equilibrium on the credit market).

The profit functions of the three agents are

$$\pi_F \equiv pf(I) - L^-(r_L,., r_B) - B^-(r_L,., r_B)$$
$$\pi_B \equiv L^+(r_L, r_D,.) - D^-(r_L, r_D,.)$$
$$\pi_H \equiv B^+(., r_D, r_B) + D^+(., r_D, r_B)$$

where f(I) denotes the production function of the representative firm. The following observations on this game are germane to the discussion. The inclusion of additional elements like the purchase of bonds by banks or indeed more agents will not alter the *structure* of the game. The game is 'almost perfectly antagonistic' in the following ways. A coalition of all the players will attain the payoff pf(I). This is a vindication of the argument made above that the utilities of all players in a capitalist economy are maximised by maximising the non-constant sum, the value of investment. Profits are apportioned among the bank and the household. An investment project involves two sets of interlocking decisions on the part of the firm. One set involves the revenues expected from using the capital asset in production. The second deals with financing the capital asset. The cost of financing the production of investment enters the supply price of output just like the cost of labour and material inputs. The ability to debt-finance new investment depends on expectations that future investment will be high enough so that future cash flows will be adequate to fulfil contractual commitments to bankers and households. Such a regime is particularly vulnerable to changes in the pace of investment for investment determines the viability of debt structures. The instability of such an economy is the consequence of the subjective nature of expectations of the future course of investment held by businessmen and the subjective nature of the appropriate liability structures held by businessmen, bankers and households.

The game has a saddlepoint in the following sense. Assume that coalitions

IF YOU DROP INTO DENA BANK, YOU WILL EXPERIENCE A NEW COMMITMENT TO SERVICE.
D ON'T MISS OUR NEW SYMBOL TOO!
While maintaining its age old values, Dena Bank has also consistently kept abreast with the latest banking technologies. This is perfectly encapsulated in the new symbol of Dena Bank The Goddess Laxmi, symbolising prosperity, smoothly merges with 'D D for Dena D for a new dedication To discover Dena Banks commitment to quality banking and exemplary service, drop in at any of its over 1140 branches Incidentally dont miss the new symbol too
THE FUTURE IS BRIGHT
WHEN THE SAVING IS RIGHT
SAVE WITH DENA BANK

R K SWAMY/BBDO DB 349

of two players can be formed. In that case for players i,j and k, we have

$$\pi_i + \pi_j = pf(I) - \pi_k.$$

Furthermore, it can be seen that the game is essential, that is, coalitions of two players are both necessary and sufficient to increase payoffs. The joint outcome is not less than what the players would have earned if they functioned non-cooperatively.

The following result is the consequence.

Proposition 1. The contracts L,D and B are convex in (r_L, r_D, r_B)

Proof. The argument will be conducted in the case of the firm. Symmetrical considerations apply in the case of the other agents.

The bank and the household must unite into a coalition to ensure equilibrium. Recall that their joint objectives are (almost) diametrically opposed to the objectives of the firm. Suppose that the worst possible payoff to the firm is a result of the two other agents employing a strategy combination that imposes the following cost $L^-(r_L, r_D, r_B) + B^-(r_L', r_D', r_B')$.

Now,

$$\pi_F = pf(I) - L^-(r_L, , r_B) - B^-(r_L ..., r_B) \forall r_D$$

Suppose that the unrestricted maximum of the profit function is given by

$$\pi_I = pf(I) - L^-(r_L', r_D', r_B') - B^-(r_L', r_D', r_B')$$

In like manner, suppose that the supply of loans and demand for bonds arising out of the unconstrained optimisation exercise conducted by the bank a nd the household above is given by $L^+(r_L'', r_D'', r_B''')$ and $B^+(r_L'', r_D''', r_B''')$.

The profit function is restricted by the level of loans and bond supply emanating from the bank and the household respectively. Profits are therefore decreasing in these levels. Simultaneously, they can be regarded as participation constraints to be fulfilled in the signing of these contracts. That is, the maximum profits above are

$$\geq pf(I) - L^+(r_L'', r_D'', r_B''') - B^+(r_L'', r_D''', r_B''')$$

Choose some

r_B which is a convex combination of r_B' and r_B'''

r_L which is a convex combination of r_L'' and r_L'

$r_D'' \leq r_D \leq r_D'''$

Then, the above equation

$$\geq pf(I) - L^+(r_L, r_D, r_B) - B^+(r_L, r_D, r_B) \equiv F(r_L, r_D, r_B)$$

$$\geq pf(I) - L^-(r_L, r_D^*, r_B^*) - B^-(r_L^*, r_D^*, r_B^*)$$

In other words, contracts will be a convex combination of (r_L', r_D', r_B') and (r_L^*, r_D^*, r_B^*).

The result can be regarded as an illustration of the view, mentioned in the previous section, that preferences in financial markets or elsewhere, are the outcomes of enduring exchanges and contracts rather than the initial datum on the basis of which they are initiated [Baron and Hannan 1994]. Preferences are endogenous because agents conform to the expectations of others. Since prescriptions about behaviour emerge from market interaction, people are assumed to have strong preferences concerning the forms of exchange rather the results. The result can also be regarded as a variant of the idea of spillovers, often associated with Keynes, between markets, resulting in maximisation exercises not being a function of variables in the market under consideration alone.

The result motivates the following putative disequilibrium dynamics on the system where the functions are increasing in y and convex in (r_L, r_D, r_B).

$$\frac{dy}{dt} = X_1(y, r_L, r_D, r_B)$$

$$\frac{dr_i}{dt} = X_i(y, r_L, r_D, r_B),\ i = L, D, B.$$

Since the first-order responses are not known, we must have recourse to the qualitative theory of differential equations. The following treatment relies on Nemytskii and Stepanov (1960). For the purpose of generality, we will describe our dynamical system above in the following manner.

We consider motions defined by the system of differential equations

$$\frac{dx_i}{dt} = X_i(x_1, x_2, ..., x_n),\ i = 1,2,...,n$$

Let a metric space R be given along with a family of mappings f(p,t) of R onto itself. The parameter t is *time*. The function f(p,t) for fixed p is called a *motion*. The set of points $\{f(p,t); -\infty < t < +\infty\}$ for fixed p is called a trajectory of this motion.

Definition 1. A point p is called 'non-wandering' if for each n of a p_n and t_n

$t_n > T_n$, $d(p_n, p) < \varepsilon_n$, $d(p, f(p_n, t_n)) < \varepsilon_n$

Definition 2. The dynamical system is *completely unstable* if all its points are wandering.

In the case of the dynamical system at hand,

Proposition 2. The dynamical system is completely unstable.

Proof. The proof rests on the fact that if the argument of a convex function is increased, the function cannot change its behaviour from an increasing to a decreasing function.

Choose two numbers p and $f(p_1, t_1)$, $p \geq f(p_1, t_1)$, such that $d(p, f(p_1, t_1)) = \varepsilon$. and points in the interval $(p, f(p_1, t_1))$ such that

$$f(p_1, t_1) < f(p_2, t_2) < ...,\ f(p_n, t_n)$$

Each of the intervals $f(p_i, t_i) - f(p_{i-1}, t_{i-1})$ is initially of the same length ε_1 say.

Now

$$p_1 < p_2 < ... < p_n ...,\ \lim_{n \to \infty} p_n = p$$

$$0 \leq t_1 < t_2 < ... t_n < ...,\ \lim_{n \to \infty} t_n = +\infty$$

Assign the sequence of positive numbers

$$\varepsilon_1 > \varepsilon_2 > ... \varepsilon_n > ..., \varepsilon_n \to 0$$

We have

$$d(p, f(p_1, t_1)) \leq d(p, f(p_n, t_n)) + d(f(p_n, t_n), f(p_{n-1}, t_{n-1})) + ... + d(f(p_2, t_2), f(p_1, t_1))$$

Repeated subdivision of the intervals and use of the triangle inequality results in the above expression

$$= o(\varepsilon_n)$$

In other words, if the point p is a nonwandering point we have

$$d(p, f(p_1, t_1)) \to 0$$

a contradiction.

We introduce the monetary authorities into the model. In particular, we consider the stabilising function of the discount rate $r_G \equiv r$. There is a close, but not one-to-one correspondence between concepts in evolutionary game theory and dynamical system theory. In the case of an evolutionary system, the state vector consists of strategies employed by agents and the concept of stability is given by the following.

Definition 3. A strategy $r^* = (r_L, r_D, r_B, r_G)$ is said to be an *Evolutionarily Stable Strategy* (ESS) if, for any other $r = (r_L, r_D, r_B, r_G)$,

$\pi_i(r^*) \geq \pi_i(r)$, i = B, H, F, G

and

Theorem [Vega-Redondo 1996] Let r* be an ESS. Then the state $x^* = r^*$ is an asymptotically stable equilibrium of the dynamical system.

In euphoric times, by a tight administration of the discount window, Central Banks make liability and asset structures more conservative by introducing uncertainty. Accommodation is only available to banks that show hard evidence that they are constraining the expansion of business loans. The destabilising influences that are the outcome of too rapid an expansion of bank financing of business and asset holdings should diminish. In terms of our formalism, the effect is to *introduce a concavity in the profit functions of the three agents.* The discount rate can be regarded as a lumpsum cost, that is not contracted for, and that is passed from the bank to the two other agents, as indicated in the diagram. *A certain dynamic stability is provided. At the same time, the system is*

not evolutionarily stable. For the latter to hold, profits must not be less than those generated by the policy in place. Indeed, the definition of an ESS does not apply with $r = r_G$ as the authorities are not a player in the game. The implicit assumption behind measures such as these seems to be that banks will operate on the asset side of their balance sheets. Banks, it has already been argued, will continue to try to achieve the desired portfolio equilibrium. They will not call in loans on a large scale. They would meet the shortage of cash by bidding for funds, by raising the rate they offer on deposits. The extent to which banks will push up rates will depend on the interest elasticity of the demand for loans from the private sector. If borrowers are prepared to pay a higher rate, it will be in the interest of banks to bid more aggressively for funds to meet their requirements. In that case, both the dynamic and evolutionary stability of the model is not assured.

Finally, in its function of buying and selling securities in the open-market, we examine the government as a 'competitive, profit-maximising bank', in the words of Goodhart (1991). As long as bank reserves are the result of open-market purchase of government securities, banks compete with the Central Bank. The strategy of the latter is r_G, the rate of interest on government paper and the interaction with the private sector is depicted in the diagram. In the absence of an infinitely elastic supply of finance from the monetary system, rising interest rates are required to induce successive portfolio adjustments. The reaction functions of members of the private sector as well as the government are therefore assumed to be increasing. In order to show evolutionarily stability, it is necessary to show that as the consequence of the entry of a leader in a hierarchical game, members of the private sector are not worse off being followers than being leaders.

The union of the firm, the bank and the household is the private sector (PS) of the economy. The strategies of this 'amalgamated' player are all possible combinations of the form $r \equiv (r_L, r_D, r_B)$. The payoffs of this 'player' are denoted by $\pi_{PS}(r_G, r)$. Consider a leader-follower model in which the government plays first. It is assumed that the reaction functions $f_i(r_i)$ are increasing functions. It is well known that if the response of the follower is unique for any action of the leader, the latter always prefers to be the leader than the follower. The following result is drawn from Varian (1992).

Proposition 3. The private sector weakly prefers to be the follower rather than the leader.

Proof. Let $(r_G^*, r^*) = (r_G^*, f_{PS}(r_G^*))$ be the Stackelberg equilibrium of the game. Now,

$$\max_r \pi_{PS}(f_G(r), r) \leq \max_r \pi_{PS}(r_G, r)$$ since profits are nonincreasing in the price of government paper. This leads to the above expression

$$\leq \max_r \pi_{PS}(r_G, f_{PS}(r_G))$$ from the definition of a reaction function, and in turn, the expression

$$\equiv \pi_{PS}(r_G^*, r^*).$$

In other words, the profits of the private sector are no smaller if it is the follower than if it is the leader.

To conclude, we have

Proposition 4. Government capitalism is evolutionarily stable.

In this case, *the dynamic stability of the model is called into question*. Feeding government liabilities into portfolios, mentioned above, as the deficit is financed during recessions means that an ability to finance investment during a subsequent recession is stockpiled. The inflationary impact of investment is augmented by the inflationary consequences of government intervention. The rise in nominal incomes, after all, is composed of an increase in output and an increase in prices. The inflationary dynamics, of such a regime, could get explosive.

III
Conclusion

The results above can be regarded as one way of addressing the 'big theorem' of a contemporary capitalist system: "a capitalist economy with sophisticated financial institutions is capable of a number of modes of behaviour and the mode that actually rules at any time depends upon institutional relations, the structure of financial linkages and the history of the economy [Minsky 1982: 92]. At one end of the range of possible institutional relations are arrangements in which Central Banks might have no role to play. All agents seek to make cash 'on the carry' on the funds they are initially endowed with. They enter into relationships that are open-ended. The interlocking nature of these implicit covenants results in contracts that have a common functional form. It is shown, once again in a vindication of Minsky, that pure capitalism is 'financially unstable'. In a first pass at possible policy regimes, the discount rate is the policy variable in the hands of the monetary authorities. To borrow the popular expression of Tobin, the effect is to "throw sand in the wheels" of the profit-maximising calculus of banks, firms and households. The effect is to induce stability into the system. At the same time, as the authorities are not players in the game and the result of the operation of the discount window is profits that are less than would have been the case without the discount rate as a cost, the regime is not evolutionarily stable. At the other end of the policy spectrum is the interventionist government which is a consolidated monetary and fiscal authority. It is a player that is the Stackelberg leader of the system. It is shown that the private sector, qua follower, is not worse off in that role than would have been the case if the government was follower. All agents benefit from the leadership of the authorities. The system is evolutionarily stable. At the same time, the competition by profit-maximising governments results in prices that are higher than would have been the case in their absence. The problem of the simultaneous existence of deficits to shore up profits and inflation remains unsolved.

Does Money Supply Process in India Follow a Mixed Portfolio – Loan Demand Model?

Deba Prasad Rath

An examination of the determinants of the money supply is an important but often overlooked aspect in Indian monetary research. The literature distinguishes three competing models of the money supply process, namely, 'pure portfolio approach', 'pure loan demand approach' and 'mixed portfolio-loan demand approach'. While the first corresponds to the money multiplier approach, the latter two are the accommodative and structuralist views of money endogenenity of the post-Keynesian monetary theory. Using RBI monthly data, this study finds the endogenous nature of money supply in India where a paradigm of mixed portfolio loan model operates. It supports the structural approach implying that the policy stance of the monetary authority and private initiatives of banks are important in money supply determination.

I
Introduction

AN examination of the determinants of the money supply is an important but often overlooked aspect of the study of the relation between money and the economy. The ways in which the central bank, the banking system and the public interact to create the monetary aggregates are significant to the conduct of monetary policy and to an understanding of the working of the macro-economy.

In the theoretical literature on the money supply process, three competing models, viz, 'pure portfolio approach', 'pure loan demand approach' and 'mixed portfolio-loan demand approach' have been distinguished. While the first corresponds to the money multiplier approach in the monetarist framework, the latter two are the accommodative and structuralist views of money endogeneity of the post-Keynesian monetary theory. In contrast to the former approach where money supply grows strictly through central bank initiative, i e, through processes strictly exogenous to financial market pressures – post-Keynesians have developed the view that pressures emerging endogenously within the financial markets are the basic determinants both of money supply growth and of credit availability. Both the endogenous money approaches share the view that banks extend credit, creating deposits in the process and look for reserves later. They are different in their view on reserves.

How and where do banks obtain the needed additional reserves once they extend credit and create deposits? One perspective argues that when banks hold insufficient reserves, central banks must necessarily accommodate their needs, as acting otherwise would threaten the viability of the financial system. No effective quantity constraint exists for the banks' reserve needs because the central bank is obligated to accommodate the demand for reserves at the discount window. This is the accommodative money supply endogeneity. Leading proponents of this view include Kaldor, Weintraub and Moore.

According to the other perspective, when central banks choose to restrict the growth of non-borrowed reserves, then additional reserves are generated within the financial structure itself through innovative liability management practices like borrowing in the federal funds and CDs. This approach of structural endogeneity of money has leading proponents in Mishkin, Earley and Rousseas. The critical difference between the 'pure loan demand approach' and 'mixed portfolio-loan demand approach' models relates to the private initiatives of banks in accommodating increases in loan demand. In the former, accommodation depends exclusively on the stance of monetary authority and its willingness to meet the reserve pressures generated by increased lending, while in the latter accommodation depends both on the stance of monetary authority and the private initiatives of banks. In terms of shape of money supply function, while the accommodative endogeneity group most closely aligned with Moore stipulates a more horizontal money supply function, the structural endogeneity group believes in a positively sloped money supply function.

In this paper, we attempt a critical review of the relevant literature to examine the theoretical and empirical issues of the money supply process, especially in the Indian context. In Section II, we give the formal analytic of the three competing approaches to the money supply process as envisaged in the money multiplier theory of the monetarists' exogenous money framework and the two post-Keynesian models, i e, the 'pure loan demand approach' and 'mixed portfolio-loan demand approach' models in the endogenous money framework. We outline the testable hypotheses for each model. In Section III, we undertake an empirical exercise to examine the Indian monetary data in the context of the recent financial liberalisation and report our results. The conclusions emanating from our analysis are reported in Section IV.

II
Analytical Framework[1] and Testable Hypotheses

Portfolio Choice Money Multiplier Model (Model A)

The pure portfolio approach corresponds to the monetarist description of the money supply process. While reserve money is the sum of currencies and reserves flowing from the central bank's balance sheet, the broad money is measured as an aggregate of different financial liabilities, viz, currencies, time deposits and demand deposits on the components side flowing from the overall banking sector, the respective quantities of which are determined by the choices of agents. In a fractional reserve banking system the supply of base money sets an upper bound on money supply. Actual money supply is then determined within this bound by portfolio preferences embodied in demands for the different liabilities.

Pure loan demand approach (Model B)

Pure loan demand approach is the post-Keynesian model where money supply is endogenously determined by the level of bank lending. Its model set-up differs from model A in that it includes demand for bank loans and the banking sector balance sheet constraint. These features in combination ensure that the market for bank lending clears and they enable loan demand to affect money supply. Deriving

from Rousseas (1985) and Moore (1988, 1989) it corresponds to the post-Keynesian accommodationist view of endogenous money wherein money supply grows strictly through the central bank initiative by way of its performance of the lender of last resort function. The central bank accommodates commercial banks' demand for reserves in their process of credit extension to economic agents. The ability of the banking system to accommodate loan demand depends on the stance of the monetary authority.

Mixed Portfolio-Loan Demand Model (Model C)

The mixed portfolio-loan demand approach is attributed to Palley (1987). It models banks' choices of composition of their assets and liabilities. It is seen that when a central bank follows a tight monetary policy, banks actively manage their assets and liabilities position in such a way as to be able to cater to profitable lending while not being reserve constrained. In order to capture these phenomena Model C includes not only demand for alternative instruments along with bank lending, but also captures the composition of their assets and liabilities through the first order condition of the pricing equation.

The analytics of the three competing money supply models, as outlined above, throws a set of testable hypotheses. According to Palley (1994), these models have different implications regarding the causes of changes in money supply. The testable hypotheses are summarised in Table 1.

Granger-causality framework, therefore, can be used to identify the relative consistency of the three models with the data at hand In the pure portfolio model (Model A), the money supply is independent of loan demand. Consequently, bank lending (L) should fail to Granger-cause both z and H. However from the banking sector balance sheet identity, changes in money supply arising from changes in either z or H, do cause changes in bank lending: consequently, both z and H should Granger-cause L. In the pure loan demand model (Model B), the money supply rises in response to bank lending. This is accomplished through passive increase in H so that the model is consistent with L Granger-causing H. However in this model lending is not reserve constrained, so that H does not Granger-cause L. In the mixed portfolio-loan demand model (Model C), there is potential for bivariate causality between both L and H, and L and z. Increased lending causes liability transformations that increases z and also increases through increased borrowed and non-borrowed reserves (BR and NBR): changes in asset preferences or changes in the supply of reserves also causes changes in lending so that z and H can Granger-cause L.

Within the endogenous money approach, a key issue is the notion of proportionality in relative movements of loans and reserves as long as the central bank fully accommodates the banks' reserve requirements consequent to their lending operations [Pollin 1991]. To test for this, we examine the ratio of L/R where L is total loans and R is the reserves. If the ratio is stationary, the stochastic properties do not vary with respect to time, then the accommodative approach can be accepted.

III
An Empirical Exercise on Indian Monetary Data

Evidence on Instability of the Broad Money Multiplier

According to Sen and Vaidya (1997), two critical assumptions form the basis of money multiplier approach: firstly, banks and non-bank public maintain stable reserves and cash to deposits ratios and secondly, the monetary base is usually treated as exogenous [Cobham 1991]. The first assumption implicitly assumes that either the portfolio of commercial banks and households are invariant to interest rates or that portfolio decisions of these two sets of economic agents have a fairly stable or predictable relationship with relative rates of returns. Either of these assumptions may be tenable in a financially repressed system since in such a system, the lack of depth in the financial markets implies that there are few assets that are close substitutes to non-interest bearing reserves and deposits.

There are two reasons why the above may not be true for a liberalising economy. Firstly, as the government opens up its capital market to foreign portfolio investment, the rush of foreign funds that accompanies such a decision (especially if the country is perceived as an emerging market) leads to significant rise in monetary base if the central bank is unable to either sterilise the inflow of funds or let the exchange rate appreciate. The first may not occur if the treasury bills market is not developed enough for the central bank to conduct open market operations (OMO).

There is a second reason why the monetary base cannot be considered to be exogenous in an economy, which has liberalised its financial sector. With market-determined prices of most financial assets, it is in the central bank's interest to adjust bank reserves so as to keep the prices of financial assets stable. The central bank lets the supply of bank reserves meet its demand to prevent fluctuation in the interest rates. Therefore even if the central bank can keep the monetary base at its predetermined level it will choose not to do so as to ensure the stability of financial markets and in its role as lender of last resort.

As bank assets and liability markets develop, banking system witnesses a structural shift from asset management to liability management [Goodhart 1984]. Liability management is a technique of bidding for wholesale deposits at negotiated rates and is an outcome of the development of wholesale money markets such as the CD market. In a system of asset management the central bank could simply increase the reserve requirement if it wishes to slow down the money supply growth. Given restrictions on other uses of funds banks would perforce have to curtail loans to the corporate sector. In a system of liability management this would no longer be the case. As Chick (1988) argues, liability management fundamentally alters the bank behaviour: instead of banks' willingness to lend being dependent on the liquid assets/reserve components of their balance sheet, banks could now decide on a target expansion of lending and fund the result by competing for the wholesale deposits and increasing recourse to the call money market for short term funds. As a consequence with liability management banks could always find the funds to meet the demand for bank loans, albeit at a higher cost of borrowing for bank customers. The control over the banks' books would depend increasingly on the interest elasticity of bank loans, something, which always is uncertain and low in the short term [Goodhart 1984]. Therefore in a regulated financial system strict control of monetary base would continually threaten massive movements in the interest rates.

Table 1: Alternative Money Supply Processes - Direction of Causality

1 Pure portfolio model	$[z, H \rightarrow L,\ \ L \nrightarrow z, H]$	Unidirectional Process
2 Pure loan demand model	$[L \rightarrow H,\ \ H \nrightarrow L]$	Unidirectional process
3 Mixed portfolio-loan demand model	$[L \rightarrow z, H,\ \ z, H \rightarrow L]$	Feedback process

Recent Financial Liberalisation Measures[2]

The implementation of a series of financial liberalisation measures in India since the late 1980s provided considerable maneuverability to banks and financial institutions in the choice of their portfolios. For the banks the CRR was progressively scaled down. Banks were afforded considerable operational freedom in the determination of their interest rates. They were also allowed to venture into newer activity areas. As a result banks are under increasing competitive pressure to seek resources from sources that go beyond their traditional areas. For example, certificate of deposits (CDs) and other money market instruments, viz, call money and repos as well as various external liabilities such as FCNR (B), NRE deposits and RIBs, etc, have provided the means for raising deposits and mobilising resources. The increase in such managed liabilities coupled with interest rate deregulation has however led to both increase and diversification of assets together with enhancement of risk and uncertainties. Banks have been funding assets, which were hitherto not significant, e g, investment in commercial papers (CPs), shares and debentures of corporate and foreign securities, etc.

In recent times significant changes have taken place in the Indian financial system. The market determined exchange rate system has been in place since March 1993. In the money market, the overnight (call) rates were freed from the ceiling of 10 per cent in May 1989 and since then the number of participants in the call money market has increased. The interest rate ceiling on rediscounting of commercial bills were also withdrawn from May 1989. Commercial papers (CPs) were introduced in 1990 and the provisions governing the issuance of CPs have been made more liberal over time. The instrument of certificate of deposits (CDs) was introduced in June 1989 and scheduled commercial banks as well as public financial institutions were allowed to set up money market mutual funds (MMMFs) in April 1992. Significant steps have been taken in the government securities market to develop treasury bills as a money market instrument. New instruments of 364-day treasury bills and 91-day treasury bills were introduced in April 1992 and January 1993 respectively. Recently 14-day treasury bills have been introduced in June 1997. Further the central government's market borrowing programme in dated securities have been put through an auction process since 1992-93. The short-term liquidity management has been undertaken by conducting repos, an instrument introduced in December 1992 and after a period of repose, reactivated since November 1996. The Reserve Bank initially conducted repos for a maturity of up to 14 days, which is the cycle for the reserve requirements. More recently, the Reserve Bank has been conducting three-day repos to absorb short-term liquidity and even out the money market rates. The Reserve Bank has also commenced daily fixed rate repos for a maturity of three days. These developments have not only given a market orientation to the government securities market but the introduction of a variety of financial instruments has facilitated better cash management of various segments of the economy.

In regard to bank lending rates, scheduled commercial banks were given freedom to fix their prime lending rates (PLRs) for credit limits over Rs 2 lakh from October 1994. The PLRs have generally responded to changes in the Bank rates since April 1997 when the Reserve Bank linked it to all its lending rates.

Unit Root Tests

We set out with testing for unit roots of the series we use in our exercise. In view of the size-power trade-off we select the order of the ADF regression through a two-step procedure. First, the length of the lag in each case was chosen using the appropriate model selection criteria of maximising the Akaike Information Criterion (AIC) and Schwarz Bayesian Criterion (SBC). Since different model selection criteria can lead to different models and, in particular when there is a conflict among the two criteria, the SBC dominates over AIC since SBC leads to a parsimonious model. At the second stage, ADF test is performed with this optimal order of augmentation. Using the above procedure, we test the order of integration of each series using ADF/Phillips-Perron test statistics, as reported in Table 2 and find that the variables are all I (1).

The monthly data on Indian money multiplier show that it varied in the range of 2.17-3.72 with a mean value of 3.0. The volatility of the multiplier measured by its standard deviation, which had declined during the 1980s from the 1970s, however, increased in the 1990s mainly due to frequent changes in the CRR. Its decadal movements are summarised in Table 3.

Keeping in view the movement in the broad money multiplier, the key question is how stable is the multiplier which could explain the long run relationship between the broad money and the monetary base. A common test for co-integration is the Engle-Granger two-step procedure. First we need to ensure that the order of integration of the dependent variable is not higher than that of the independent variables through the ADF test. In the second step, we run an OLS on the levels of the variables in question and test the hypothesis of co-integration by determining the order of integration of the residuals of this regression again through an ADF test.

Table 4: Statistical Summary of NFC/BD Ratio

Maximum	7 5681
Minimum	2 7594
Mean	4.4499
Standard deviation	99333
Skewness	54534
Kurtosis-3	- 63834
Coef of variation	22323
ADF test result of NFC/BD ratio	
With intercept but no trend.	ADF (10 lags) = -1.55 (-2.88)
With intercept but a linear trend:	ADF. (1 lag) = -2 72 (-3.43)

Note: Figures in brackets are critical values for the null of non-stationarity

Table 2: ADF Test Results with Maximum SBC Values (including an intercept and a trend)

Variable	ADF (lag)	Statistic (Critical Value)	Max SBC Value	Range of SBC Value
LM0	ADF (1)	-3.31 (-3.43)	406 2	390 6-406 2
LM1	ADF (12)	-3.17 (-3 43)	521 1	484 6-521 1
LM3	ADF (12)	-3.35 (-3 43)	658 7	641 5-658.7
Z3	ADF (2)	-2.31 (-3.43)	189.1	172 1-189.1
LNFC	PP	-3.11 (-3 43)	–	–

Note: Phillips-Perron test statistics (with constant and trend) are reported for LNFC

Table 3. Broad Money Multiplier

Period	Maximum	Minimum	Mean	Standard Deviation
1970s	3.07	2.17	2.67	0.269
1980s	3.37	2 83	3.12	0 119
1990s	3.72	2.96	3.24	0.269
1970-97	3.72	2.17	3.00	0 323

Source: WGMS, Reserve Bank of India.

The first step of the Engle-Granger two-step procedure provides a method for testing stability. If the money multiplier is stable then there must be a long-run relationship between money stock and reserve money. This relationship should be independent of the period of analysis. We test for the stability over the period April 1980 to March 1998 and the sub-period April 1980 to March 1990 since the deregulation in the Indian financial market came in the late 1980s. We expect the money multiplier to be stable in the sub-period but not over the entire period.

If the residuals from the co-integrating equations can be demonstrated to have an order of integration zero, i e, if it is an I (0) process, then the multiplier could be assumed to be stable in the long-run as co-integrating relationship would then be existing between M3 and M0. The two co-integrating regression equations for the full and the part period are (1) and (2) respectively as below:

M3 = -14854.1 + 3.42 M0 ...(1)

Adj R^2 = 0.99, ADF (1 lag) = –1.49 (–3.37)

M3 = 3563.2 + 3.04 M0 ...(2)

Adj R^2 = 0.99, ADF (1 lag) = –4.55 (–3.39)

Critical values for the null of no co-integration are reported in parentheses.

The above results show that while for the sub-period 1980-90, the period prior to financial liberalisation, broad money and reserve money were co-integrated implying stability for broad money multiplier, for the full period 1980-98 the series are not co-integrated, implying instability of the broad money multipliers. One of the reasons for such a phenomenon of instable broad money multiplier could be the impact of financial liberalisation on broad money variables since the late 1980s

Testing Palley's Hypothesis: Granger Block Non-causality in VAR Framework

We next examine the issue of causality among the different relevant variables by employing Granger non-causality tests in the trivariate VAR framework where the variations in scheduled commercial banks' non-food credit, reserve money and broad money multiplier are the variables under examination. Our literature review in the preceding section has identified these three variables as relevant. All these variables being I (1) as suggested by the ADF/PP tests, we first work on VAR in differences for our causality analysis. Then we supplement these results with a weak exogeneity test in the error correction equation in the co-integrating VAR framework. While we report our results on the former here, results on the latter are given in Appendix 3.2 at the end of this paper.

On the basis of the SBC criteria, we get the optimal order of the VAR as three assuming which we proceed on to test the null hypothesis of Granger non-causality of a particular variable/group of variable for another variable/group of variables. The log-likelihood ratio test for this test is asymptotically distributed as a chi-square (CHSQ) variate with the following hypothesis testing results:

(1) H0: Non-causality of DLM0 in DLNFC and DZ3

Reject the H0, since CHSQ (6) = 63.9 and is significant.

(2) H0: Non-causality of DLNFC in DLM0 and DZ3

Reject the H0, since CHSQ (6) = 38.8 and is significant.

(3) H0: Non-causality of DZ3 in DLM0 and DLNFC

Reject the H0, since CHSQ (6) = 51.4 and is significant.

(4) H0: Non-causality of DZ3 and DLM0 in DLNFC

Reject the H0, since CHSQ (6) = 56.8 and is significant.

Firstly, Money multiplier theory would imply both Z3 and M0 causing bank credit and not the reverse. A computed CHSQ value of 38.8 being significant for the null hypothesis of DLNFC being non-causal in DZ3 and DLM0 is rejected.

Secondly, when the DLM0 is assumed to be non-causal for DLNFC and DZ3, we again get significant CHSQ values (63.9 in (1) above), so that null of non-causality is again rejected. So DLM0 Granger causes DLNFC and also DLNFC Granger causes DLM0, the latter as seen from (2) above. This enables us to argue that the pure loan demand model does not work in India.

Since in our analysis, we have a bi-directional Granger causality from DLNFC to DZ3 and DLM0 as well as DLM0 and DZ3 to DLNFC, we may support a paradigm of mixed portfolio-loan model for India.

Pollin's Hypothesis Tested

As stated already, Pollin (1991) argues that a key feature of the accommodative endogeneity is the notion of proportionality in relative movements of loans and reserves which we test through stationarity/non-stationarity tests of the ratio L/R where L is total loans and R is the reserves. According to Pollin, if it is stationary, i e, the stochastic properties do not vary with respect to time, then one would subscribe to the accommodative approach. Given our data on the bankers' deposits with the Reserve Bank and non-food credit data pertaining to the scheduled commercial banks which constitute the majority of the banking system's total credit to the corporate sector, we tried to test Pollin's hypothesis as follows:

In Table 4 the summary profile of the loan-reserve ratio is given for the period under consideration along with its ADF statistics with intercept and no trend as well as with intercept and a linear trend. Since we find that the ADF statistic in either case for the ratio is insignificant being below the critical value, we conclude that the ratio is non-stationary and as such time variant.

In Pollin's framework, the above result would support the structural over the accommodative endogeneity approach since loans have not grown proportionally over time relative to reserves. According to Pollin, some of the reasons for the absence of proportionality among these variables could be the practice of liability management emerging in the financial liberalisation scenario implying lending growth in excess of the growth of reserves and the fact that market interest rates are not governed by central bank intervention. According to the WGMS report of RBI, however, interest rates at the shorter end of the market have generally followed the direction of the bank rate, but the effect of Bank Rate on long-term interest rates is not yet very clear.

V
Conclusions

The following conclusions emerge from the study:

Since in our analysis, we have a bi-directional Granger causality from DNFC to DZ3 and DLM0 as well as DLM0 and DZ3 to DLNFC, we may support a paradigm of mixed portfolio-loan model for India.

Within the post-Keynesian endogenous money framework, we seem to have reason to support the structural over the accommodative endogeneity approach, since the non-stationarity in the bank loan-reserve ratio and its corresponding time variance would indicate that loans have not grown proportionately over time relative to reserves. According to Pollin's scheme of things, some of the reasons for absence of proportionality could be, among others, the practice of liability management that banks do leading to a situation of growth in lending in excess of the growth of reserves

Over the full period of our analysis, in a residual based approach to testing of co-integration, we find that neither M1 nor M3 are co-integrated with reserve money. This indicates instability on the part of both narrow and broad money multipliers. However over the part period of 1980-90, we find stability in broad money multiplier. The reasons for such a phenomenon

could be the financial liberalisation witnessed in the economy since the late 1980s.

Appendix 1

Model A: The Portfolio Choice Money Multiplier Model

The equations of the model are:

$H^s = NBR + \max [0, BR (i -^{+} i_d)]$ ...(1)

$D^d = D(i^-, y^+)$ ...(2)

$C^d = C(i^+, y^+)$ ...(3)

$T^d = T(i^+, y^+)$ ...(4)

$R^d = k_1 D^d + k_2 T^d$ ...(5)

$E^d = E(i^-, i_d^{+})$ ...(6)

$H^d = R^d + C^d + E^d$ ...(7)

$H^s = H^d$ ...(8)

$M = C^d + D^d$ ...(9)

where,

H^s = Supply of base money, NBR = Non-borrowed reserves, BR = Borrowed reserves, I_d = Discount rate, D^d = Demand for demand deposits, C^d = Demand for currency, T^d = demand for time deposits, R^d = Demand for required reserves, E^d = Demand for excess reserves, H^d = Demand for base money, i = Nominal interest rate, Y = Nominal income, k_1 = Required reserve ratio for demand deposits, k_2 = Required reserve ratio for time deposits, $M_1 = M_1$ Money supply

Signs above the functional arguments represent signs of partial derivatives.

Model B: Pure Loan Demand Model

The equations of the model are:

$L^d = L(i_L,....)$ ...(10)

$iL = (1+m)\, i_F$ ...(11)

$L^s + R^d + E^d = D + T^d$ ...(12)

$T^d = tD$ ...(13)

$R^d = k_1 D + k_2 T^d$ ...(14)

$E^d = eD$ ...(15)

$C^d = cD$ ...(16)

$H^d = R^d + C^d + E^d$ ...(17)

$L^s = L^d$ ...(18)

$M = C^d + D$ ...(19)

where

L^d = Bank loan demand, i_L = Bank loan interest rate, m = Bank mark-up, L^s = Bank loan supply and i_F = Federal funds rate

Using (10) – (15) and (18) yields

$D = L[(1+m)i_F,....]/(1+t-k_1-k_2t-e)$ ...(20)

Substituting (16) and (20) into (17) yields

$H^d = (c + k_1 + k_2t + e)\, L[\, (1+m)i_F,...]/ (1 + t - k_1 - k_2t - e)$ ...(21)

While substituting (16) and (20) into (19) yields

$M = (1 + c)\, L[(1+m)i_F, ...]/ (1 + t - k_1 - k_2t - e)$ ...(22)

Model C: A Mixed Portfolio – Loan Demand Model

The equations of the model are as below:

$C^d = C(i_D^-, i_T^-, i_B^-, y^+)$ ...(23)

$D^d = D(i_D^+, i_T^-, i_B^-, y^+)$ ...(24)

Appendix 2

Firstly, from the three tests of co-integration, viz, Maximal Eigen value of the Stochastic Matrix, Trace of the Stochastic Matrix and Model Selection Criteria in terms of SBC values, we find one co-integrating vector (r = 1) among the variables. These results are reported in the Tables 1, 2 and 3. The unconstrained equation is given in Table 4.

Secondly, we restricted the co-integrating vector by successively taking the coefficients as equal to zero. The resulting CHSQ statistics in all the three cases (reported in Tables 5, 6 and 7) are above the critical value for the null of the coefficient being equal to zero, thus we reject the null of the coefficient being zero. Our results in terms of Granger block non-causality in differences are thus corroborated with this analysis in terms of the co-integrating VAR.

Thirdly, we give the error correction terms for each of the variables (Tables 8, 9 and 10). As can be seen from them, F-values being significant in all the ECM equations, none of the endogenous variables in the co-integrating VAR is weakly exogenous. We have negative signs for the two ECM terms for DLM0 and DLNFC (Tables 8 and 10). While ECM (-1) for DLNFC is negative and significant, thus being stable in its short-run movements, the other two variables are random in their short-run movements.

Modelling the Implicit T-Bill Yield

Some Preliminary Results

Abhay Pethe
Chiragra Chakrabarty

The Treasury Bills market has a position of central importance in the context of policy making in a liberalised regime, especially vis-a-vis *the financial sector. The paper begins with discussion of auction design which is not really its focus. It merely underlines the possibilities and hindrances that exist towards taking up constructive design and evaluatory exercises that would make the process efficient. An efficiently functioning market sets the tone for transmission of policy signals to decision-making agents in the economy.*

It is in this context that the paper makes an attempt to model and understand the cut-off yield for T-Bills. The process is looked at from the point of view of the RBI, the merchant banker of the government and an independent monetary authority, it is also viewed from the point of view of the players in the market who demand these T-Bills. The exercise is conducted using co-integration technique and the OLS for the 14-day T-Bills. It is also argued that for evaluatory as well as forecasting/modelling exercises to be carried out, data gaps need to be eliminated. The paper ends by underlining the tentative nature of the research reported here and suggesting fruitful lines for further research in this area.

I
Introduction

THE research presented in this paper in no way represents a completely finished and polished product. It is indeed more in the nature of a report of tentative results and an outline of a research agenda. The excuse for presenting the paper nevertheless derives from the hope that given the discerning and knowledgeable readership of *EPW*, we may be able to get some useful inputs which would help in furthering and refining our efforts. The paper comprises of six sections in all, including the present one. In the next section we underline the importance and the changed nature of the fiscal-monetary co-ordination problem, especially from the perspective of the focal point of our interest. In the third section we deal with the T-Bills market in India and comment on the related issues of auction design and data availability. In the fourth section we present our model and results pertaining to the 14-day T-Bills. In the fifth and penultimate section we, very briefly, sketch an agenda for further (related) research. In the final section we conclude.

II
Fiscal–Monetary Co-ordination Problem

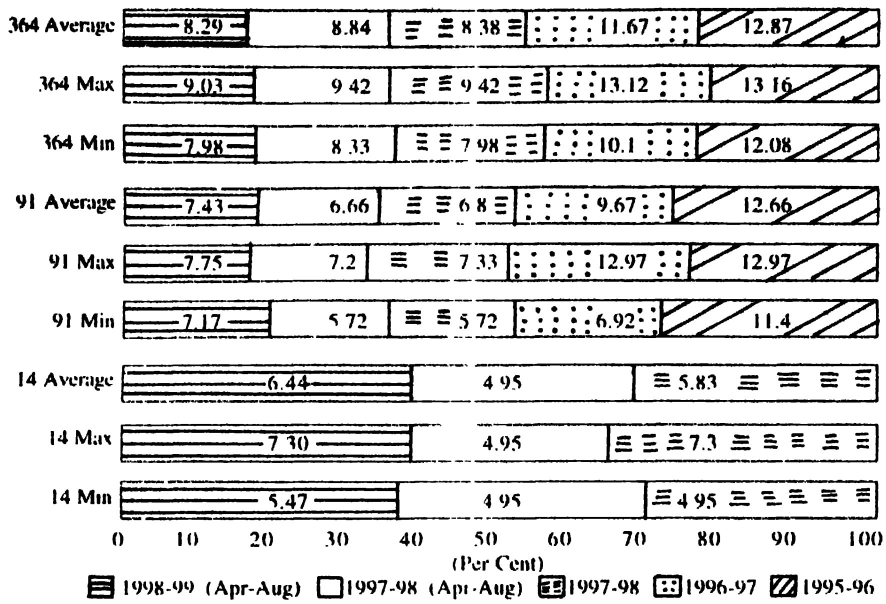
The Indian economic crisis of the early 1990s is a part of the folklore of contemporary economic history and need not detain us here. One of the off-shoots of that episode was the paradigmatic change in the policy domain related to the macro-management of the economy. Again, whether the initiating impulse came from indigenous wisdom or was the result of the duress exercised by international organisations is hardly relevant for us. The fact remains that there were momentous and substantive steps taken in the domain of policy making, not in the least prompted by the change in the macro-economic environment. The macro framework was sought to be liberalised and opened up which implied that the economy that for so long was *directed*, had now to be *co-ordinated*. Various institutional changes had to be brought about and indeed all the institutions (old and new) had to adapt and traverse the difficult and steep learning curve – a process that is still underway.

India is of course not the only country undergoing these changes. Indeed, it is clear that, in a sense, the entire world economy is in transition. Apart from the individual countries facing the crises, international institutions have been at the forefront of searching and recommending solutions. There has now emerged a set of guidelines comprising steps to be taken to remedy the situation. This has broadly been termed as 'Washington Consensus'. Naturally this package has been put together in a remote fashion and is general enough to attract criticism from many quarters. Whilst it may be discounted and ignored when the criticism is obviously based on purely ideological grounds or on partisan politics, it is a different matter when such criticism emanates from serious academics. It is to be noted that whilst there is no great quarrel about the broad and general strokes, the specific details about 'how much' and 'how far' the programme needs to be pushed is quite another matter. This is perhaps natural and we leave it there as of being of no particular relevance to the focus of our paper.

One of the components of the stabilisation-structural adjustment programme on which there is a consensus is the common understanding in the economic management that large and sustained fiscal deficits result in excessive domestic and external borrowings or monetary expansion, with concomitant problems for the domestic financial sector. This may take different forms such as inflation, low growth, chronic overvaluation of local currency, loss of competitiveness leading to current account deficits [Rao and Nallari 1996]. We may note here that whilst at the macro level this is acceptable, the precise content of *where* to cut government expenditure and *to what extent* is indeed is a bone of contention. This is where the controversy regarding different kinds (extent and targeting) of subsidies as well as the fact of government cutting down on its capital expenditure in its budget comes in.

In the earlier times the problem of fiscal-monetary co-ordination was just that of proper enunciation of goals by the government and then establishing proper communication between its finance ministry and the RBI. This was because of the existence of the ad hocs/on tap T-Bills. The havoc that it brought about and the problems it caused are well known. Thanks to the new paradigm of macro-management in general and specifically the agreement signed between the ministry of finance and the RBI, the ad hocs have been phased out. This has meant some autonomy to the RBI which may now act upon its independently perceived monetary stance.

Graph 1: Yield Structure of Treasury Bills for Last Three Years



Of course being autonomous *de jure* is still different from acting autonomous *de facto*. The latter requires a new kind of mind-set that will act as an autonomous agent (although acting within the broad norms of national agenda but not as another department of the government of the day). This has led to the other area of consensus which is the realisation that with withdrawal of the 'administered regime' and coming into play of incentive based initiatives, getting the prices right becomes vitally important. One such price of particular importance, especially from the perspective of this paper, is the term structure of interest rates. Interest rates are important for allocational and investment decisions for they provide the opportunity cost structure in the economy. In a developed and integrated financial structure, one of the chief roles of the Central Bank is to provide *a reference rate which signals the prevailing status as well as the intentions of policy-makers*. Even in India the RBI has changed its focus from monetary targeting to interest rate targeting and so have some of the academics. The reference rate of course cannot be announced, but must emerge with market consensus, as must the term structure. Some of our preliminary results suggest that there is no co-integration between the different T-Bill rates [Chakrabarty 1998]. Given that sovereign risk is no risk the cross-sectional time preference ought to be stable and hence there should be a stable relation. Thus, it would appear that different T-Bills perform different macro-management functions, rather than just reflecting time preference structure. It is in this overall context that understanding and being able to predict the cut-off yield as well as the development of thick, well-regulated and hence efficient secondary debt market in Treasury Bills assumes importance. Let us now turn to a brief discussion of the T-Bills market in India.

III
The T-Bills Market

During the 1980s and 1990s, significant reforms to develop government securities markets have been undertaken in many countries, including developing as well as industrialised countries and economies in transition. In many of these countries, the authorities have played an active role in fostering the development of institutional structure of the market, active on the self-evident premise that an appropriate structure is needed for the efficient functioning of the markets. A central proposition of this literature is that the pricing of asset cannot be determined independently o the institutional structure of the marke (particularly the organisation an mechanics of trading). If the structure o government securities markets affect prices (interest rates), by extension it affect the cost of national debt. In the contex of the new role that the RBI has bee called upon to play, it becomes importan that it designs the auctions for selling th T-Bills in an optimal fashion. Also i becomes mandatory that certain kinds o data be made available to the public a large and researchers in particular so tha evaluatory exercises be undertaken. To get an idea of the growth in the T-Bill of different tenures see Table 1 and th corresponding yield structure is shown in Graph 1 and Graph 1A. Let us now briefl look at these issues especially in the India context and suggest some changes tha would enhance their utility.

Auction Design

Auctions are increasingly bein researched especially in the context o widespread growth of government deb and yet there are no ready-made answer here. Auctions are stylised markets wit well-defined rules used to extrac information and modelled in the contex of game theory. A basic taxonomy o auctions was proposed some time ago b Vickrey (1961) and represents the begin ning point of all subsequent research However, despite Vickrey's seminal con tribution in establishing the revenu equivalence for different auction format in early 1960s, most subsequent advance have been made with respect to format that bear very little resemblance to actua auctions of government securities.

There are various ways in which auction may be classified. In the context of divisibl multiple units scheme (which comes clos

to T-Bills auctions that we are interested in here) the auctions may be distinguished on the basis of whether the individual has to pay the price bid by her if successful or must pay the minimum price that would exhaust the issue. In the earlier case it is termed as 'multi-priced' and in the latter 'uniform-priced' auctions. Also the auctions may be distinguished on the basis of whether the bids are submitted in the 'sealed form' or in public (open outcry) form. Auctions may be classified on the basis of whether the bidders attach 'private' value or 'common value' to the commodity being auctioned. For more details about auctions and price settings, as well as details of conduct of auctions in India, see Chakrabarty (1998).

Most T-Bill auctions fall into the category of multi-price sealed bid auctions also known as the first price auctions when referring to single unit and as discriminatory when multiple units are involved. There are arguments both in favour and against the relative superiority of multi-price versus the uniform price formats from the revenue collection angle. In the standard private value model, the auctioneer's effort to extract the surplus below the demand curve is exactly offset by the shift in the demand curve itself. Subsequent research has tried to extend the equivalence result to less restrictive conditions. Holt (1980) and Harris and Raviv (1981) for example have extended the analysis to the case of risk aversion. When bidders are risk averse, they place premium on auction formats that present them with less uncertainty. A line of research more relevant to T-Bills is the common value approach. Following earlier studies, Milgrom and Weber (1982) showed that revenue potential of each of the formats could be ranked on the basis of each format's ability to mitigate the winner's curse. However these are restrictive results and do not necessarily extend to the T-Bill auctions.

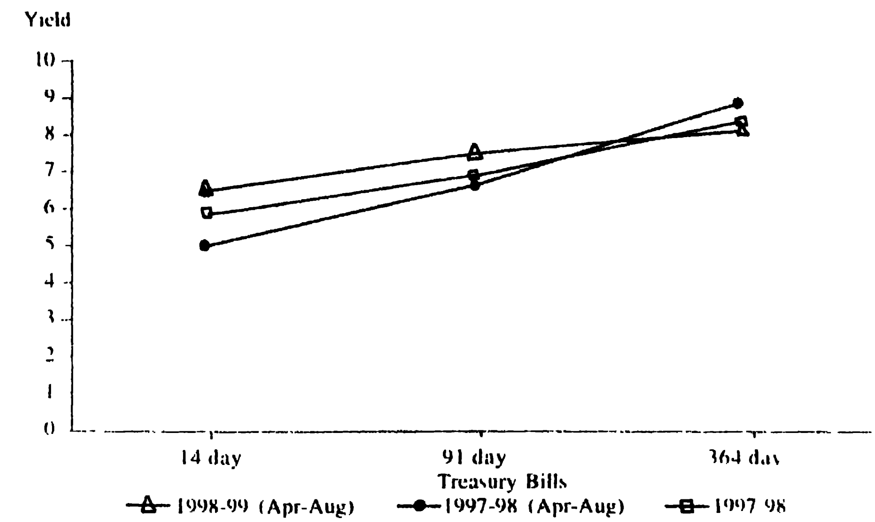
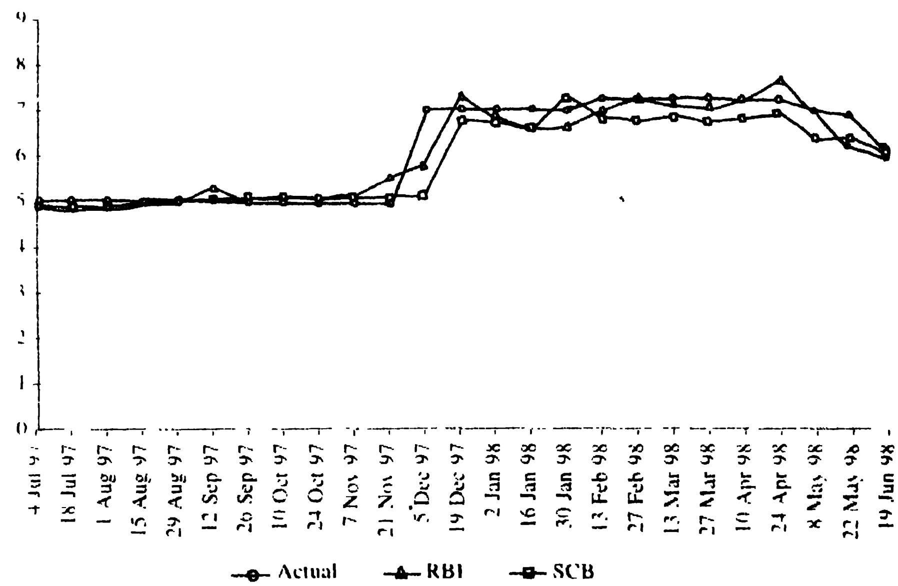
CBA = Competitive Bid Accepted
NCBA = Non-Competitive Bid Accepted
DEVPR = Devolvment on Primary Dealers
NA = Notified Amount
TI = Total Issue
WAP = Weighted Average Price
WAY = Weighted Average Yield
AMTOUT = Amount Outstanding
SECMIN = Minimum Secondary Market Price
SECMAX = Maximum Secondary Market Price
RBI = 14 day T-bill outstanding amount with RBI
Bank = 14 day T-bill outstanding amount with commercial bank
State = 14 day T-bill outstanding amount with state government
Others = 14 day T-bill outstanding amount with others

In this case each bidder presents an entire demand schedule rather than a single price and this dramatically widens the strategic possibilities and the set of equilibria. Another interesting area has to do with the number of bidders. Whilst greater the number (thickness that is brought up whilst discussing the Indian situation) the greater will be the competition, it also reinforces the winner's curse. Thus there has to be an optimal number of bidders and more need not necessarily be better. However *the broad consensus continues to be that wide participation should increase auction revenue*. Another prediction that most theoretical models tend to agree on is that more information the bidders have the less will be their profits and more will be the auctioneer's revenue. The intuition is rooted in the winner's curse and accordingly it will be in the auctioneer's interest to reveal more information. As the general results on the revenue potential of various auction formats are not available, studies have been geared towards studying special factors that may tilt the balance towards one format rather than the other, especially *vis-a-vis* multi-price and uniform price formats. In India too the RBI has switched to the uniform pricing format. Since cornering and collusive behaviour is particularly of interest to the policy-makers, the presumed argument could be that uniform price auctions would foster lower cost of bid preparation, greater bidders' participation and fewer incentives for bidders to pool and place their bids through brokers to collude and corner the market. However, the jury is still out on this and Back and Zender (1992) have argued precisely the opposite that uniform price auctions may provide greater incentive to collude. From the allocational point of view however, Maskin (1992) has shown that from common value stance, and if the informational asymmetry is not too large, uniform price format emerges as a dominant format. These are interesting puzzles especially for India which is just starting out in her T-Bill auction venture. For conducting research much more openness in terms of data is a prerequisite. It is to the status of data availability that we now turn.

GRAPH 1A: YIELD CURVE FOR LAST TWO YEARS



GRAPH 2 FORECASTED VALUES OF 14 DAY T-BILL FROM RBI AND SCHEDULED COMMERCIAL BANK MODEL AND ACTUAL VALUES



DATA AVAILABILITY

Treasury notes and bonds of various maturities are issued periodically through discriminatory price auctions (very recently the RBI has taken the decision to switch to uniform price auctions in case of T-Bills). The treasury announces the quantities of notes and bonds of different maturities that would be sold in upcoming auctions and accepts competitive and non-competitive bids on the auction date. The competitive bidders, viz, the designated primary dealers and scheduled commercial banks submit bids for price quantity pairs. The non-competitive bidders submit tenders for quantities that they are willing to buy at the quantity-weighted price of the accepted competitive bids. Others are required to deposit 2 per cent of the amount bid along with tenders. This transaction cost (since these deposits may be held for two weeks and earn no interest) obviously creates incentives in favour of others bidding through the primary dealers. In addition, the RBI also places a non-competitive bid for quantity announced prior to the auction. The RBI then collects the bids, nets out the non-competitive bids and allocates the balance to the highest bidders among the competitive bidders. The winning bidders make the payments for their allocations on the issues date, which is typically a week from the auctions date.

The transparency in the internal debt segment in the Indian economy in general and in T-Bills market in particular has improved of late. Two major sources of information on internal debt are RBI Annual Report and the Report on Currency and Finance. For details of the kind of data available from the two sources see Pethe and Chakrabarty (1998). The RBI Annual Report gives data on 91- and 364-day T-Bills auctions data for the last five years. The Report on Currency and Finance covers the auctions of 14-day T-Bills in detail.

It covers (a) date of auction, (b) date of issue, (c) number of bids received, (d) face value of amount received with the break up for (i) competitive, (ii) non-competitive, and (iii) total, (e) number of bids accepted, (f) face value of amount accepted with break up, (i) competitive, (ii) non-competitive, and (iii) total, (g) devolvement on primary dealers, (h) minimum offer price (cut-off), (i) implicit yield for minimum offer price, (j) cummulative face value and (k) amount of outstanding bills as on issue price. Thus this is a rather comprehensive coverage of 14-day T-Bill auction although the distributional details of bids are still not available. As compared to this the data on 91-day T-Bill auctions are still not reported in detail, e g, the break up of competitive and non-competitive break up is not available. Thus things like estimation of bond tail distribution or a comprehensive modelling for 91-day T-Bills and looking into some other interesting issues – which we have already noted in the previous section – is still not possible for the general research scholars. Let us now turn to reporting the empirical findings regarding our model for the 14-day T-Bills.

IV
Our Model

In this section we report some of the preliminary results regarding the various variables used for modelling 91- and 364-day T-Bills and the estimation thereof. Next we look at the 14-day T-Bills, discuss the variables of interest from the RBI's as well as the Scheduled Commercial Banks' point of view and present the estimation results. Finally, we put together the two estimates with respect to the 14-day T-Bills and check for co-integration with the actual yields. The data used for our study are presented in Tables 2 and 3.

Preliminary Results for 91 and 364 Day T-Bills

In this section we report some of the preliminary findings with regard to the preliminary data mining and identification of relevant variables for estimating the yield of 91- and 364-day T-Bills. Since the focus of the paper is on 14-day T-Bills the treatment here is perforce of a cursory nature.

In estimating the implicit yield of the 91-day T-Bills, we have kept in mind the Report of the Committee to Review the Working of the Monetary System according to which, the T-Bills should be developed as active monetary instruments and constitute an ideal short-term paper in the money market. What comes in the way of such a development is the fact that the yield is not market related. It is believed that the 91-day T-Bill discount rate should be marginally positive in real terms. This means that the nominal rate of discount should be higher than the expected change in the price level. The real yield on the T-Bills should meet the expectations of the capital market. We have not directly modelled these expectations but have proxied them by taking the weighted average of secondary market yields of Treasury Bills. The procedure for this may be understood by looking at Table 4. Apart from economic common sense based on received wisdom in the profession, we have identified other variables by constructing a large correlation matrix. Using the trusted OLS technique, we tried out different equations using variables like one fortnightly lag of M3 and growth of WPI (LM3 and LWPI respectively) to catch the monetary policy stance, one and two lag implicit yield at cut-off price of 91-day

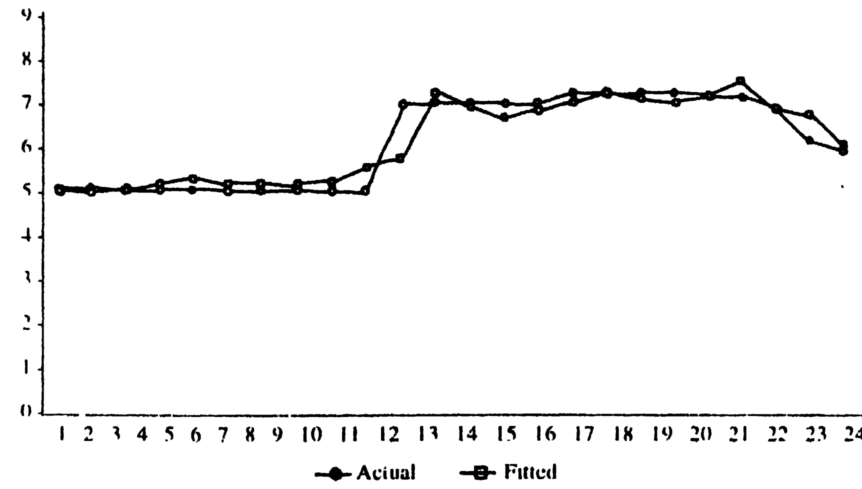
AMTF Amount traded of 14-day T-Bill in the secondary market
MINF Minimum yield of 14-day T-Bill
MAXF Maximum yield of 14-day T-Bill
AVERAGEF Average of Min and max of 14-day T-Bill in the secondary market
AMTN Amount traded of 91-day T-Bill in the secondary market
MINN Minimum yield of 91-day T Bill
MAXN Maximum yield of 91-day T-Bill
AVERGEN Average of Min and max of 91-day T-Bill in the secondary market
AMTT Amount traded of 364-day T-Bill in the secondary market
MINT Minimum yield of 364-day T-Bill
MAXT Maximum yield of 364-day T-Bill
AVERGET Average of Min and max of 364-day T-Bill in the secondary market
WAVERAGE: Weighted average of all three instruments

T-Bills (LNTB and LLNTB respectively), this is meant to catch the own price reflecting local static expectations, two lag implicit cut-off yield of 364-day T-Bill (LLTBILL) to catch the expectational mood in the longer term market, and one and two lags in the secondary market yields (LAVERGEN, LLAVERGEN respectively) to catch the linkage and learning from the secondary markets to primary market. As already noted, the correlation matrix as well as the data availability were the constraining factors in putting together of the story based on regression results. Looking at the t-values and the signs *vis-a-vis a priori* expectations, we chose the equation which had LWPI, LNTB, LLTBILL and LAVERGEN.

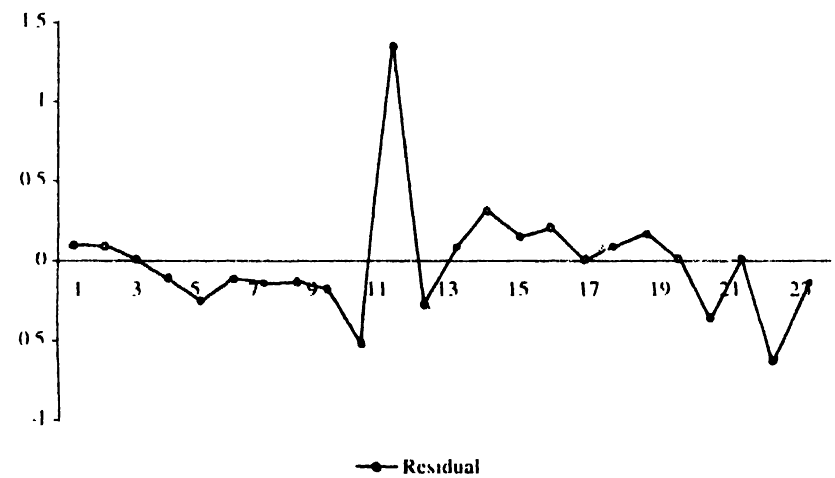
By following a similar procedure we could identify the following variables as being relevant to modelling the 364-day T-Bill yield: LM3 (the measure of money stock), LNTB (the lag of 91-day T-Bill yield, proxy for the term structure for sovereign paper) LTBILL (the lag of 364-day T-Bill yield, reflecting the inertial learning effect via static expectations) and LAVERGEN (the average secondary market price of all the T-Bills, reflecting the linkage and integration between the secondary and primary markets).

The results, to repeat, are of a tentative nature and the model has been constructed from the point of view of the supplier (RBI). The tentative conclusion that we may draw are that whilst the 364-day T-Bill is somewhat (though not as much as in the case of 14-day T-Bill, as we shall see below) related to the money market, the 91-day T-Bill yield is not. It is rather related to the WPI leading one to believe that the monetary authorities use this instrument for control and monitoring of inflation and 364-day T-Bill (as well as 14-day T-Bill) for monitoring and liquidity management in the economy. Let us now turn to the model for 14-day T-Bill.

GRAPH 3A: FORECASTED VALUES OF 14 DAY T-BILL FROM THE COMBINED MODEL OF RBI AND SCHEDULED COMMERCIAL BANK MODEL AND ACTUAL



GRAPH 3B. GRAPHICAL REPRESENTATION OF RESIDUALS



MODEL FOR 14-DAY T-BILLS

The estimation of the model for 14-day T-Bill implicit yield is based on 50 data points. These represent all the auctions that took place in the last year. As already noted, since the data availability in this case is better than in other cases, we have been able to consider some other relevant variables. Also we have been able to model the process from two angles, viz, from the RBI's view point and from the point of view of the players in the market who demand these T-Bills, mainly the scheduled commercial banks. We present the results from RBI's point of view then we move on to the scheduled commercial banks and finally we put the two together to get a composite forecast or estimate.

RBI'S POINT OF VIEW

One of the paramount goals of the monetary authority (in our case the RBI) is to promote a policy of efficient price discovery (or the interest rate determination) which forms a crucial element in the transmission mechanism of monetary policy. Also, RBI as an agent of the central government is responsible for raising the resources (debt) for the government, which it must do at the cheapest possible cost so that the future servicing is least burdensome. In addition, the RBI typically intervenes through the government securities market and its organisation to attain its operating goals. Thus thick and efficiently operating primary and secondary markets are crucial to the efficacy of its policy initiatives.

Again, as in the earlier cases, various variables were tried and finally on the basis of correlation and regression results we modelled the 14-day T-Bill implicit yield at cut-off price to be a function of one lag fortnightly growth in broad money supply (LM3), one lag of 14-day and 91-day T-Bill implicit yield at cut-off (LFTB and LNTB respectively), and weighted average of secondary market yield of all types of T-Bills (LAVERGEN). Co-integration exercise was conducted to identify a co-integrating vector using Johansen Estimation method with the help of Microfit 486. Co-integration helps us to identify long run relationships which given the short time series available in the context of the present exercise have to be interpreted to mean stable relationship. The details of the co-integration as well as the OLS regression from the RBI's point of view are reported in Tables 5A and 5B. The OLS regression equation is as under:

$$FTB = 4.352 + 0.471\ LM3 + 1.089\ LFTB + 0.747\ LNTB + 0.0217\ LAVERGEN$$

As may be seen from the statistical details of the regression equation, the fit is quite good and so are the t-values of all the variables (reflecting the significance) excepting the last variable. This is perhaps due to the fact that 14-day T-Bills are a recently introduced instrument and hence the integration with the other segments of the market is not very great. Rest of the diagnostic statistics too are reasonably good. Let us now look at the scheduled commercial banks' view point.

Scheduled Commercial Banks' Point of View

The players in the government securities market may be divided into two kinds. One, the patient traders, those who are willing to wait. The small retail or household investors or financial investors like LIC, GIC whose trading is motivated by considerations of long-term employment of funds or liquidity are representative of this type of traders. Two, there are the impatient traders, those willing to pay higher intermediation cost in return for immediate trade execution. Institutional traders are of this type, having shorter investment horizons and with trading strategies that are time and information sensitive – for example, dynamic hedging, market arbitrage or spread trading strategies. We will however not make such distinction and only look at the scheduled commercial banks' behaviour as being representative. Given the development of the market in India, they represent a dominant portion of the agent players. Thus at this stage of our research we would be well advised to keep matters simple.

We began the exercise by conducting simple statistical computations such as the mean, standard deviation, correlation for the various relevant variables. For the estimation, we considered variables like competitive bids (CBA), non-competitive bids (NCBA), devolvement on primary dealers and the RBI (DEVPR), notified amount (NA), total issue (TI), weighted average price (WAP), implicit yield at cut-off price (IYACP), cut-off price at auction (CP), amount outstanding one day before the auction (AMTOUT), secondary market minimum and maximum yield for 14-day T-Bills before the auction (SECMIN and SECMAX respectively), RBI's and commercial banks' outstanding amounts of 14-day T-Bills before the auction (RBI and BANK respectively) state's and others outstanding amounts of 14-day T-Bills before the auction (STATE and OTHERS respectively). We concentrated on the variables having reasonable correlation with the IYACP. For example we found that the call money rate and IYACP have positive correlation (0.038). Thus whilst call money rate is completely market determined the 14 day yield is related but a smoother and measured response. The correlation between CBA and IYACP is negative as expected. Thus when there is excess liquidity in the economy the higher demand (reflected in higher competitive bids) pushes the prices up and hence the yield down. The correlation between IYACP and banks' outstanding amount is negative (-0.52). This can support the rationalisation that lower the secondary market price the higher the IYACP, in any case the secondary market price acts as the cap on the primary price, of course given the institutional norms and rigidities. There are many such interesting correlation results around which may be rationalised to be supportive of plausible stories or hypotheses. However, since we have not done anything more rigorous like causality testing these would be largely speculative and hence we leave it at that [Chakrabarty 1998].

There are some noteworthy features of the 14-day T-Bill data. For instance, there is hardly any difference between the cut-off price and the weighted average price. This is particularly noteworthy because in India we have a multi-price system (at least we had it at the time for which we have the data), hence a difference is to be expected. The only time we may expect no difference at all is when the debt market is so developed that the information sets of the players gets updated instantaneously and there is efficient cross flows of information leading to exactly the same bidding strategies (and bids). The other situation could be when the number of players is small and hence collusive activity takes place. Here a group of brokers may form a

ring and bid at less than competitive price sharing the surplus profits thus reaped. This puzzle needs further investigation.

Turning to co-integration, several combinations of variables were tried out and based on diagnostic results the following was found to be the best:

IYACP = ϕ (AMTOUT, CBA, BANK, SECMAX)

The co-integration was done using Johansen's estimation technique without trend, using the Microfit 486. The details of the co-integration output are reported in Table 6B. Using the co-integration LR test using trace of stochastic matrix we obtained three co-integrating vectors. There are no consensual selection criterion available in the literature, so that economic intuition is used to select one of these. In any case we do not perform any error correction computations in this paper so that the adjustment vectors are of no direct relevance to us. Assured of the long run (stable) relation between the variables involved we went on to use the OLS technique to perform regression analysis the details of which are reported in Table 6A. The OLS equation is:

IYACP=4.45 – 0.158E-3 AMTOUT – 0.934E-4CBA+0.726E-4BANK + 0.288 SECMAX

Selecting the third co-integrating vector and the above OLS equation leads to signs which are a priori expected. Thus the bidding strategy for the scheduled commercial banks may be constructed by considering the following variables:

1 Amount outstanding of 14 day T-Bills in secondary market
2 Amount outstanding of 14-day T-Bills with commercial banks
3 Competitive bids accepted
4 Secondary market yield.

Putting It Together

Having obtained the prediction from the RBI as well as the scheduled commercial banks' point of views, we now put the two together. We take the two predicted series and the corresponding actual series and try out a co-integration exercise. Having tried out the co-integration, we go on to using the simple OLS estimation technique, which we now report. As in the earlier case, the statistical details *vis-a-vis* the equation given below as well as the co-integrating vectors are reported in Tables 7A and 7B. The regression equation is given by:

ACTUALL= - 0.117+0.792 RBI+0.237 SCB

where, ACTUALL represents the actual value of the T-Bill yield at cut-off price, RBI represents the forecast values from the RBI's angle and SCB represents the forecasts from the point of view scheduled commercial banks. The fit is very good and there is evidence of co-integration. The t-value associated with the estimated coefficients is significant. One may venture to say that in the tussle for the determination of T-Bill yield the predominant role continues to be of RBI. The predictability may be seen from Graph 3A and Graph 3B depicts the residuals of the above regression. We have used co-integration only from the point of view of diagnostics and have not used them for error correction, et al. But in case of 'putting it together', it might be worthwhile noting that the long run matrix shows a greater coefficient for SCB. This could be interpreted by saying that whilst just as yet the 14-day T-Bill market is in its infancy and so the role and dominance of RBI is pronounced. Already however the trend shows that with passage of time and development of the market, the SCBs (or the other agent players) will have a greater say (with coefficients being interpreted to stand for the relative bargaining strengths) in the bargaining game.

V
Agenda for Further Research

There are several specific issues that have been mentioned in the body of the paper (especially in the section on Auction Design) that need to be researched upon. With data availability this should become possible. Also, and perhaps ultimately, the specific problem of implicit T-Bill yield needs to link up at both the ends and put in a larger perspective. For example, after being able to predict/forecast the yield, it needs to be linked to other rates in the macro-economy and its causation (direction as well as magnitude) needs to be studied so as to infer certain policy lessons At the other end the government expenditure function needs to be modelled and that part of it which is financed with the help of T-Bills needs to be endogenised The finance ministry and RBI are engaged in a game – each with its own special agenda given their individual status – but at the same time involved in attaining collinear goals. The interesting question here would be whether to model this process as a sequential game or a simultaneous move game and which is more reflective of the bargaining strengths of the individual agent players. In a cascade sense, it will be interesting to model the downstream game between RBI and 'others' in the context of the T-Bill market. All this apart from official openness, economic wisdom and insights into Indian reality – will require competence in game theory, computational capability, data availability and operational capability in the area of macro/policy modelling. Here we have merely sketched a speculative agenda, but we believe a useful one and perhaps to be pursued, not by individual researchers but rather by group of researchers supported by institutions.

VI
Conclusion

As noted at the beginning of this paper, here we have tried to present a few tentative steps that we have taken towards understanding/modelling/predicting the implicit yield of T-Bills. The yield is a very important rate, for in the changed environment of macro-management, it must successfully serve as reference rate defining the opportunity cost structure in the economy, as well as serving as a signalling device for the RBI to set out its monetary stance. Its not just the prediction of yield that is important but also the entire design of efficient institutional framework as well as its mechanism is crucial. We are obviously not yet there, but we are getting there. Already there are interesting aspects to be seen, one of which we may mention as an aside. A glance at the Graph 1A reveals that *there is a clear evidence of flattening of the yield curve with a major weight being contributed at the shorter end.* This signifies underlying inflationary trend that is clearly seen in the fact of rising inflation in the economy. These and such other diagnostic signals are there to be perceived and made use of. Also, there are several puzzles that exist in this area, some of which we have hinted at. We have also tried to argue in favour of greater data dissemination and transparency, which is in any case in the interest of the auctioneer. This is an extremely crucial, fertile and useful area of research and it is to be hoped that individuals and institutions will apply themselves to the task.

[This paper is based on the presentation at a recent workshop on 'Future Directions for the Indian Economy: Macroeconomic Issues with Special Reference to Capital and Finance, held at Gokhale Institute of Politics and Economics, Pune]

Capital Adequacy Ratios

An Agnostic Viewpoint

D M Nachane

The main purpose of bank regulation is the maintenance of a sound banking system, which is usually narrowly interpreted to mean 'prevention of bank failure'. To this end, regulators examine the riskiness of assets and the adequacy of capital. But do rigid capital adequacy ratios ensure adequate bank capitalisation in reality? Alternatives such as Value-at-Risk and Pre-Commitment models have been used in some developed countries. India needs theoretical analysis of these models and empirical data before it can consider a shift from the current capital regulatory arrangements.

I
Introduction

A BANK may be regarded as an archetypal depository financial institution, the greater part of whose liabilities comprise claims issued against itself, i e, deposits. The functional role of capital in a depository financial institution is fundamentally different from that in an industrial firm. The equity capital of any firm is only partly a guarantee of the value of the firm's fixed obligations, its major function being the provision of assets to the firm. However, for a depository financial institution, the importance of equity capital derives principally from its insurance function. Reflecting this underlying difference in the relative role of capital, a depository financial institution has historically attracted at least three types of regulations. Firstly, although such institutions may issue a variety of deposit liabilities and hold a variety of assets, legal and institutional prohibitions restrict the class of securities that may be used for each purpose [Pyle 1971]. Secondly, the institutions are not allowed to sell any of their assets short and thirdly, some kind of reserve or liquidity requirements are usually in place, tying specific forms of asset holdings to specific forms of liabilities. In few other industries is the capital investment decision so subject to government intervention and control.

It is generally agreed that the main purpose of bank regulation is the maintenance of a sound banking system usually interpreted narrowly to mean 'the prevention of bank failure' [Leonard 1941 and Davis 1966]. In carrying out this legislative intent, regulators usually look to the 'riskiness' of a bank's assets on the one hand and to the 'adequacy' of its capital on the other. Given the numerous difficulties in assessing riskiness of different assets, regulators have shown a preference for laying stress on capital adequacy [Peltzman 1970]. The introduction of deposit insurance complicates the regulator's task. Insured deposits will not require the bank capital cover against losses, and thus the size of the bank's capital is irrelevant in their case. Thus, the institution of a deposit insurance system may encourage banks to limit their capital, which in turn increases the possibility of the deposit insurance actually having to be used. As Jacobs (1964) indicates, the fact that deposit insurance fees do not vary with a bank's capital structure enables highly leveraged banks to avoid paying more for deposits. The difference between the bank's private cost of a highly leveraged capital structure and the social cost is paid by the deposit insurance agency in the form of a greater risk exposure.

Historical experience with capital regulation shows a great deal of variability. In the US, capital regulations in banking, date back at least to the National Bank Act of 1863. American banking legislation (pre-1981) specifically instructed federal regulatory agencies to certify the capital adequacy of institutions subject to their jurisdictions in matters relating to the grant of new charters and membership of the Federal Reserve System. The threat of expulsion (from Federal Reserve System) was omnipresent though rarely executed. (The one notable incident of expulsion is, of course, the Continental Bank and Trust in the 1960s.) The situation in UK was even more lax, at least up to the 1980s. Thus we find the high priest of British banking, Sayers, remarking in 1967 that "Nowadays in England at least, capital has ceased to be necessary, especially as the banks are, by special dispensation under the Companies Acts, allowed to conceal their profit experience...In some other countries, where the banks are less firmly established and public confidence could be more easily shaken, the capital of banks naturally retains its original significance."

In the pre-nationalisation phase of Indian banking, capital standards attracted a modicum of attention from the Reserve Bank of India (RBI). The declining ratio of capital (paid-up capital plus reserves) to total deposits from 9 per cent in 1950 to 4 per cent in 1960 for Indian banks, had prompted the RBI to advise banks to aim at a ratio of 6 per cent, through compulsory transfers of 20 per cent of declared profits to reserves [Jagirdar 1997]. Nationalisation however ushered in a sense of complacency on the issue of capitalisation and the capital to deposit ratio for public sector banks seems to have fallen to fairly low levels (less than 2 per cent) in the early 1980s.

In 1981, in the aftermath of the US thrift industry crisis, a new three-tier set of explicit capital requirements was introduced in that country. Contemporaneously regulators in other countries were echoing similar concerns about their respective financial institutions. The G-10 countries endorsed the so-called Basle Accord in 1988, incorporating the recommendations of the Basle Committee on Banking Supervision under the chairmanship of W P Cooke [Bardos 1988]. The three major principles of the Basle Accord were the following:

(1) A bank must hold equity capital to at least a fixed per cent (8 per cent) of its risk-weighted credit exposures as well as capital to cover market risks in the bank's trading account.

(2) When capital falls below this minimum requirement, shareholders may be permitted to retain control, provided that they recapitalise the bank to meet the minimum capital ratio.

(3) If the shareholders fail to do so, the bank's regulatory agency is empowered to sell or liquidate the bank.

The Basle Committee on Banking Supervision (1996) lent a substantial new dimension to the 1988 Basle Accord by incorporating market risk in the determination of capital adequacy. The assessment of market risk could be based on a

bank's own internal model, subject to some general restrictions on parameters and structure [Hendricks and Hirtle 1997].

Turning to the situation in India, the Committee on financial sector reforms (1991) (usually referred to as the first Narasimham Committee) had recommended the adoption of the Basle norms, with a three-year adjustment period. In accepting the Committee's recommendations, the RBI directed banks with international presence to achieve the norms by March 1995, while other banks were obligated to reach the norm in two stages by March 1996. Eight banks failed to meet the targeted deadline, though by March 1997 only two defaulters persisted. The second Narasimham Committee (1998) took the process of bank capitalisation several steps ahead. Firstly, it was sympathetic to the incorporation of market risk as suggested by the Basle Amendment. Secondly, it suggested a 5 per cent risk weight for government and approved securities, with a view to countering the tendency of banks to over-invest (i e, beyond the SLR limits) in such 'riskless' securities. Thirdly, it drew pointed attention to the need for including off-balance sheet (OBS) items (such as contingent liabilities in terms of various types of swaps and hedging operations, derivative trades) in the definition of capital adequacy. Finally, the Committee recommended the raising of the capital to assets ratio to 10 per cent from 8 per cent, with the achievement date fixed at 2002. The rationale for this hike is set out as follows. "International experience has shown that in several developing countries, due to economic factors like the greater volatility and consequently higher risk in the environment in which they operate and because of institutional factors such as legal impediments to loan recoveries and weaknesses in accounting practices, capital adequacy ratios need to be set at higher levels than the ratios prevailing in developed economics even as the definition of capital adequacy has to be more exacting and risk weights are set at higher levels."

II
Bank Portfolio Response to CARs

It is ironic that while the drift in regulatory opinion has shown a marked shift in the direction of mandatory capital adequacy ratios (CARs), the theoretical case for such ratios rests on extremely weak foundations. The theoretical literature has addressed itself to three issues. (i) the impact of CARs on the portfolio behaviour of banks; (ii) the impact of CARs on the failure probability of banks; and (iii) the examination of other methods of capital regulation

We begin by a careful examination of the first of the above issues in this section. To illustrate the main results, we resort to the basic model of portfolio behaviour of a depository financial institution due to Pyle (1971) and Hart and Jaffee (1974). The four critical assumptions underlying this model are: (i) total bank size is assumed to be under the control of bank management; (ii) the return paid to depositors is riskless; (iii) deposit insurance is absent; and (iv) risk and return per unit of capital are unaffected by bank size, i e, the market for assets is competitive.

Let x_0 denote the percentage of bank's capital K held in the form of deposits paying the risk-free rate R. Let x_i be the percentage of capital invested in the i^{th} asset (i=1,2....n), with E_i the expected return on the i^{th} asset. σ_{ij} is the covariance of returns between i^{th} and the j^{th} assets and $\sigma_{ii} = \sigma_i^2$ the variance of return on the i^{th} asset. Further E_p and σ_p^2 denote the expected return and variance of return (per unit of capital) on the bank portfolio, then (taking x_0 with a negative sign), we have

$$\sum_{i=0}^{n} x_i = 1 \qquad (1)$$

$$E_p = x_0 R + \sum_{i=1}^{n} x_i E_i \qquad (2)$$

We assume that the bank has a general risk averse utility function defined on end of period capital

$$U = U(K + R_p K) \qquad (3)$$

where R_p is the actual return (as opposed to expected return E_p) on the bank portfolio.

The bank's optimum portfolio is then obtained by maximising (3) subject to (1) and (2). However, if a capital to asset ratio is fixed by the regulator at c, then we have the additional constraint

$$x_0 \geq 1 - 1/c \qquad (4)$$

It can be shown [Merton 1972] that the optimum portfolio is given by

$$x_i^* = \frac{AC\left(\frac{1}{b} - 2R\right) \quad C(1+B)^* \frac{1}{c}}{C + D}\left[\frac{\sum_{j=1}^{n}(E_j - R)}{A} \frac{\sum_{j=1}^{n}\sigma_{ij}}{C}\right] + \frac{\sum_{j=1}^{n}\sigma_{ij}(E_j - R)^* \frac{1}{c}}{A} \quad i = 1, 2, \ldots n \qquad (5)$$

where A,B,C and D are all positive constants, and the parameter b is the coefficient of relative risk aversion of the utility function (3).

The effect on the composition of the bank's portfolio of changes in c can now be simply evaluated by differentiating the expressions in (5) with respect to c. Further insight is gained [Koehn and Santomero 1980] by introducing two new concepts, viz. ε_{ic} (the elasticity of proportionate demand for the i^{th} asset with respect to the CAR c) and σ_{ip}, the covariance of returns of the i^{th} asset with the entire portfolio. Koehn and Santomero (1980) prove the interesting result that

$$\varepsilon_{ic} > \varepsilon_{jc} \text{ iff } \sigma_{ip} > \sigma_{jp} \qquad (6)$$

This establishes the interesting conclusion that the effect of an increase in C is to shift the equilibrium portfolio in favour of relatively more risky assets.[1]

What is remarkable about the above conclusion is its robustness. Firstly, as James (1976) has shown, it holds even if market imperfections are introduced. Secondly, fixed-rate deposit insurance (the most typical in practice) coupled with CARs reinforces the shift in favour of riskier assets [Rochet 1992] provided markets are complete and contingent (in the Arrow-Debreu sense) It is only when the deposit premia on banks are risk-related, can CARs achieve their intended purpose. Thirdly, even in the more realistic situation of a bank's equity capital being fixed in the short run, CARs can be shown to be ineffective [Kim and Santomero 1988], unless the risk-weights on assets correctly reflect systematic market risks of the assets.[2] Finally, if we introduce the feature of limited liability, the situation becomes much more complicated. Rochet (1992) demonstrates that in such a context, the mere imposition of CARs, even if they reflect correct risk-weights, is no guarantee against risk-loving behaviour by banks – at the least CARs have to be supplemented by restrictions on the minimum level of capital.

The resolution of the paradoxical result of a positive association between capital adequacy ratios and risk assumption by banks, lies in the fact that CARs cause bank leverage and asset risk to become substitutes; thus, banks experiencing reductions in leverage (regulatory increases in CARs) will achieve the desired total risk level by increasing asset risk [Shrieves and Dahl 1992].

It is interesting to note that the options theory of finance arrives at a conclusion diametrically opposite to the one stated above. Several authors in this tradition [Kareken and Wallace 1978; Black et al 1978; Benston et al 1986] maintain that

maximising the value of bank shareholders' equity entails maximisation of the option value of deposit insurance through increasing leverage and asset risk. The associated benefit to bank shareholders is termed the 'deposit insurance subsidy'. Bank capital regulation then acts as a check on the tendency of banks to exploit this deposit insurance subsidy and reduces the risk exposure of banks [see Keeley and Furlong 1990 for a formal demonstration of this result].

The major problem with the options pricing view seems to be its premise that banks maximise net shareholder value. This objective may adequately describe mutual fund behaviour but banks are far more concerned with avoiding insolvency than with maximising shareholder returns. Recently, Saunders et al (1990) have provided a vindication of this view in terms of agency theory. They argue that bank managers as agents of stockholders, have an incentive to reduce the risk of bank insolvency well below the levels desired by stockholders, since managers have considerable sunk human capital in banks, and hence stand to lose a great deal personally in the event of bank insolvency. At best, the options pricing result can be regarded as a mitigating factor in our main conclusion of a positive association between risk and regulatory capital [Shrieves and Dahl 1992].

The limited amount of empirical evidence that is available in the US seems to reinforce the futility view of CARs. Peltzman (1970) using data for a selection of US banks in the mid-1960s found bank regulation to be ineffective. A more recent study [Shrieves and Dahl 1992] pertaining to a cross-section of 1,800 banks in the US over 1984-86, reached substantially similar conclusions, indicating substitution at the margin between leverage and asset risk. Recent results for the UK are however supportive of the effectiveness of regulatory capital. (An empirical study for Indian banks is currently under way by the author.)

III
CARs and Bank Failure Probability

It is one of the avowed purposes of bank regulation to avoid the probability of bank failure. To evaluate the effects of bank capital regulation, it is thus necessary to derive an explicit relationship between bank portfolio risk, bank capital and the chance of bankruptcy. We once again resort to the basic theoretical model discussed above. The efficiency frontier shows all combinations of portfolios which generate maximum expected return for a given level of risk. This frontier will appear as an upward sloping (concave from below) locus in the risk-return space (E_p, σ_p) – further, the bank will have an indifference map between E_p and σ_p, spelling out the bank's risk attitude. These indifference curves will be upward sloping (convex from below) and the point of tangency between the efficiency frontier and an indifference curve will depicit the equilibrium of a bank for a given CAR c (this equilibrium point is denoted by A in Figure). An important result by Merton (1972) demonstrates that an increase in c will have the effect of forcing the efficiency frontier downwards and to the left. (In Figure, EF and E'F' refer respectively to the efficiency frontiers before and after an increase in the CAR c).

We define bank failure to occur, if, in any period the bank's losses exceed its total capital, i e, if $R_p<-1$ (in terms of the notation introduced earlier). Following Blair and Heggestad (1978) we may now invoke the Chebysheu Inequality to write

$$\text{Prob}\ [\,|R_p - E_p| > k\sigma_p] \leq 1/k^2 \qquad (7)$$

$$\text{Or}\quad \text{Prob}[R_p<-1] \leq \sigma_p^2/(E_p+1)^2 = P_f \qquad (8)$$

(in putting $k\sigma_p - E_p = 1$, so $k=(E_p+1)/\sigma_p$)

The right side of (8) represents an upper limit on the probability of failure which we denote by P_f. The line DD in Figure shows all combinations of σ_p and E_p along which P_f remains constant. (Note that the slope of DD is $1/\sqrt{P_f}$ and its intercept is –1) All points to the left (right) of DD exhibit failure probabilities lower (higher) than P_f.

The original bank equilibrium is at A. Suppose that the CAR c is now increased so that the efficiency frontier drops from EF to E' F'. If the risk-return ratio had remained unchanged the new equilibrium point would have been A' and the failure probability would have decreased [an old result due to Roy 1952]. But as we have seen in the previous section, there is likely to be a shift to riskier assets, i e, the new equilibrium will be on the frontier E'F' of course, but to the right of A' at a point like A^+ or A^*. If the new equilibrium is at a point like A^+ to the left of DD, the probability of bank failure has decreased but if A^* is the new equilibrium, then failure probability has actually increased after increasing the CAR c. Whether the shift will occur to a point such as A^+ or A^* will depend upon b the coefficient of relative risk aversion. The higher the value of b, the smaller the distance of the new equilibrium from A'. Thus low values of b make it highly probable that bank failure might result from increases in the CAR.

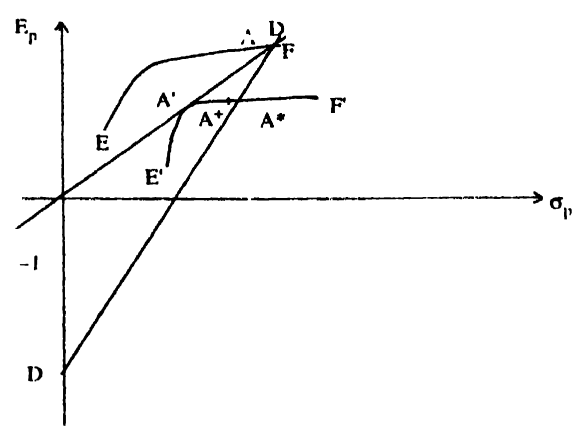
This last conclusion taken in conjunction with (6) has important implications for the health of the banking system as a whole – for highly risk-averse banks the elasticity of high risk assets is lower than the corresponding elasticity for other less risk averse banks. Thus, banks initially holding relatively more risky assets per unit of capital, offset the capital restrictions to a greater extent than their more conservative counterparts. This has the effect of increasing the risk dispersion across the industry as a whole, accentuating the probability of failure of the riskier institutions and thereby jeopardising the health of the entire banking industry.

IV
Alternate Arrangements

Value-at-Risk (VaR) Models

It is important to emphasise that the preceding discussion should not be construed as a position against adequate bank capitalisation. Rather, our scepticism is constricted to the instrumentality of CARs

Figure



as a method for achieving this purpose. Two alternative arrangements have emerged in the literature, viz, Value-at-Risk (VaR) Models and the Pre-Commitment Approach (PCA). These two arrangements are now taken up for discussion.

The VaR model retains the basic CAR philosophy of a 'hard link' between risk exposure and capital requirements set exogenously by a regulator. However there is an important difference. In the traditional CAR approach, the risk weights are also set by the regulator whereas in the VaR approach, the risk weights are based on the banks internal model. This amendment is addressed to overcome two weaknesses of the CAR approach – one, that it ignores the diversification benefits accruing from holding assets of varying risk in the same portfolio and two, that it fails to efficiently exploit internal information specific to the bank. However, the VaR model comes with its own price tag. The regulator has to ensure that the bank's internal model does not misrepresent its risk exposure, and hence a checking mechanism has to be in place.

VaR framework: The analytics of the VaR model is relatively straightforward. Let x_t denote the log of portfolio value at time t, the k-period ahead porfolio return is $r_{t+k}=x_{t+k}-x_t$. The probability density function (pdf) of r_{t+k} based on the information available at time t, will be denoted f_{t+k}. In its broadest terms, the VaR model M of the bank is simply a specification of this pdf which we will denote $f_{t+k,M}$. We next define $VaR_{MT}(k,\alpha)$ as the critical value corresponding to the α per cent tail of $f_{t+k,M}$. Put differently, the VaR estimate $VaR_{MT}(k,\alpha)$ is the forecast of the maximum portfolio loss that could occur over the maximum holding period with the specified confidence level.

The 1996 market risk amendment (MRA) to the 1988 Basle Accord lays down the standard parameters of k and α at respectively k=10 days and α=1 per cent. A bank's market risk is thus defined as its own estimate of the maximum potential loss that would occur over a two week period (10 working days) at 1 per cent confidence level. The MRA further stipulates that for the period (t+1), the bank must hold market risk capital (MRC) set equal to the larger $VaR_{MT}(10,1)$ or a multiple of the average of the previous 60 $VaR_{MT}(10,1)$ estimates, i e.

$$MRC_{t+1} = \max[VaR_{Mt}(10,1);\ S_{mt}^{*}\frac{1}{60}\sum_{i=0}^{60} VaR_{M(t-i)}(10\ 1)]' \qquad (9)$$

where S_{MT} is a multiplicative factor greater than three [Hendricks and Hirtle 1997].

Model accuracy: Model accuracy is judged by studying the 1-day ahead forecasts at 1 per cent level of significance, i e, from the estimates $VaR_{MT}(1,1)$. At any given time t, we observe returns r_{t-i} over the previous 250 trading days. An exception is said to occur whenever r_{s+1} has been less than $VaR_{MS}(1,1)$, s=t-i, i e, whenever past losses have exceeded the maximum estimated losses. If four or fewer exceptions occur the model is said to be 'acceptably accurate' or in the green zone. The yellow zone comprises between five to nine exceptions. With more than 10 exceptions the model enters the red zone and is deemed inaccurate. The value of the multiplier, S_{MT} is fixed at its minimum of three in the green zone and at its maximum of four in the red zone. In the yellow zone it increases from three by 0.2 for every exception beyond the fourth.

Model evaluation: Under the MRA, banks are supposed to report their VaR estimates to the regulators, who observe whether actual portfolio losses are in excess of these estimates. Regulators will need at their disposal more formal and objective methods of judging model accuracy than the rather informal criteria discussed in B above. Several methods may be invoked, but the two most commonly in use are the binomial distribution method and the interval forecast method.

The binomial method [due to Kupiec 1995] states that under the null hypothesis that the model H is accurate, the exceptions can be modelled as independent drawings from a binomial pdf with =0.01. The probability of observing x exceptions in a sample of 250 is then

$$P(x)=(250C_x)(0.01)^x(0.99)^{250-x} \qquad (10)$$

The appropriate likelihood ratio statistic for testing whether the proportion of exceptions e = x/250, is in fact equal to the level of significance α=0.01 – used in (9) – is then given by

$$LR_B = 2[\ln\{\ln(e^x(1-e)^{250-x}\} - \ln\{(0.01)^x(0.99)^{250-x}\}] \qquad (11)$$

which is a uniformly most powerful test and follows a χ^2 distribution with 1 df. The bank's internal model is deemed inaccurate if LRB is significant at 1 per cent level.

One drawback of the LR_B test is that it is an unconditional test as it simply counts exceptions over the entire period but ignores the variance dynamics. This may lead the method often to wrongly classify a model as 'acceptably accurate'. Christoffersen (forthcoming) has suggested a simple modification to overcome this shortcoming. He defines an indicator variable $I_{M,T+1}$ by

$$I_{M,t+1} = 1 \quad \text{if } r_{t+1} < VaR_{Mt}(1,1) \text{ and}$$
$$= 0 \quad \text{otherwise} \qquad (12)$$

If the VaR estimates are conditionally correct, the series $I_{M,T+1}$ must exhibit both correct unconditional coverage as well as serial independence [Lopez 1998]. We can thus define the following statistic

$$LR_c = LR_B+LR_I \qquad (13)$$

Where LR_I is the likelihood ratio statistic for the null of serial independence, against the alternative of a first-order Markov scheme. The statistic LR_c is distributed as a χ^2 (2).

Limitations: There are several limitations with the VaR approach. For one it entails supervision on a day-to-day basis to ensure that portfolio valuations are not fudged. There is also the problem of separating forecast errors arising from model deficiencies from those arising in response to changed economic structures. Further, the estimated risk under VaR resorts to fixed parameters and does not incorporate extra information about features such as future credit and liquidity conditions that might be available to the manager. By imposing an arbitrary holding period of 10 working days, the VaR approach fails to allow for managerial expertise in the optimal choice of the holding period itself. Thus, the VaR estimates may often overstate capital requirements.

In view of the several difficulties noted above, the Narasimham II Report (1998), while endorsing the MRA, cautions against a premature adoption of the VaR model. Instead they suggest "a standard measurement method which uses a building block approach in which specific risk and general market risk arising from debt and equity positions are calculated separately" (p 20).

The Pre-Commitment Approach

Framework of PCA: In contrast to the CAR approach and the VaR amendment to it, the PCA propounded by Kupiec and O'Brien (1997) relies on the use of a 'soft link', i e, a link arising endogenously rather than being externally imposed. The link between exposures and back-up capital is sought to be enforced by the threat of penalties whenever trading losses exceed a level prespecified by the bank.

Thus, under the PCA, banks are asked to specify a level of capital *ab initio* for a given period of time (say one quarter). If the cumulative losses of the bank exceed the chosen level of capital during this period, then the banks are subjected to

penalties. The task of the regulator is then to impose a schedule of penalties which will provoke a desirable choice of capital for varying levels of risk. The appeal of the PCA lies in the fact that it does not require the regulator to estimate the level of trading book risk of any specific bank or to assess its internal model. This 'hands off' regulatory approach gives the banks much greater freedom in choosing their portfolios, while simultaneously contributing to more efficient use of information (since banks are much more likely to be adept at estimating risks of trade than the regulator) [Daripa and Varotto 1998].

As before, let r denote the return on assets in the bank's portfolio and f(r) its pdf. Further, let k denote the precommitted capital of the bank. Thus a penalty falls due if the bank's net return falls below (–k). There are only two cost factors in this model – the cost of raising capital and the expected cost of the penalty. Assuming that the penalty imposed is proportional to the loss in excess of the capital cover k, the total cost function may be written as

$$C(k,p) = ak - p\int_{-\infty}^{-k} (r + k)\, f(r)dr \qquad (14)$$

where p is the penalty and a the cost of raising a unit of capital.

The optimal level of capital is now given by taking the first derivative wrt k of (14), i e,

$$\frac{\partial C(k,\ p)}{\partial k} = a - p\ F(-k) = 0 \qquad (15)$$

where F(r) is the cumulative density function of r. Equation (15) determines the optimal capital k as the solution k* given by

$$k^* = -F^{-1}\ (a/p) \qquad (16)$$

Equation (14) bears out our a priori expectation that k* (the optimal pre-committed capital) declines as the cost of raising capital a increases, but increases as the penalty p increases. Kobayakawa (1998) extends the above result in an important direction. He shows that there is a range of penalty values $[p_1, p_2]$ such that

(i) if the actual penalty p is lower than p_1, it has no impact on the level selected of the precommitted capital;

(ii) if $p \in [p_1, p_2]$ then banks with riskier asset portfolios are induced to hold higher capital than banks with more conservative portfolios; and

(iii) if p exceeds p_2, then banks with more conservative portfolios hold higher capital than those with risky portfolios.

The last result serves to underline the fact that too heavy penalties defeat the very purpose of capital regulatory requirements.

Limitations: One basic limitation of the PCA is that it considers the bank as a single entity and ignores the so-called 'agency problem'. An agency problem arises whenever ownership is divorced from operational decision-making. The ignoring of the agency problem under a hard-link arrangement may not be a serious matter but under a soft-link arrangement, agency problems can pose a compelling challenge.

An integral feature of large modern banks is the separation of owners from managerial decision-making. Managers cannot usually be fined in the event of a loss. Thus decisions about portfolio risk are taken by managers with strictly limited liability, while the owners have to suffer not only the trading book losses but also pay the penalty in the event of a breach under PCA. Daripa and Varotto (1998) suggest an interesting arrangement aimed at alleviating agency distortion. Their arrangement rests on two key insights, (i) a soft-link maintains flexibility but entails loss of control by the principal over the manager (agency problem) and (ii) a hard link permits full control but suffers from the drawback of inflexibility. The actual arrangement suggested is as follows: (1) regulate according to PCA to begin with; (2) in any period t, regulate according to PCA, if no breach has occurred in period (t-1); and (3) if a breach has occurred in period (t-1), adopt a hard-link approach (of the CAR or VAR variety) for periods t, (t+1)...(t+T), and then switch back to PCA. This scheme establishes a trade-off between current and future risk and thereby controls agency distortion. Higher risk taking in period t raises the possibility of a PCA breach and increases the choices of facing a hard-link regime for T future periods that would put limits on managerial risk-taking. Put differently, a defaulting bank must go through a 'probationary' phase when its risks would be rigidly monitored.

Empirical feasibility: Lest it appear that the PCA is pure academic esoterica we conclude this section by describing an important attempt to examine its implementability. An international group of 10 banking organisations participated in this pilot project under the aegis of the New York Clearing House Association. Among the participating institutions were the Bank of America, the Chase Manhattan, Fuji Bank, Citicorp, J P Morgan and Company, etc. [Considine 1998]. The pilot project's main conclusions were as follows:

(i) The PCA is a viable alternative to the CAR and VaR approaches. With proper structuring and refinements, it could be implemented as an alternative not a supplement to existing capital standards.

(ii) The scale of penalties for defaulters was a question of critical import.

(iii) Finally, although the PCA was originally designed for the market risk of banks, its potential applicability is much wider. In fact apart from market risk, it could also be applied to operational, legal, settlement and other types of risks. The PCA avoids several complications and inefficiencies involved in setting capital charges separately for each category of risk while providing incentives to ensure the maintenance of minimum prudential standards within the industry.

V
Conclusions

While adequate bank capitalisation is desirable and even necessary do capital adequacy ratios ensure it? A perusal of the theoretical literature and the available (admittedly limited) evidence pertaining to advanced countries (mainly the US) reinforce these misgivings. Alternate arrangements such as Value-at-Risk models and Pre-Commitment models are then taken up for examination. The VaR perseveres with the 'hard-link' arrangements between risk exposures and back-up capital envisaged under the standard CAR regime but introduces a degree of flexibility by allowing banks to reveal the riskiness of their portfolios to the regulator via internally generated models. By contrast, the PCA substitutes an endogenously generated 'soft-link' between risk exposure and capital for the exogenously imported 'hard-link' of the other two approaches. There is some evidence to substantiate the empirical plausibility of the PCA.

However, considerable caution needs to be exercised before we extrapolate the scepticism about CARs (based on advanced country experience) to the Indian context. The Indian banking system is predominately a public sector one, the incentive structures in which might differ significantly from those prevailing under private sector banking. Secondly, the system of directed credit endemic to Indian banks severely constricts their risk-taking abilities. Thirdly, a feature inherited from a long history of regulated interest rates is that market risks are not accurately mirrored in interest spreads. Fourthly, accounting norms are as yet in an evolving stage so that the kind of sophisticated and frequent monitoring required by the VaR and PCA approaches may pose problems. The imposition of penalties for default under PCA would require a separate regulatory authority 'with teeth' – the present Board for Financial Supervision may prove inadequate for the task.

The above questions are in urgent need of both theoretical and empirical answers. Till such answers are forthcoming, it would of course be premature to recommend any pronounced shifts in the current capital regulatory arrangements. But a headlong rush along the Basle path of inflexible CARs, which the Narasimham II Committee seems to advocate is equally inadvisable. After all the chairman of the Basle Committee, W P Cooke, had himself said, "There is no objective basis for ex-cathedra statements about levels of capital. There can be no certainty no dogma about capital adequacy" [Cooke 1981].

Notes

[I wish to thank Sangita Kamdar, R Laxmi, Brinda Jagirdar and M Ramchandran for several useful comments and suggestions, while retaining full responsibility for any errors.]

1 A few readers of this paper have commented that the increased investment by banks in government securities in the last few years negates our major premise that CARs induce shifts to riskier assets. This is not necessarily so. The phenomenon could equally well reflect the fact of 'credit rationing' in a high interest rate environment *a la* Stiglitz and Weiss (1981).

2 There is a fundamental asymmetry problem here. The bank may be a much better judge of the systematic market risks of its asset holdings than a regulator. Further, since the nature of banking business varies widely, this feature argues for bank specific CARs, rather than a uniformly specified risk-weight structure for the entire banking sector.

The Indian commercial banking sector is characterised by both a high average non-performing share in total bank advances and a high dispersion between banks. This paper presents the findings of a formal attempt to explain inter-bank variations in NPAs for the year 1996-97. The specification tests for the impact of region of operation on domestically-owned banks, as measured by percentage branches in each of a set of state clusters. One cluster of three eastern and seven north-eastern states carries a robust and statistically significant positive coefficient; another cluster of the southern and some of the northern states carries a significantly negative coefficient. These findings bear out those of Demirguc-Kunt and Huizinga on the significance of the operating environment for bank efficiency. No sustainable improvement in the performing efficiency of domestic banks is possible without prior improvement in the enforcement environment in difficult regions of the country. Another finding of some importance is that it is not foreign ownership in and of itself so much as the banking efficiency and technology correlates of the country of origin of the foreign bank which determine NPA performance in the Indian environment.

I
Introduction

THE non-performing share in total bank loans is an important indicator of banking health. The NPA ratio in aggregate at country-level is of interest in the first instance, as a macro financial indicator. The high share of NPAs in the Indian banking sector in aggregate has been of concern for some time. This was among the variables targeted for phased reduction by the *Report of the (Tarapore) Committee* as a prior requirement for full rupee convertibility,[1] although subsequent to the *Report* the goal of full convertibility itself is less universally endorsed. But clearly the urgent need for reducing NPAs survives the declining interest in having a fully convertible currency.

International cross-country variations in NPAs are of interest, but these are beset by definitional differences across countries. This may be one reason why international cross-section studies of banking performance are conducted more in terms of standardised measures such as interest spreads and bank profitability [Demirguc-Kunt and Huizinga 1998].

NPAs carry a possible definitional problem even over time within a country, and that is so for recent years in India when, in response to the recommendations of the Narasimham Committee, there has been a phased alteration of the definition of NPAs,[2] with at the same time a move to a net from a gross concept.[3] This process was completed only in 1994-95 so that the earliest post-reform year for India from which stability obtains after the definitional shake-out is 1995-96.

Bank-specific percentages of net NPAs to net advances for 1996-97,[4] range all the way from a low of zero per cent to a high of as much as 31 per cent. It is clearly to be expected that this variation would be explained to some degree by bank-specific efficiency and prudential indicators. The published averages by sub-sector also show sharp differences by ownership category. Thus for example the reported[5] sub-sector averages are 9 per cent for the 27 public sector banks; 6 per cent for the 25 old private sector banks; 2 per cent for the nine new private sector banks which came into existence after entry deregulation in 1992; and 2.5 per cent for the 39 foreign banks. The foreign banks include a mix of those that have operated in India for a very long time like American Express Bank, and eight recent banks which operated for the first time in 1996-97. Within the foreign bank category, there is again a high degree of variation in the NPA percentage, all the way from Bank of America with zero per cent to the Bank of Tokyo-Mitsubishi with 17.4 per cent, Mashreq Bank with 23 per cent, and the State Bank of Mauritius with 31 per cent. These NPA variations within foreign ownership suggest that the degree of development of banking techniques in the home country might matter as much as foreign ownership in and of itself. The sub-category averages also show a vintage effect which clearly contributes towards the much lower NPAs among domestic banks of very recent origin.

In addition, in developing countries as geographically dispersed as India, there should in principle be some impact of variations in the operating environment on observed NPAs. The 1998 *Report of the (Pannir Selvam) Committee* on NPAs of public sector banks mentions industrial and political unrest in some parts of the country among the contributory factors. Clearly, the variation across the country in the enforcement environment would affect all domestic banks, not just those in the public sector, although publicly-owned banks may suffer additional compulsions to expand into difficult regions of the country. Foreign banks have a largely metropolitan presence, and are to that extent immune to variations in the operating environment across the rest of the country. Were sub-nationally disaggregated indicators of performance for each bank available, this impact would be more transparently evident, but RBI bank-specific data are reported only in aggregate at national level. Further, where banks have nationally dispersed branches, it is not possible to construct sub-national aggregates by a simple grouping of the banks in each region, as is possible for example in countries like the US where banks are largely circumscribed regionally.

In what follows single-equation regressions on cross-sectional variation in NPAs for the year 1996-97 are reported, where the specification of the model tests for performance and ownership variations, along with the impact of regional location. The prior work on cross-sectional variation in Indian bank performance by Sarkar et al (1997), as also the international cross-sectional results of Demirguc-Kunt and Huizinga (1998), will be summarised in section II. Section III presents the empiri-

cal findings on factors explanatory of cross-sectional variation in NPAs in India. Section IV concludes.

II
Recent Cross-Sectional Examinations of Bank Performance

The 1998 study by Demirguc-Kunt and Huizinga (DKH) is the most recent, and certainly the most comprehensive ever, cross-country study of variations in bank performance, using two performance indicators separately regressed on a set of explanatory factors: the interest spread (used as an efficiency indicator) and bank profitability. The data set is at bank-level for 80 countries over the period 1988-95. The set of regressors includes both bank-specific characteristics (size, leverage, type of business, foreign ownership) as well as country-level variables which describe the macro-economic, legal and institutional environment.[6] The country-level variables are also interacted with the GDP per capita to capture the difference between their effects on the performance of banks in developed and developing countries.

Perhaps the most important finding pertains to the differences in the impact of foreign ownership between developed and developing countries. In developing countries foreign banks have greater interest margins and profits than domestic banks. In industrial countries, the opposite is true. The first finding bears out the better NPA performance by foreign banks on average in India, but does not bear upon the pattern of NPA variation within foreign owned banks in India by country of origin.

Among the macro variables reported by DKH to affect bank profitability positively although not net interest margins (the efficiency indicator), is per capita GDP.[7] These results suggest that per capita GDP may be less a correlate of banking efficiency or superior banking technology, and more a correlate of banking opportunities and the operating environment generally. However, this result conflicts somewhat with the (positive) significance of foreign ownership on both interest margins and profits in developing countries, where the better performance relative to domestic banks in a different host environment suggests that it is the superior banking technology in the country of origin of the bank (with, by definition, a higher per capita GDP) rather than the operating environment there that is the correlate of higher per capita GDP.

The conflict may arise from ambiguity of interpretation in the directionality of the net interest margin as a variable. A lower margin indicates greater banking efficiency under competitive circumstances and indeed this is borne out by the significant negative coefficient for competitiveness of the banking sector in the net interest regression. Other findings of the DKH study which support an inverse relationship between net interest and bank efficiency are that variations in overhead and other operating costs are reflected in variations in bank interest margins, as banks pass on their operating costs (including the corporate tax burden) to their depositors and lenders. On the other hand, a higher margin could indicate greater banking efficiency under segmented, or otherwise imperfectly competitive, market conditions, such as what perhaps characterises the operating environment in developing countries, and this is borne out by the positive significance of foreign ownership on interest margins in developing countries.

DKH also include a law and order index, where better law and order leads to lower interest margins on account of reduced risk premia on bank lending. There is also a corruption index (the index is so constructed that a high value reflects lower corruption in government). The results show that cleaner government is associated with lower realised interest margins and more so in poorer countries. Both these findings show an inverse relationship between the net interest margin and the efficiency of the operating environment.

The DKH findings thus suggest that any attempt to explain cross-bank NPA variations would do better to capture bank efficiency through operating profits or returns to assets which are less ambiguous in terms of direction than the net interest margin.

The Sarkar, Sarkar and Bhaumik (1998) (SSB) cross-bank study for India regresses two profitability and four efficiency measures (one of which is the net interest margin) on pooled data for two years, 1993-94 and 1994-95, for a total of 73 banks, using single-equation OLS estimation for each. The study focuses exclusively on an examination of the prediction from the property rights literature about the superiority of private ownership in terms of performance. Private banks are divided into traded and non-traded categories; the control variables include the (log of) total bank assets, the proportion of investment in government securities, the proportion of loans made to the priority sector, the proportion of semi-urban and rural branches and the proportion of non interest income to total income. The coefficient of foreign ownership is positive and significant at 1 per cent significance level for both sets of regressions. However the coefficient of private ownership is significant only for returns on assets (ROA). With respect to all the efficiency indicators, private domestic banks are no better than the public banks, thus

ROA, OPR:[8] foreign > private traded > private non-traded = public

NIM, OPSE, OCR, SER:[9] foreign > private traded = private non-traded = public

The coefficient of the foreign ownership dummy on the net interest margin is positive, in conformity with the DKH result for all developing countries.

Ajit and Bangar (1998) present a tabulation of the performance of private sector banks *viz-a-viz* public sector banks over the period 1991-1997, using a number of indicators: profitability ratio, interest spread, capital adequacy ratio, and the net NPA ratio. The conclusion is that Indian private banks outperform public sector banks. What is of interest, however, is that they find Indian private banks have higher returns to assets in spite of lower spreads. This finding emphasises once again the ambiguity of spreads as a measure of bank efficiency. Other findings of interest are that the wage bill is a major component of intermediation cost in public sector banks unlike for private banks, where it is the expenditure on capital equipment like computers, that is the major component.

Finally, Patel (1997) discusses banking reforms but does no empirical exercises. The central point made is that there should be an enabling framework for banks that ensures a sustained maintenance of their operational flexibility in an environment that is increasingly buffeted by domestic as well as international shocks.

III
Empirical Findings on NPAs

Bank-specific net NPAs (as a per cent of net advances) for the year 1996-97 were regressed on ownership and regional presence, controlling for bank-specific efficiency and prudential indicators relating to the same year, thus:

$$NPA9697_i = \alpha + \Sigma\beta_j O_j + \Sigma\gamma_k E_{ki} + \Sigma\delta_m (DS)_{mi} + \varepsilon_i; \quad i=1, \ldots 91$$

where

O_j : ownership intercept dummy; $j = 1, \ldots 4$

E_{ki} : set of bank-specific efficiency indicators; $k = 1, 2$

$(DS)_{mi}$: per cent branches in the mth state cluster of the ith domestic (D=1) bank; m=1, ...M

ε_i : residual

The NPA percentage pertains to operating assets alone (see note 2). All data were drawn from published RBI sources.[10] RBI data on Indian banks are classified by four ownership categories: old private domestic banks, new private domestic banks, domestic public banks and foreign banks. We have further subdivided foreign banks into one group of Asian and west Asia origin, and a residual group of other than Asian and west-Asian origin. There are two intercept dummies for these, and one each for new private domestic banks, and public sector domestic banks. The base intercept stands for old private domestic banks.

Data on NPAs are reported by the RBI for 1996-97 on 100 banks. Of these, eight new foreign banks[11] beginning operations in 1996-97 clearly had had no time to accumulate NPAs. These were therefore excluded. The State Bank of Mauritius had the highest reported NPA of 30.72 per cent, and also the highest capital adequacy ratio of 107 per cent.[12] This observation led to a spuriously high positive correlation between NPAs and capital adequacy, and therefore had to be dropped, leaving a total of 91 observations. The mean NPA ratio across all banks after exclusion of the outlier is 6.10 per cent (the corresponding absolute figure is Rs 22,349 crore). Descriptive statistics on NPA9697 and all independent variables other than regional branch presence are in Appendix I.

The capital adequacy (capital to risk-weighted assets) ratio is the prudential indicator. Although all banks were required to adhere to the 8 per cent norm by March 31, 1996, there were several that fell below,[13] and a surprising degree of variation above the required level as well (Appendix I).[14] Of the four bank-specific operating indicators reported by the RBI (Appendix I), the net interest margin was rejected because of its ambiguity (see section II), and business per employee because it is an indicator of staffing efficiency alone. Operating profit, which is reported in India as a percentage of working funds, rather than return to assets (ROA) was used as a performance indicator for two reasons. ROA includes return on non-operating assets, which is not indicative of operating efficiency and therefore less suitable as a factor explanatory of non-performing operating assets. At the same time, provisioning for non-performing loans is deducted from ROA, making for a built-in negative relationship between NPAs and ROA. However, one of the specifications tried does substitute ROA for operating profit; the results are reported alongside. By directly taking a performance indicator as an explanatory variable, the specification subsumes factors such as bank size, proportion investment in government securities and proportion of non-urban branches found by SSB (1998), to be significantly explanatory of performance.

Regional presence is quantified by taking the total number of branches in each state as a percentage of the national total. The statewise break-up of total advances at bank-level would have been a better measure of regional presence, but was not available. To avoid the distortion arising from the foreign bank presence in large metropolitan cities of some states (Calcutta in West Bengal, Mumbai in Maharashtra), the percentage of branches in each state was interacted with a dummy variable for domestic banks (private plus public). Thus, the coefficients of all regional presence variables apply to domestic banks alone.

The correlation matrix between NPA9697 and percentage branches by state (DASSAM is for Assam after being interacted with the dummy for domestic ownership) is presented in Appendix II. The states have been ranked roughly (though not exactly) in descending order by the correlation coefficient with NPA9697. The sequence of states, starting with Assam which has the highest correlation coefficient of 0.5178, shows a marked regional clustering in terms of both correlation with NPA9697, and cross-correlations between branch presence. These are simple correlation coefficients, but even so show clearly that a regression specified by branch presence in each state taken separately would suffer from multicollinearity in branch presence

(2) The threshold values for the F-statistic at P=0.01 lie between 2.82 and 2.66 for (8,82); between 2.50 and 2.34 for (11,79).
(3) The critical values for the t-statistic (df=60; one-tailed) are 1.671 for P=0.05; 2.000 for P=.025; 2.390 for P=0.01.

between states within a region. There is a clear cluster consisting of north-eastern and three eastern states (Bihar, West Bengal and Orissa) with correlation coefficients between 0.30 and 0.50 with NPA9697. All the three eastern states of Bihar, Orissa and West Bengal have coefficients of 0.39 or more. There are two exceptions in the northeastern group, Arunachal and Mizoram, with correlation coefficients lower than the mean for the region, but the contiguity factor makes for strong cross-correlations with branch presence in adjoining high-coefficient states. The next highest coefficient after the east/north-east cluster is 0.20 for UP, which with Madhya Pradesh and Himachal Pradesh constitutes a natural cluster.

At the other extreme are Goa, Chandigarh and Delhi, with negative correlation co-efficients below -0.21. This group is not characterised by contiguity but clearly carries other similarities in terms of size, urban percentage, and most importantly, per capita income (Appendix II). There is also a fairly high correlation of branch presence between Delhi and Chandigarh. The four southern states and Maharashtra, Gujarat, and Punjab carry smaller negative coefficients, and Haryana is close to zero.

Based on these correlation coefficients, an initial set of five regional clusters was devised, thus: one grouping the three eastern and seven north-eastern states; one of UP, MP and HP; one of Gujarat and Maharashtra; one of Delhi, Chandigarh, Haryana and Punjab; one of the four southern states and Goa. Table 1 reports five regressions. The first four have four ownership dummies; the capital adequacy ratio and operating profit as control variables; and domestic branch presence in varying regional clusters. A fifth run substitutes ROA for operating profit as a control variable.

The first run includes all five of the initial regional clusters. Of the ownership dummies, new domestic private banks carry a negative coefficient significant at P=0.01. This is the vintage effect within the class of domestic banks. Public sector banks as expected carry a positive co-efficient, but it falls well short of significance at P = 0.05. The coefficient of foreign banks of Asian/west-Asian origin on the other hand is not significantly different from zero, while other foreign banks carry a negative coefficient significant (almost) at P=0.05. Of the two control variables, the capital adequacy ratio carries a negative coefficient significant at P=0.01. Operating profit (as a per cent of working funds) is not significant.

Of the five regional clusters, the east/north-east cluster alone carries a statistically significant (at P=0.05) coefficient, with a positive sign as expected. The HP/MP/UP cluster carries a positive coefficient, but it is not significant. The DCHP (Delhi/Chandigarh/Haryana/Punjab) cluster and the south/Goa clusters carry negative coefficients as expected, but neither is statistically significant. The Gujarat/Maharashtra cluster carries a positive coefficient, which even though insignificant, runs contrary to prior sign expectations.

This last (western) cluster along with the HP/MP/UP cluster was dropped therefore in the second run, and the two clusters with negative coefficients were grouped together in a single cluster. This new state grouping carries as expected a negative coefficient, significant at P=0.05. Further augmentation of this cluster with Maharashtra (not reported in the table), greatly increased the standard error and reduced the t-value of the cluster coefficient to near zero, undoubtedly because of the considerable variation within Maharashtra between location in Mumbai and environs, and location elsewhere. A final cluster adding Gujarat alone to the south/Goa/DCHP cluster further improves the statistical significance of the cluster coefficient (run 3). The adjusted R^2 of this specification is 48.23 per cent and the F value of 11.48 is much above the critical value for significance at P=.01.

Comparing runs 1, 2 and 3, the co-efficient of the east/north-east cluster remains stable, alongwith its level of significance, across the redrawn boundaries of the other cluster/s. When the east/north-east cluster is defined to exclude Arunachal and Mizoram, which had lower than average correlations with NPA for the region, with all other variables remaining the same (run 4) the coefficient of the cluster and t-value remain unchanged relative to run 3, and there is only a very slight improvement in the statistical significance of the regression.

The substitution of ROA for operating profits improves the regression further (run 5). The coefficient of capital adequacy remains stable and ROA now carries a negative and significant coefficient where operating profits did not. This is to be expected and does not add very much to the explanatory value of the regressions.

The approach to the identification of state clusters in this paper has deliberately been entirely empirically driven. Just as aggregate country-level NPAs over time would display sensitivity to macro-economic conditions, it is only to be expected that in a large and economically uneven country like India, interregional disparities in per capita domestic product would be an important factor explanatory of inter-bank variations in NPAs. But it is very clear from the clusters driven by the empirics of this variability that income is by no means the only factor uniting the states in each cluster. The ranking of states by per capita domestic product for the most recent year for which data are available for all states is given in Appendix III. The cluster of states positively related to NPAs includes Bihar, Tripura and Orissa at the bottom of the ranking, but includes Assam which is much higher ranked in terms of income than states such as MP, Rajasthan and UP which do not belong in the cluster. Likewise, the cluster identified in the regressions as negatively related to NPAs includes states/union territories at the top of the ranking such as Delhi, Goa and Punjab, but excludes for example Arunachal Pradesh which is higher ranked than the southern states in the cluster.

The pattern of coefficients of the intercept dummies and the control variables across runs is remarkably stable, except that with the transition from the first to the second specification the negative co-efficient for foreign banks of other than Asian/west-Asian ownership becomes significant at P=0.01. The coefficient for Asian/west-Asian foreign banks remains consistently insignificant. Thus, there does exist a statistically significant difference between foreign banks classified by region of origin, with those originating in Asia/west Asia clearly performing no better than domestic (old) private banks. The positive co-efficient of public sector banks improves in significance to P = 0.05 in runs 3 and 4.

IV
Conclusions

That NPAs as a per cent of bank advances of Indian commercial banks vary cross-sectionally by ownership category is already known from the sub-category averages reported by the RBI. This paper presents the findings of a formal attempt to explain inter-bank variations in net NPAs for the year 1996-97 through a specification which includes intercept dummies by ownership category; bank-specific prudential and efficiency indicators; and region of operation, as measured by percentage branches in each of a set of state clusters (this variable applies to domestic banks alone). The branch presence measure used here was the only available

indicator of regional exposure since banks do not report the distribution of total advances by state. The best specification explains about half of the total inter-bank NPA variation.

This paper adds to the conventional ownership categories a further distinction between foreign banks by country of origin of dominant ownership, in order to test whether it is foreign ownership in and of itself or the banking efficiency and technology correlates of the country of origin of the foreign bank which determine NPA performance in the Indian environment. Foreign banks of Asian and west-Asian origin performed no better than (old) domestic private sector banks in terms of NPAs. Foreign banks originating elsewhere did perform better. The significant negative coefficient of new private sector banks captures a vintage effect within the domestic private sector category. Finally, public sector banks carry a positive and significant coefficient.

Capital adequacy, a prudential indicator, carries a negative and significant coefficient. Operating profit as a percent of working funds was used as a performance indicator but was consistently insignificant as a variable explanatory of NPAs. The substitution of this by return on assets improved the statistical results, but did not add to the explanatory value of the exercise, since the required deduction of provisioning for non-performing loans from return on assets makes for an in-built negative relationship between the two. The net interest margin was not used as an explanatory variable since there is an inherent ambiguity of interpretation regarding its directionality.

One region of operation as measured by branch presence as a per cent of the national total carried a statistically significant positive coefficient. This cluster of Bihar, Orissa, West Bengal together with the north-eastern states shows a 0.07 increase in per cent NPAs for every per cent increase in branch exposure; the coefficient is significant at P=0.05, and is robust across variations in specification. The cluster accounts on average for 7.22 per cent of domestic bank branches. Another cluster of the four southern states together with Goa, Delhi, Chandigarh, Punjab, Haryana and Gujarat shows a 0.03 decrease in per cent NPAs for every per cent increase in branch exposure, significant at P=0.05. This cluster accounts on average for 56.07 per cent of domestic bank branches. The formation of these clusters was entirely empirically driven. Per capita income (state domestic product) is one factor uniting the states in each cluster, but an approach to cluster formation based purely on rankings by domestic product carries poor explanatory value. An independent approach to cluster formation that might have carried better explanatory value than income might have been through a calibration of states on a law and order scale, but this was not attempted. Law and order measures suffer from a variable censorship threshold.

The findings show that bank-specific characteristics such as ownership or adherence to prudential norms do not suffice to explain inter-bank variability in NPAs. The region of operation matters.

The importance of the operating environment has been highlighted by recent empirical findings, most notably those of Demirguc-Kunt and Huizinga (1998), whose 80-country cross-sectional bank-specific regressions show that better law and order and lower corruption lead to lower net interest margins (on account of reduced risk/corruption premia in lending rates). However, the ambiguity of interpretation in the context of other findings of that study regarding the directionality of net interest margin as an indicator of bank efficiency makes that a less compelling finding than if NPAs were the variable explained. Definitional differences make a cross-country study of NPAs all but impossible, but within-country cross-sectional or time-series analysis testing of

Notes: All data relate to the year 1996-97 and are at bank-level; the number of banks in each category is indicated. The data exclude one outlier bank of foreign Asian origin (see text).

NPA9697 : percentage of net NPAs to net advances for the year 1996-97.
Per cent Capadeq : capital to risk-weighted assets.
Per cent Opprof : operating profits to working funds.
Per cent Retass : rate of return to assets.
Per cent Netint : net interest income to working funds.
Bus/emp : business per employee (Rs).

Source: *Economic Survey 1997-98*: S-12.

the impact of the enforcement environment remains possible.

The policy implications of the findings of this paper are that sustainable reform in the financial sector and improvement in the performing efficiency of domestic banks require improvement in the enforcement environment in some regions of the country. The regional exposure effect would be more transparently evident were banks to report NPAs by state or region instead of merely as a national average as at present. The operating environment matters particularly in the Indian context where there are externally-imposed compulsions on banks to enter into and operate in difficult regions, and needs to be stressed against the background of recommendations on banking reform, such as those by Patel (1997), which tend to focus on the need for greater operational flexibility for banks. The environmental limits on bank operations cannot be tackled by reforms at bank-level alone.

Notes

[The authors are deeply grateful to Sandip Ghose and Ganti Subramanyam for generously making available the data used, and to Satish Kamath for assistance with computation.]

1 The average for Indian public sector banks as given in the *Report* in gross terms is as high as 19.5 per cent for 1994-95 and 13.7 per cent at end-March 1997 (see *Report of the Committee on Capital Account Convertibility*, Annexure III 7, p 160 and para 3.23). These are gross figures. The target is 5 per cent by 1999-2000. The corresponding net target is not prescribed.

2 "A 'non-performing asset' (NPA) has been defined as a credit facility in respect of which interest remained unpaid for a period of four quarters ending March 31, 1993, three quarters ending March 31, 1994 and two quarters ending March 31, 1995 and onwards" (*Report on Trend and Progress of Banking in India 1996-97* 121). NPA percentages are correspondingly obtained with respect to total bank credit.

3 Net NPAs are obtained from gross NPAs after deduction of the following:
(i) balance in interest suspense account, i e, interest due but not received,
(ii) claims received from credit guarantors and kept in suspense account pending adjustment (for final settlement),
(iii) part payment received and kept in suspense account, and
(iv) total provisions held. (*Report on Trend and Progress of Banking in India 1996-97*: 13)

4 Data on NPAs for the year 1997-98 are just out, but in the absence of other data required for the exercise performed in this paper, the 1996-97 figures were used.

5 Averages as given in *Report on Trend and Progress of Banking in India 1996-97*. The practice of providing an average figure of NPAs across all banks has been discontinued with the 1997-98 *Report* which reports averages only for public sector banks; not for other ownership categories.

6 The estimation procedure used is weighted least squares, the weights being the inverse of the number of banks in the country for a given year.

7 The growth rate of per capita real GDP is insignificant in both spread and profit regressions.

8 ROA : Return on Assets
OPR : Operating Profit Ratio

9 NIM : Net Interest Margin
OPSE : Operating Profit to Staff Expense
OCR : Operating Cost Ratio
SER : Staff Expense Ratio

10 Data on NPAs and all prudential and efficiency indicators from the *Report on Trend and Progress of Banking in India 1996-97*; on branches of banks as on March 31, 1996 from *Statistical Tables Relating to Banks in India 1995-96*.

11 Arab Bangladesh Bank; Bank Internasional Indonesia; Chinatrust Commercial Bank; Cho Hung Bank, Fuji Bank, Krung Thai Bank Public Company; Overseas Chinese Banking Corporation; Commercial Bank of Korea.

12 A capital adequacy ratio exceeding 100 per cent is possible, since the denominator includes only assets assigned a risk weightage greater than zero.

13 UCO Bank; Bareilly Corporation Bank; Benares State Bank, Catholic Syrian Bank, Lord Krishna Bank

14 There is a possible problem of simultaneity here. Banks with low NPAs could in principle find greater favour with investors and thus have a higher capital adequacy ratio. This possibility is least in India where not even all private banks are publicly traded, see SSB (1998)

Rural Bank Branches and Financial Reform

Renu Kohli

This note traces the bank branch licensing policy in India in the post-independence period, evaluates its performance and relates it to the present restructuring of the banking industry under financial reform. Within this context, the focus of the article is the future course of rural public sector banks. It offers the Indonesian transformation of Bank Rakyat Indonesia as a model relevant for the rural branches of public sector banks in India. It argues for their transformation as an alternative to closure or gradual substitution by private sector banks.

I
Introduction

THE purpose of this note is to propose a transformation of rural branches of public sector commercial banks as an alternative to closure or replacement by private sector banks in the second phase of financial reforms in India. The motivation for this exercise is the change in branch licensing policy stance under financial reform in the 1990s initiated under the World Bank-IMF structural adjustment and stabilisation programme. This policy change, a clear articulation of which is to be found in the Narasimham Committee Report (1998)[1] and the earlier Report of the Committee on the Financial System (1991),[2] stems from an explicit acknowledgement that quantitative expansion in the Indian banking industry has been at the expense of quality. Policy objectives for the public sector banks under financial reform have now been oriented towards efficiency and profitability and branch licensing of banks has consequently been deregulated by the central bank.

The underpinnings of the liberalised licensing policy lie in the proposed future structure of the Indian banking industry that is outlined in the two reports cited above. The NC (1998) emphasises institutional restructuring of public sector banks to enable their survival in a changing global environment. A three-tier structure is proposed in this report which roughly corresponds to international and universal banks, national banks and local, regional banks. There is some ambiguity about the role of existing rural financial institutions in the proposed banking structure. While the report has called for a review of proposals made by CFS (1991) on this issue and an establishment of a viable rural financial structure; it has also marked the third tier of local banks for financing local trade, small industry and agriculture in the same breath. Further, existing private banks with regional strongholds have been identified as critical institutions in this tier. It thus seems that new rural financial institutions are to be created as part of financial reform though it is unclear at this stage whether these will replace or co-exist along with old ones.

This note will suggest restructuring of rural branches of public sector commercial banks, arguing in favour of *transformation* of these institutions as an alternative to replacement or closure during financial reform. Successful experiments of transformation of stateowned banks in some developing countries provide evidence that financial reform need not necessarily involve privatisation or closure of existing institutions or replacement by new ones. In this paper, we draw extensively upon the Indonesian model of Bank Rakyat Indonesia which was transformed in the 1980s following liberalisation of the Indonesian economy. The note is organised into five sections. Section II provides an overview of branch licensing policy of the Indian banking industry in the pre-reform period, i e, up to 1990; Section III analyses the post-liberalisation branch licensing policy and the rationale behind the restructuring exercise; Section IV looks at the Indonesian experience, drawing parallels with the Indian financial sector and its relevance for rural Indian public sector banks, while Section V concludes with some observations and suggestions for adaptation of this idea in India.

II
Branch Licensing Policy in the Pre-Reform Period: An Overview

The banking structure inherited by the British in 1947 was characterised by numerous small-sized banks, and a few large institutions.[3] It was small in relation to India's population (87,000 per office in 1951) and GNP (commercial banks' assets to GNP ratio stood at 9.7 in 1951) and mainly confined to cities[4] and short-term commercial credit operations with minimal financing of agriculture.[5] The Banking Regulation Act (BRA), 1949, brought the financial system under the purview of the RBI and there was a process of merger and consolidation of commercial banks thereafter, resulting in a sharp reduction in the number of banks and a narrow institutional base.[6] This was considered necessary by the RBI to strengthen the banking structure.[7] This consolidation was further augmented by a restrictive branch licensing policy, motivated by the post-war and post-partition trends in the economy, and the Banking Companies (Restriction of Branches) Act, 1946.[8] From 1956 onwards, though the restrictive framework remained, the licensed banks were encouraged to expand liberally through opening of new branches. Thus elimination of the smaller banks and expansion of larger ones led to the establishment of an oligopolistic structure and a concentration in the banking system.

Following nationalisation of the banking industry in 1969, the central bank adopted an aggressive supply-led approach to financial development, an integral part of which was to locate branches in 'unbanked' (mainly rural and semi-urban' areas. There was a close correlation of this policy with the government's objective of resource mobilisation to finance the Five-Year plans. The branching pattern was broadly based on the government's scheme of development administration, so as to cover each of the community development blocks;[9] this was also considered necessary for implementation of government-sponsored rural development programmes. The spread of banking services in the post-1969 phase, especially the rural areas, has been phenomenal: the post-nationalisation pace of rural branch expansion is 20 per cent as compared to 1[illegible] per cent of the pre-nationalisation phase. Between 1969 and 1996, the number of bank offices in India has increased from 8,262 to 63,092. The distribution of bank branches has also undergone a structural change within this time span: the proportion of total bank branches in rural areas has gone up from 22.2 to 52.4 per cent 61 per cent of the new branches opened having been in rural areas.

It is evident from the branch licensing policy pursued in the post-nationalisation period that opening of bank branches in rural and semi-urban areas has been motivated by social benefit considerations. High fixed costs of establishing financia

intermediaries coupled with relatively low demand for banking services[10] in rural areas make it unprofitable for private agents to open branches in these areas. Social benefits from provision of banking services in such areas might outweigh private benefits though: financial intermediation provides consumers with a choice to borrow or lend some of their incomes; provides avenues for liquid financial assets as an alternative to holdings of real estate, gold, etc. offers a supply of loanable funds to consumers with investment opportunities and reduces transactions costs. It is to bridge this gap between social and private incentives that branch licensing of banks has been regulated in the period after nationalisation.

With financial reform however, policy objectives of public sector banks have been redefined. The earlier role of 'social banking' where banks were one of the instruments of the state in the development process, is now oriented towards profit-maximisation which has guided the evaluation of pre-reform branch licensing policy. The new structure proposed to complement the changed policy environment is discussed in the next section along with a brief evaluation of the performance of rural branches of public sector commercial banks.

III
Branch Licensing and Rural Branch Restructuring under Financial Reform

CFS (1991) has criticised the pre-reform branch licensing policy on several grounds. Thus, "While on the one hand the present policy has placed restrictions on commercial banks opening offices purely on profitability considerations, it has, on the other, directed banks to open offices in centres with the object of providing banking services especially in the rural and semi-urban areas regardless of the fact that such branches are likely to be unremunerative."[11] Again, "...this [branch] expansion was somewhat unplanned and haphazard with the result that considerable strains have been placed on their [banks'] organisational structure."[12] NC (1998) cites "...the large number of unremunerative branches..." and "...directed credit.." as "...proximate causes..." for the high level of non-performing assets (NPAs) and low profitability of the banking industry.[13]

Reappraisal of pre-reform branch licensing policy thus explicitly acknowledges that (a) quantitative expansion in banking has been at the expense of quality, and (b) rural branching has been inefficient and eroded the profitability of the banking system.[14] With a change in perspective, performance evaluation parameters have also changed. Earlier performance indicators like deposit, priority sector advances and branching targets have yielded to new ones indicating efficiency and profitability. The evaluation however, is subject to two caveats.

One, changing performance indicators from pre-reform to post-reform period ignores the social benefits of government intervention in financial markets. Public intervention to provide banking services in rural areas has not only prevented welfare losses arising from market failures of no financial intermediation[15] but also transferred surplus to consumers (borrowers and lenders) that would otherwise be captured by private producers[16] (e g, the informal financial intermediary). These gains can be quantified to some extent by available empirical evidence. Assuming that a rise in the savings rate is beneficial for the economy, a mobilisation of surplus incomes is a direct fall out of this intervention. The savings rate in India in fact, shows a strong, positive association with variables representing proximity or availability of bank branches.[17] This evidence is buttressed by the fact that rural branches have increased their share of deposits and credit between 1969 and 1996 from 3.0 and 0.2 per cent to 15.4 and 12.4 per cent respectively. The expanded network of bank branches has also facilitated mobility of surplus funds from rural to urban areas.[18] Government intervention in this sector has in fact, improved the allocation of capital through easing financial constraints and drawing newer borrowers into the formal credit market.

Second, there seems to be little published empirical evidence that rural bank branches are inherently non-viable or unprofitable. This is possibly because research on this topic is constrained by lack of suitably disaggregated data on banks' incomes and expenditures that could reveal association, if any, between bank loan categories, profitability and the population centre served by the branch.[19] Notwithstanding these limitations, there is some evidence to suggest that rural branches of commercial banks can be profitable. A study by an anonymous author [Analyst 1993] analyses data classified by population centres (i e, rural, semi-urban, urban and metropolitan) for a nationalised bank and finds that "...rural branches are the most profitable, whether profitability is worked out with reference to year-end working funds or average of two-year figures". The disaggregated components of profits analysed in this study showed rural branches had the highest interest rate on advances,[20] the highest interest margin,[21] and the second highest profit ratio.[22]

The study concludes that "...in terms of profitability, rural branches are not a liability to the bank..." and that "...inadequate management competence in individual banks is a major cause of non-viability of rural branches of many public sector banks." This is endorsed by CFS (1991) which states that "...the management of the rural branches has proved to be a daunting task in regard to manpower deployment. Internal controls over rural branches have become weak and ineffective. Information retrieval has been hampered by delays and inaccuracies and quality of assets severely affected by, amongst other things, absence of post-credit supervision."[23] NC (1998) also echoes this view, admitting that the average level of non-performing assets of the banks as a whole "...conceals wide individual variations and amongst the public sector banks, while some have gross NPAs of 7.4 per cent, there are others even now with NPAs of as much as 39.1 per cent..."[24] Prima facie therefore, it does not seem that all is lost with these rural branches as (a) there is some evidence to suggest that rural banking can be profitable, (b) non-viability bears some relation to incompetent management and supervision practices, as well as exogenous policy constraints such as subsidised and directed lending.

Both CFS (1991) and NC (1998) have suggested abandonment of the system of branch licensing as it "...was perhaps desirable and necessary for extending geographical spread in the formative years of expanding the financial infrastructure...[it now] needs to be reviewed...with the banking system now having extended its branch network over a vast area of the rural hinterland and successfully achieved an increase in banking density...branch licensing be abolished."[25] Having said that, it strikes a somewhat contradictory note when it goes on to say in the same breath that "..Indian commercial banks should be given full freedom to open or close branches (other than rural branches for the present) or swap their rural branches with those of other banks on the basis of their commercial judgment".[26]

The CFS model reiterated in NC (1998) with some modification, proposes a domestic banking sector on three-tier lines – the first tier would consist of two or three banks with an international orientation, a second tier of 8-10 large national banks to cater to the medium and large corporate sector, a third tier of a large number of local banks and a fourth tier of rural banks (including RRBs). The third tier of banks in the new model that is relevant for the purpose of this discussion is expected to "...be confined to smaller geographical

regions, namely states, or cluster of districts..."[27] and cater to the clentele of local trade, small industry and agriculture. Further, NC (1998) also calls for a review of CFS (1991) recommendations about reorganisation of commercial banks' rural branches[28] as the "...main issue is to evolve a system whereby rural financial institutions at the district and sub-district level can be constituted into a third tier of banking as indicated in the chapter on restructuring of banking institutions. Third-tier banks should be promoted and strengthened to be autonomous, vibrant, effective and competitive in their operations.[29]

Thus there is some ambiguity and confusion as to what reorganisation of rural branches of public sector commercial banks would mean. At the same time, affirmative roles for local, private banks and NGO financial institutions are well-defined. Thus "...the smaller older private banks operating in India have a useful role to play...[they] have developed a strong regional presence and have been able to meet the credit needs in their areas of operation. Their future set up needs to be considered taking into account their history and their local strength. They have a special role in local areas and could form part of the third tier of local/rural banks."[30] Again, "Banking policy should facilitate the evolution and growth of micro-credit institutions, including LABs (local area banks) which focus on agriculture, tiny and small-scale industries including such specialised institutions as may be promoted by NGOs for meeting the banking needs of the poor".[31]

Following this reassessment and suggestions, bank branch licensing policy was deregulated for the period 1990-95, though not completely abandoned. It now provides operational autonomy to banks to rationalise their branch network. Banks are free to shift their existing branches within the same locality, open certain type of specialised branches (specialising in agriculture and small-industry finance), convert existing non-viable rural branches into satellite offices, and close (with the approval of the Reserve Bank) one loss making rural branch at rural centres served by two commercial banks by mutual consent. Finally, banks fulfilling certain criteria are free to open their own branches.[32]

The banking structure emerging as a consequence indicates a shrinking public sector bank base through (a) horizontal integration and closure of branches of public sector commercial banks, (b) reduction/removal of barriers to entry for private sector (Indian and foreign) banks; and (c) affirmative policy environment in favour of private and NGO banks. To some extent, there is a reversal in the geographical expansion achieved after nationalisation, with substitution by the private sector, though not necessarily in the same areas. There also seems to be some apprehension about rural areas again becoming unbanked as the new private sector banks making an entry after 1994 are required to open 25 per cent of their total branches in rural/semi-urban areas.[33] Regulating the private sector to open rural branches indicates a supply-side approach, possibly motivated by the fear that private enterprise may not be forthcoming in these areas. To this extent, there is an element of continuity in the supply-led branching policy of the RBI, the only departure being a switch over to regulation of the private sector from the role of public provider of banking services.

Finally, the policy constraint of directed lending is to continue. Reviewing the recommendation in CFS (1991) of phasing it out, NC (1998) "...recognises that the small and marginal farmers and the tiny sector of industry and small businesses have problems with regard to obtaining credit and some earmarking may be necessary for this sector..." and recommends that "...the current practice may continue."[34]

Given the policy constraints of combining outreach to marginal borrowers and targeted lending along with institutional sustainability, it is a matter of some consideration whether these objectives can be realised by (a) phasing out old institutions, i e, closure of rural bank branches, (b) creating newer, private ones in addition to the existing ones, or (c) *within* the framework of existing institutions. Clearly, there is a need and demand for banking services in rural areas, and the choice to be exercised is between public or private provision. Given the historical legacy of the pre-reform branch licensing policy, i e, a widespread network of public sector commercial bank branches, it seems unreasonable to close down loss-making branches and implant new, private ones in their place, without even considering the alternative of restructuring *within* these institutions. Losses in these institutions are associated more with management and system specific factors than with location specific ones and it is not impossible to tackle them to restore the health of these institutions.

The real objective of financial reform therefore must be to devise a method that combines the objectives and wealth of the government with an incentive structure, legal enforcement powers and the information advantages of local networks of borrowers and lenders to build sustainable rural financial institutions. Theory suggests that by creating incentives, government institutions can relax financial constraints without experiencing the problems of non-performing assets and defaults. This idea has been employed with success in Indonesia, where a transformation of the loss-making stateowned banks into sustainable, profitable institutions has been achieved while retaining subsidised credit programmes. The Indonesian transformation under financial reform is discussed in the next section.

IV
Transformation of the Rural Branches of Public Sector Banks in Indonesia

Like India, the Indonesian financial system is also heavily dominated by the state, with the main commercial banks being owned by the central bank. This note, however, will concentrate upon only one institution, Bank Rakyat Indonesia (BRI), a nationalised bank operating at the national, district and sub-district (*unit desas*) levels. It is the most comparable to an Indian public sector commercial bank, in terms of structure, operational scale, location and size.[35] Prior to financial reform, the *unit desas* were primarily administering a subsidised agriculture credit scheme. They were required to provide subsidised credit (12 per cent) to most borrowers and pay an interest rate of 15 per cent: negative spreads thus kept them capital constrained and unprofitable. Like the rural branches of Indian public sector banks, BRI was generally unsuccessful in reaching its target population of small farmers and incurred substantial losses for both government and the bank.

Since 1983, BRI has come to be known internationally for its extensive, profitable and sustainable system of local banking that has a general scheme of credit running concurrently with subsidised lending. During financial reform in Indonesia, several liberalisation measures were undertaken that allowed BRI to transform itself into a profitable rural financial institution. Initial deregulation addressed some exogenous policy constraints. First, interest rates for both deposit and loan rates were freed that enabled the bank to set its own interest rates on most loans and deposits. Second, the stateowned banks were given time to adjust to the new environment and benefit from this deregulation for a period of five years, before further liberalisation increased competition by allowing entry of private sector banks. Third, deregulation introduced flexibility and autonomy that facilitated design of new products with extensive input from customers throughout the country. These instruments could meet local demand and provide institutional profitability.

Simultaneously, financial liberalisation also tackled endogenous constraints that affected BRI as an institution. These changes introduced staff incentives, accountability, autonomy, information technology, simplified procedures, thus transforming the original structure of BRI. First, its staff were trained to recognise and understand the local markets they served. This was augmented by mostly local hiring and deployment of staff to keep costs low and maximise on local knowledge and informational advantages. Second, internal practices were changed to treat each *unit desa* as a separate profit centre with its own balance sheet. Accountability was thus built in with each *unit desa* being held fully responsible for its financial health or otherwise. Supervision was regularised by visits of managers from BRI branches and head office. Third, managers and staff were authorised to take decisions on their own with only the largest loans to be referred to the BRI branch for approval.

Four, operations were systematically simplified to reduce administrative costs and housekeeping expenditures. Simple operations and specifically designed instruments restricted paperwork, interest calculations, records and book-keeping, etc. Five, computerisation introduced timely reporting, improved data management and provided early warning signals about defaults. Six, incentive schemes for both borrowers and staff were introduced. In addition, institutional reforms included appointment of an innovative president director and development of a new culture by focusing on professionalism, training, accountability, incentive, initiative, etc.

The key to BRI's success lies in its simple operations and well conceived incentive structure. It offers only one loan product, KUPEDES, a general credit scheme at commercial interest rates, and four savings products. It gives loans to individuals only at market interest rates, but less than those charged by informal financial intermediaries and uses a set of performance incentives backed by peer pressure as substitute for collateral. Socio-cultural factors such as persuasion through village heads and government are used to dissuade defaulters. Simple appraisal procedures consist of a half-page application form, countersignature by the village head and land certificates as collateral. The emphasis is on advance ensuring that the borrower has sufficient cash-flow to repay rather than on use of funds. Repayment terms are adapted to the regional context – thus repayment schedule may be weekly, monthly or seasonal. Further flexibility has been introduced by operating village posts and personal visits for repayment collection. The risks of the loan portfolio have been diversified by including financing of trade and services. This has also generated additional resources through current accounts maintained by traders and augmented traditional deposits.

Performance incentives for borrowers consist of a discount on interest payments which is refunded when all payments due have been made (0.5 per cent loan amount refunded) and credit limit is doubled for 100 per cent on-time repayment for previous loan. Staff incentives are linked to indicators as deposits mobilised, loan repayment rates and profits generated. As a result of this transformation, BRI's bad and doubtful debts are in the range of 2 per cent of their loan portfolio which is in sharp contrast to rural branches in India. Finally, it is important to note that creation of a conducive macroeconomic environment leading to investment of a substantial portion of the country's oil wealth in rural areas and resulting in rapid rural development, as well as a growing demand for banking services, contributed in no small measure to this success story [Robinson 1994].

The Indonesian example proves that it is possible to transform state-owned financial institutions to combine credible, locally administered incentive structures with government objectives and resources. It is a rare example of extremely successful lending to individuals in contrast to the group-lending combined with peer-monitoring concept exemplified by the Grameen bank experiment in Bangladesh which has been emulated with varying degrees of success in many developing countries, including India. The similarities between Indonesian and Indian public sector banks are not just structural but the problems and objectives are identical too. In the concluding section, we discuss how and in what areas can the Indonesian transformation be replicated and adapted to rural financial institutions in India.

V
Conclusion

The policy review attempted in Section III indicates that the trend of institutional restructuring in the rural banking sector so far indicates (a) regulated closure of loss-making rural branches or reduction through mutual consent, (b) important roles for old established private sector banks and entry of new ones, and (c) affirmative policy support for NGO financial institutions. While self-help groups and NGOs in micro-credit provision have been successful in many developing countries, and the entry of private sector institutions will undoubtedly introduce competition, it is questionable whether government policy objectives of equitable distribution of incomes and easing/relaxing financial constraints for marginal borrowers can be successfully realised through private agents. There are equally valid reasons for the government to supplement private credit facilities in rural areas as private intermediaries have different objectives and some of the benefits realised through interventionist policies are not internalised by these agents. There is a strong case therefore, for the continuation of state-owned banks in rural areas.

The discussion in this note shows that issues that need to be addressed in India during financial reform of rural branches are how to make them profitable, expand their outreach to meet the credit needs of small and marginal borrowers in rural areas and administer government objectives of targeting these borrowers through its policy of directed credit. This is partially echoed by NC (1998) which states that "...the issue of evolving a viable and efficient framework for rural credit has defied solution despite our long experience of the felt needs of rural credit and an examination of this issue by several committees and experimentation with various policies and institutions."[36]

The proposed solutions in NC (1998) for achieving financial viability emphasise flexibility, autonomy and accountability to restructure financial intermediaries at all levels. The details of these structural concepts however are discussed at a macro level, basically with reference to the first and second tier banks. For rural and small industrial credit, a special mention is made of directed lending, and the committee suggests that such loans should be made on "...commercial considerations...", that "...branch managers should be held fully responsible for these decisions..."[37] and "...credit delivery systems in respect of rural credit also need attention to make them more effective, speedy and transparent."[38] Second, it proposes that the interest rate subsidy for loans below Rs 2 lakh be removed.

What remains to be addressed however, is how to introduce these concepts at a micro level (i e, a rural bank branch) so as to bring about a structural change in the institution. It is here that the Indonesian transformation of its rural banking institutions can provide a good example. Like the Indonesian financial reform, some of the exogenous policy constraints that public sector banks in India operated under have been removed since 1990. Thus factors that affect profitability, i e, the interest spread have been left to market forces and banks are free to set their own interest rates. It must be noted though that the Indonesian deregulation allowed the public sector banks a period of five years

to benefit from interest rate deregulation, before increasing competition by allowing the private sector to operate. This has not been the case in India where competition through private sector entry has been imposed upon public sector banks simultaneously. Institutions need time to change and adapt to new environments and the NC (1998) recognises this when it states that "...it should be added that competition among the banks has itself not so far been a primary or even proximate objective of policy." This therefore is a sphere for concern and reconsideration.

Apart from deregulation of interest rates and removal of barriers to private sector entry, institutional reforms within the existing banking institutions still need to be initiated. These are critical to the turnabout of rural bank branches as the genesis of much of their problems lies in endogenous factors associated with management competence and systems, screening methods and adverse selection of borrowers, lending decisions, monitoring and supervision of loans, weak or non-existent information systems, etc (cf Section III of this paper). Note, for example, this comment by NC (1998) "...the banking system should be in a position to equip itself to identify the eligible clients based on prescribed norms in the government sponsored programmes so that the full responsibility for all aspects of credit decisions lie with it. Credit delivery systems in respect of rural credit also need attention to make them more efficient, speedy and effective."[19]

These factors uniformly afflict all the branches though the extent may vary. Institutional restructuring norms however, cannot be evolved and applied uniformly as a solution to common problems faced by these banks. It must be realised that not all, but only some, changes can be introduced universally in these institutions. Thus reforms in internal practices such as treating each branch as a separate unit for balance-sheet accounting and profitability, incentives payments to staff to improve loan recoveries, information systems, record-keeping and reporting systems, simplified loan procedures can be commonly evolved. Second, considering that majority of the rural branches' assets portfolio is skewed towards agricultural lending that makes it inherently risky, there is no harm in uniformly allowing rural branches to finance trade and services as a matter of policy. In Indonesia, this not only diversified the risk of the BRI but also helped in boosting resources.

But areas like product flexibility, use of local information systems and socio-cultural practices to evolve unique methods and solutions for optimal screening, monitoring, supervision and enforcement of credit contracts, as well as introduction of incentives require considerable institutional autonomy and decentralisation. These reforms have to be bank- and branch-specific – the management of each public sector bank ought to be given the freedom, and in turn, give the freedom to its subordinates at the rural branch level to propose and implement solutions for local customisation and adaptation of their operations. This is no simple task as each unit would have to study the area and the people it serves: their needs and preferences for savings, loans and repayments; devise incentives best suited to their clientele to minimise the incidence of default; employ local customs, mores and sanctions towards the common objective of maximising loan recoveries, etc. In summary, the orientation of each rural branch has to be that of the local moneylender whose strength lies in his intimate knowledge of the borrower and devising a set of mutually compatible incentives to reduce default (e g, inter linking credit contracts with labour or commodity contracts).

Institutional transformation therefore must begin with recognition of the fact that many of the public sector banks that have evolved presently into 'national' banks have originated in specific regions and to this day retain that identity through staff composition and location of head office and majority of their branches. For example, banks like Syndicate and Canara bank which originated in the south, still dominate those regions and would expectedly be more well informed about those regions than, for e g, State Bank of Bikaner and Jaipur, whose informational advantage obviously lies in Rajasthan.. These factors can be used to combine local knowledge along with cost reduction associated with local hiring and deployment of staff. Second, comparative information advantages would facilitate recognition of specific regional credit and deposit needs that undoubtedly vary across the country due to different business practices, investment opportunities, etc. The Indonesian transformation shows that designing savings and loans products that were well suited to the local conditions was an important factor in expanding credit access and deposit mobilisation by the rural banks.

Three, this factor would help tremendously in using socio-cultural factors for moral persuasion in debt repayment and providing early warning signals for debts turning bad. Social and cultural practices as well as the level of politicisation vary vastly in a diverse polity like India and the futility of adopting a uniform practice in this sphere is self-evident. Knowledge of local language, groups, and practices would facilitate screening of borrowers and avoid adverse selection of borrowers in the pre-loan stage. These institutional changes will obviously involve a substantial measure of decentralisation and autonomy in decision-making. This can be successfully married to the concept of accountability by making each branch separately accountable for its performance.

Finally, performance incentives for both staff as well as borrowers need to be introduced. Incentives, however, need to be devised with considerable care and caution such that participants benefit from monitoring. It is clear that there can be no wholesale prescription in this sphere and each branch would have to evolve its own, particularly with reference to borrowers. Theory tells us that much of the borrower-lender relationship is to do with 'hidden information' and 'hidden action' and the solution lies in devising suitable incentives to overcome these problems. Recognition of this principle has been successfully translated into practice by financial intermediaries in many developing countries but is yet to germinate in the Indian banking sector. Banks here have yet to adopt practices that give incentives to borrowers to repay rather than default; they have also yet to incorporate performance evaluation of staff linked to indicators like mobilisation of deposits, profits for their branch, loan recovery rates, etc. A clear, analytical understanding and application of this concept in Indian banking can actually go a long way in resolving one of the most pressing problems of rural branches, i e, systemic default.

The Indonesian experience shows us that incentives formed part of a mutually reinforcing set of design features, all directed at the common objective of screening out good borrowers from bad borrowers at minimum cost [Mosley 1995]. One of the key features, i e, market interest rates, have already been introduced in India and obviously apply universally. Expectedly, this would not only discourage unsound projects and attract genuine borrowers but also provide cross-subsidisation for government sponsored programmes that are to continue. Likewise, the need for simplified loan appraisal procedures has been recognised and solutions proposed in the recently submitted Gupta Committee Report on Agricultural Credit. But some features of the Indonesian incentive structure such as very short repayment intervals for loan instalments, facilities for repayment at or near the borrower's premises to reduce the borrower's transactions costs and provide the lender with early warning of potential problems in repayment would require customisation to suit local conditions and preferences.

Designing and establishing incentives at the level of each branch would require knowledge and understanding of concepts and objectives by both managers and staff. Obviously a key requirement here is training to adapt and reorient personnel to enable them to undertake this task. This is an area critical to institutional transformation since many of the problems are associated with managerial incompetence.

The structural similarities between the Indonesian and Indian financial systems and the commonalty between financial reform objectives indicate that there is much to be learned from the transformation of the Indonesian rural financial institutions. The latter country's experience shows that reforming rural financial institutions need not necessarily entail privatisation or closure; existing institutions can be reformed without incurring painful human costs associated with institutional closure.

Notes

2 Chairman, M Narasimham. Hereafter referred in the text as CFS (1991)
3 For a detailed historical account, see Goldsmith (1983)
4 In 1946 the three largest cities and leading financial centres viz, Bombay, Calcutta and Madras together had one-eighth of all bank offices, many of the smaller cities and practically all villages were without a commercial bank office [cf Goldsmith 1983]
5 Thus 2 1 per cent of advances of scheduled commercial banks were made to agriculture in 1951 with industry and commerce aggregating 33 5 and 53 1 per cent respectively (*Source* Report on Trends and Progress in Banking in India RBI; *Annual Report*, RBI, various issues)
6 The number of functioning Indian banks came down from 328 in 1960 to 94 at the end of 1965 (*Source RBI Bulletin*, October 1966) The group of smaller (non-scheduled) banks almost disappeared as a result of mergers with the larger banks as from the point of view of financial strength, it were the smaller banks that did not meet the newly laid minimum efficiency criteria Ghosh (1979) has pointed out that coverage of services offered by commercial banks also declined consequently, as the smaller banks accounted for the bulk of borrower accounts, i e, personal accounts, commerce and agriculture, decline in the number of which was specially marked
7 *RBI Bulletin* (October 1966 pp 1151-57)
8 Ghosh (1979:50)
9 *RBI Bulletin* (Supplement, July 1979)
10 This follows from low incomes and therefore a low marginal propensity to save (Pandit 1991 finds empirical support for this hypothesis for Indian data) On the borrowings side there is a preponderance of agricultural borrowers that makes the banks' assets portfolio too risky given the covariant risks attached to agricultural loans
11 CFS (1991 74 75)
12 Ibid, p 71
13 NC (1998 2 3)
14 CFS (1991:34) states that "...perhaps the single most important cause for the...increase in expenditure has been the impact of the phenomenal expansion in banking." NC (1998) also reiterates this opinion
15 In the absence of any intermediation, lenders and borrowers would have to seek each other out individually, incurring substantial search costs and risk premium. This would have the effect of driving a big wedge in borrowing and lending rates, resulting in loss of consumers' surplus in the form of consumers failing to receive the market-clearing interest rate on their loans and deposits and an additional welfare loss of some consumers disappearing from the market altogether.
16 This is the producers' surplus enjoyed by the private agent, i e, the difference between the price he receives and the marginal cost of producing that unit The larger this wedge, higher would be his profits
17 The impact of the banking sector on savings behaviour in the Indian economy has been demonstrated by most econometric studies on the subject Fry (1988) estimates that over the period 1961-81, increased bank branch proximity exerted a substantial influence on the national saving rate in India, by as much as 4 7 percentage points Krishnaswamy et al (1987) found that increased banking facilities, measured by population per unit bank branch, had a significant and considerable impact on the savings rate Pandit (1991) too found the spread effect of bank branch expansion to be positive and significant in explaining the savings rate Finally, Chakravarty [RBI 1985] has pointed out the important role of banking infrastructure in acceleration of the savings rate from seventies onwards.
18 Thiagarajan (1975 1820-21) has pointed out that more than half of the financial surplus mobilised in rural areas is loaned in different urban markets in India as a result of the branching policy
19 The primary source of banks' balance-sheet information is the *Statistical Tables Relating to Banks in India* published by the RBI These tables however do not classify balance-sheets by branch categories to enable a detailed study on the subject
20 12 77 per cent, followed by metro (12 35), urban (11 90) and semi-urban (11 74) per cent respectively
21 4 40 per cent followed by metro (3 41), urban (3 30) and semi-urban (3 17) per cent respectively.
22 2 56 per cent Metro branches had the highest profit ratio at 2 82 per cent, the bank's overall average was 2 52 per cent

28 The CFS model had conceived a rural banking structure as a fourth tier "...which could combine effectively the advantages of the local character of the RRBs and the financial strength and organisational and managerial skills of the commercial banks. ..it would be advantageous for the sponsor banks to segregate the operations of their rural branches through the formation of one or more subsidiaries, depending on the size, administrative convenience and business assessment of each sponsor bank. Each subsidiary should have a compact area of operations. This would be particularly desirable from the point of view of recruitment and deployment of manpower apart from providing the needed thrust to business operations and effective improvements in the control, supervision an information systems" [CFS 1991:76-77].

Rural Credit Delivery: Performance and Challenges before Banks

V Puhazhendhi
B Jayaraman

Development of the rural credit delivery system in the country has metamorphosed from monopoly of co-operatives to the induction of commercial banks and establishment of regional rural banks for improving the outreach and ensuring access to credit in rural areas. With the implementation of financial sector reforms, the accent is on ensuring the financial health of the system. Innovations in rural credit delivery had an impact on agricultural production and reduction of poverty due to increased flow of credit. Accelerating the pace of capital formation in agriculture, infrastructure development with focus on transportation and marketing, ensuring credit discipline will enable the rural sector to absorb more credit from institutional sources. The focus should be on strategies that are required for tackling issues such as sustainability and viability, operational efficiency, recovery performance, small farmer coverage and balanced sectoral development.

ENSURING access to credit in the rural areas for augmenting agricultural production, alleviating poverty and improving the efficiency of the rural credit delivery system has been an area of focus in the planning process in our country. Various measures initiated to improve the outreach of credit institutions, besides enhancing capital formation and production in agriculture, have been instrumental in alleviating poverty in the country. The changing economic scenario coupled with emerging segmentation of the rural credit markets pose new challenges to the rural credit delivery system. Financial sector reforms which seek to minimise governmental controls on credit institutions, impose stringent accounting norms and give freedom to banks from mandatory rural lending may create conditions not auguring well for rural development, especially for the vulnerable sections. Nevertheless, credit will continue to play a crucial role in securing the objectives of high growth rate, doubling of foodgrains production in the next decade, eradication of poverty and unemployment, especially of women, development of rain fed areas on a watershed basis, etc, as enunciated in the National Agenda for Governance and in the draft Ninth Five-Year Plan document [GOI 1998]. This paper reviews the performance of the rural credit delivery system in three focus areas of the rural credit markets, viz, agricultural, non-farm sector activities and poverty alleviation and the challenges that the banks are likely to encounter in the next decade. The paper also suggests strategies for overcoming these challenges.

I
Performance of Rural Credit Structure

The development of the rural credit delivery system had three distinct phases. The first phase (1904-1969) was characterised by the monopoly of the co-operative credit institutions while the second phase (1969-1991) witnessed an expansion of the network of credit institutions in order to improve the access of the rural population to institutional credit and other banking facilities even in the remotest parts of the country. This phase was marked by the induction of the commercial banks into the rural credit delivery system through their nationalisation in 1969 and the setting up of the Regional Rural Banks (RRB) all over the country, beginning in 1975, to provide low cost banking facilities to the weaker sections of the society. The number of branches of commercial banks which was 5,175 in 1969 increased manifold to 46,964 in 1997 while the RRB branches were 14,463 (1997). Simultaneous with the expansion of branch network, several measures were also initiated with a view to streamlining the delivery of rural credit. Such measures included (a) Lead Bank Scheme and preparation of District Level Credit Plans (DCPs), (b) Village Adoption Scheme, (c) opening of specialised branches for agricultural lending, (d) service area approach, etc. The third phase (1991 onwards), coinciding with the introduction of the financial sector reforms, is an attempt to transform the credit institutions into organisationally strong, financially viable and operationally efficient units. Viewed from a different perspective, the period between 1969 and 1982 saw the rural credit institutions focusing on augmenting and stabilising agricultural production while the period from 1982 focused on reducing poverty (through IRDP and other programmes) and creating employment opportunities with emphasis on financing non-farm sector activities.

The outreach of credit for agriculture has expanded significantly over time. The total short-term credit flow (in nominal terms) had increased from about Rs 589 crore in 1970-71 to Rs 17,691 crore in 1996-97 (provisional) while the term credit given for financing investment activities by the farmers increased from Rs 229 crore in 1970-71 to Rs 10,962 crore in 1996-97 (provisional). The growth in short-term credit to agriculture was 11.8 per cent during the period 1970-71 to 1981-82 but decelerated to 10 per cent during the period 1982-83 to 1991-92.[1] Term credit flow showed relatively better growth rate of 17.9 and 11.3 per cent, respectively, during the corresponding periods. (Table 1) Growth rates (nominal and real) both for short-term and term loans were higher during the third period indicating that financial sector reforms did have a positive impact on the flow of credit.

The higher growth in the first sub-period can largely be attributed to the induction of commercial banks and RRBs in a big way in the rural credit market and launching of Lead Bank scheme in the mid-1970s coupled with formulation of DCPs. This was also the period when the emphasis was on expanding the network of branches and widening of credit. The growth in agricultural loans had slowed down, except for short term, in real terms during the

subsequent two sub-periods but had accelerated during the third sub-period. While the improvement in the growth rates of credit augurs well for the rural sector, an area of concern is the declining trend shown by the priority sector lending, especially for agriculture loans by the commercial banks. Against a targeted 18 per cent, the proportion of advances to agricultural sector under priority sector lending declined from 16.9 per cent in June 1990 to 14.3 per cent in March 1996, despite including indirect advances for agriculture under priority sector lending from 1993-94 onwards. Indirect advances as a proportion of net bank credit constituted 1.3 per cent in June 1990. Thus, the decline in priority sector lending during the period 1990-91 to 1995-96 was 2.6 percentage points. However, a reversal of the reducing trend has been observed in 1996-97 (March) when loans issued for agriculture constituted 16.3 per cent of the net bank credit (Table 2). A similar trend could also be observed in the case of the priority sector lending whose share had declined from a peak of 42.9 per cent in December 1985 to 36.6 per cent in March 1995 but marginally improved to 41.7 per cent in March 1997

II
Impact of Credit on Agricultural Development

Foodgrain production accounts for about 63 per cent of agriculture output and hence its performance, to a greater extent influences the level of agricultural production in the country. The annual growth rate of foodgrains during the last three decades worked out to 2.67 per cent [GOI 1997]. Optimum use of material inputs, especially irrigation and fertilisers is a necessary condition for improving the production and productivity of crops. The share of area irrigated by wells (tubewells and other wells) in the net irrigated area increased from 38.1 per cent in 1970-71 to 52.9 per cent in 1992-93, mainly due to bank credit. By the end of the Eighth Plan, about 62 lakh hectares of potential was created under minor irrigation and the utilisation was 58 lakh hectares. Similarly, the increase in consumption of chemical fertiliser during recent times has been phenomenal and institutional credit has played a significant role in the increased use of material inputs. While the consumption of fertiliser per hectare of gross cropped area increased by only 18.34 kgs (from 13.61 kgs to 31.95 kgs) during the period 1970-71 to 1980-81, it increased by as much as 35.54 kgs during the following decade to 67.49 kgs in 1990-91 and further to 74.80 kgs in 1995-96. The production performance of agriculture as gross value of output (in real terms) had registered a marginal improvement in growth from 1.1 per cent during the first sub-period to 1.2 per cent in the second sub-period while the value of inputs used during the corresponding period had registered a growth of 2.5 and 2.6 per cent, respectively. The growth in short-term credit was 4.5 and 4.9 per cent during the two sub-periods.

Credit acts as a facilitator and it performs the important function of providing the farmers with the requisite control over resources affecting production. It is difficult to establish a direct relationship between credit and output as the former facilitates the adoption of technology and the level of inputs usage which in turn directly influence the production performance.[2] The impact of credit on inputs usage and inputs on output, estimated through a regression analysis, is presented in Table 3. The results of the regression indicate that there was significant and positive impact of credit on the level of inputs used, which in turn had a significant and positive impact on the gross value of output in agriculture

The increased flow of term credit has significantly contributed to the growth of capital formation in the private sector in agriculture. The estimated private sector capital formation (at 1980-81 prices) in agriculture and allied sectors had increased from Rs 2,051 crore in 1970-71 to Rs 6,193 crore in 1995-96. The growth rate of capital formation both in the private and public sector had decelerated during the second sub-period but had accelerated during the third sub-period (Table 4).

Different factors such as improved terms of trade in favour of agriculture especially during late 1980s and later growth in institutional credit for investment purposes, growth in income (GDP), may also have contributed to growth in private capital formation. The share of term credit in private capital formation, which during the first sub-period was about 33 per cent, increased to 51 per cent during the second sub-period. However, it declined to 26 per cent during the third sub-period. On the one hand, despite the increase in the relative share of credit to capital formation in the private sector during the second sub-period, the growth had decelerated in the private sector while on the other, during the third sub-period although the relative share of credit had declined, growth in capital formation in the private sector had accelerated. This raises the widely debated issue of complementarity between the capital formation in the private and public sectors [Mishra and Chand 1995; Rao 1994, 1998 and Shetty 1990].

The promotion of the rural non-farm sector (RNFS) through credit has come to be increasingly recognised as an alternative to providing employment and income generation, due to the failure of the agriculture sector to absorb the burgeoning labour force in the rural areas. The analysis of the data on credit limit to the RNFS[3] by the commercial banks showed that credit

TABLE 1. TREND GROWTH RATES OF FLOW OF SHORT-TERM AND TERM LOANS

(Per cent per annum)

Period	Short-term Credit		Term Credit	
	Nominal	Real	Nominal	Real
1970-71 to 1996-97	12.3	5.9	14.1	5.3
1970-71 to 1981-82	11.8	4.5	17.9	9.2
1982-83 to 1991-92	10.0	4.9	11.3	2.3
1991-92 to 1996-97	20.6	14.9	17.5	12.5

TABLE 2 SHARE OF PRIORITY SECTORS IN BANK CREDIT

(Per cent)

Year	Agriculture		Small Scale Industries	Other Priority Sectors	Total Priority Sector
	Direct	Indirect			
June 1969	1.3	4.0	8.6	0.7	14.6 (441)
December 1976	7.6	2.5	13.0	2.6	25.7 (3,395)
December 1980	12.3	3.3	16.5	3.8	35.9 (7,888)
December 1985	15.4	2.9	19.5	5.0	42.9 (20,648)
June 1990	16.9	1.3	15.6	9.0	42.3 (38,649)
June 1991	15.0	1.0	15.8	8.2	40.0 (42,093)
December 1992	14.4	1.3	14.9	7.3	37.9 (46,596)
December 1993	13.8	1.2	14.6	6.8	36.4 (49,822)
December 1994	13.0	1.5	14.4	8.7	37.4 (57,349)
March 1995	12.3	1.6	14.3	7.4	36.6 (61,794)
March 1996	12.4	1.9	16.0	7.5	37.8 (69,609)
March 1997 (P)	13.6	2.7	16.6	8.7	41.7 (79,131)

Note Figures in parentheses indicate amount (Rs crore) of credit for priority sector

flows increased from a level of Rs 1,251 crore at end-June 1973 to Rs 26,783 crore by end-March 1995 while the number of accounts increased from 2.3 lakh to 43.6 lakh. Despite this phenomenal growth in absolute terms, the proportion of number of accounts, credit limits sanctioned and amount outstanding as per cent to the bank credit did not show any remarkable change. The growth rates computed for the two periods indicated that like in the case of agricultural loans, there was a deceleration from 14.3 per cent (1973 to 1982) to 12.6 per cent (1983 to 1995).

Credit extended to rural industries as a percentage of total credit amounted to 20.3 per cent (as of March 1991) despite the fact that the rural industrial sector accounted for over one half of the total industrial units in the country [NABARD 1994]. One of the policy options in such a situation was to increase the availability of credit through the mechanism of refinance. The advent of NABARD[4] increased the availability of refinance from Rs 1.25 crore during 1985-86 to Rs 617 crore during 1997-98 while the cumulative refinance had gone upto Rs 3,013 crore for the RNFS (excluding the ISB component under IRDP). The growing importance of the RNFS in the loan portfolio of NABARD could be judged from the fact that the relative share of this sector to the total refinance disbursed for investment credit increased from 3 per cent in 1987-88 to nearly 16 per cent in 1997-98. This growth could largely be attributed to the promotional efforts of NABARD. The promotion of the RNFS financing by NABARD also facilitated the co-operative banks and the RRBs to make available credit for this sector. The co-operative banks (SCBs and SLDBs) and the RRBs together accounted for a major chunk (79.3 per cent) of the cumulative refinance disbursed by NABARD till March 1998. The trend growth rate in the disbursement of refinance to the RNFS by NABARD was 35.1 per cent during the period 1987-88 to 1997-98. The disbursement of refinance by NABARD to the RNFS commenced from the year 1985-86 but because of the low base in the initial years, growth rates were computed for the period 1987-88 to 1997-98.

Poverty reduction through gainful employment or by way of asset creation supported by credit for raising the income levels of the poor is the cornerstone of the IRD Programme, implemented throughout the country from 1982. Under the programme, 52 million families have been benefited (till March 1998) and total credit mobilised from banks was to the tune of Rs 20,324 crore. The assistance from the banks and the subsidy by the government had resulted in investment of Rs 32,824 crore at the ground level (Table 5). Commercial banks and RRBs together accounted for a major share (nearly 85 per cent) of the credit disbursed under IRDP while the share of co-operative banks was a meagre 15 per cent (Table 6).

The results of the last Concurrent Evaluation revealed that 14.8 per cent of the old beneficiaries assisted under the programme could cross the revised poverty line of Rs 11,000 (at 1991-92 prices) while 50.4 per cent of the families were able to cross the earlier poverty line of Rs 6,400. The IRDP assets had generated an incremental income of more than Rs 2,000 for 56.6 per cent of the assisted families at the national level. In about 29.3 per cent of the cases, the assets had not generated any income [GOI 1996]. Despite criticisms and difference of opinion on efficiency in its implementation, there are no two opinions on the programme's success, albeit limited, in reducing poverty in India.[5]

A series of evaluation studies conducted by various agencies on IRDP documented several weaknesses in its implementation such as (i) poor quality of assets procured by the beneficiaries, (ii) inadequate financial assistance including subsidy, (iii) lack of inter-agency co-ordination in ensuring backward and forward linkages, (iv) concentration on a few activities, (v) misutilisation of loans for meeting the consumption requirements, and (vi) inappropriate identification of beneficiaries and activities. The study also revealed that only 3.9 per cent of the IRDP beneficiaries received training under TRYSEM and as much as 47.2 per cent of the TRYSEM trained beneficiaries could not graduate for undertaking economic activities [GOI 1996].

The recovery performance under IRDP was relatively poor (41 per cent as at end March 1996) compared to the overall recovery performance of the banks. Wilful default by beneficiaries (43.6 per cent of the sample beneficiaries) expecting loan waiver by the government was a major factor contributing to the poor recovery under IRDP. The other factors included lack of co-ordination among different implementing authorities, wrong identification of beneficiaries and activities, inadequate follow up, misutilisation of loan, etc. The programme also had a debilitating effect on the health of the financial institutions due to increasing proportion of non-performing assets to the loan portfolio as a result of defaults in loan repayments by borrowers, directives of the government to the banks to lend at concessional rates of interest leading to insufficient margins, fixing of targets, lack of freedom in the choice of clientele, etc.

Despite the massive subsidy-credit linked programme under IRDP, poverty levels in India continue to be high [UNDP 1997] and many people still do not have access to formal credit institutions. It is this inability of credit institutions to cover a sizeable segment of the rural poor due to high cost of administering such large numbers of small loans as also their perceived lending risks (in the absence of any collateral), which has prompted a number of non-governmental organisations (NGOs) to enter the rural credit scene by way of organising the poor into informal groups for mutual help and benefit. Many of these groups have provided credit support through their credit institutions.

Table 3: Regression Analysis Results

Dependent Variable	Independent Variable	Constant	Coefficient	Standard Error	R^2	Number of Observations
1970-71 to 1995-96						
Gross value of output	Gross value of inputs	2.67	0.52	0.03	95	26

Table 4: Trend Growth Rates of Capital Formation in Agriculture

(Per cent per annum)

Capital Formation in	1970-71 to 1995-96	1970-71 to 1981-82	1982-83 to 1991-92	1991-92 to 1995-96
Public sector	1.0	8.3	(-) 5.3	6.0
Private sector	3.1	4.5	3.8	8.7

With a view to evolving supplementary credit strategies for reaching the unreached rural poor in a cost-effective way, NABARD had in 1992-93 introduced the pilot project for linking self-help groups (SHGs) with banks. The project has shown remarkable progress over the years. Starting from a modest number of 225 groups linked in the year 1992-93, the number of groups linked with banks, as on March 31, 1998, stood at 14,283 (76 per cent are women groups). Thirty commercial banks, 94 RRBs and 16 co-operative banks participated in the project and disbursed Rs 24 crore as bank loan till March 1998. The Small Industries Development Bank of India (SIDBI) also launched in 1994 a scheme for micro-credit under which financial support to well managed NGOs for on-lending to rural poor with emphasis on women for setting up micro-enterprises is envisaged. Cumulative assistance under the scheme was Rs 8 crore to 72 NGOs with a membership of 48,000 poor.

III
Future Expectations from Banks

The demand for credit in agriculture is showing increasing trend due to commercialisation and diversification that has taken place in the sector over time. The credit needs of the non-farm sector that holds promise for the future also have to be taken care of. Taking cognisance of the future potential and demand, the Working Group on Agricultural Credit has estimated that a total of Rs 2,29,750 crore of credit (Table 7) may be required by the agricultural sector during the Plan based on 4.5 per cent growth in the sector during the Ninth Plan period [GOI 1996]. This would mean that an annual growth rate of 16 per cent in the credit flow has to be maintained during the Ninth Plan period and beyond. To achieve the projected demand of credit for agriculture, the additional flow over the end period of Eighth Plan would increase from Rs 9,658 crore in the first year to Rs 15,607 crore in the terminal year of Ninth Plan. The estimates of supply of credit, based on the deposits of banks, is of the order of Rs 72,316 crore during the first year of the Plan, i e, 1997-98 and Rs 1,40,722 crore during the terminal year of the plan, i e, 2001-2002. The estimates of the resource gap,[6] as per the working group, will be of the order of Rs 9,658 crore during the first year of the Plan and will reach a level of Rs 15,607 crore during the terminal year.

With the recent programme of doubling the food production in ten years (by the year 2008), the envisaged growth rate in agriculture would be 6.11 per cent. This would translate into a higher credit need for agriculture production and investment activities. Accordingly, the estimated credit demand for agricultural development can be placed at Rs 46,000 crore in 1997-98 and Rs 54,300 crore in 2002-03. The estimated credit flow in the terminal year of Eighth Plan (1996-97) was of the order of Rs 26,000 crore. Hence, the additional resource gap will be Rs 20,000 crore in 1997-98 and Rs 28,300 crore in 2002-03.

The credit needs of the rural non-farm sector which holds promise for weaning away the excess working population in the agriculture sector also have to be satisfied. The additional investment required, for achieving 8.1 per cent growth rate of employment in the RNFS by 2001, is estimated to be around Rs 31,800 crore. It is further estimated that the formal institutional credit support may form about 60 per cent of the total credit requirement, i e, Rs 19,200 crore and the rest may have to be met by the informal sector [Kotaiah 1998]. Further, the credit requirements of the members of two lakh SHGs which are proposed to be linked to the credit institutions in the next five years will have to be met.

Viewed against the past performance of the banks in the dispensation of credit during the plan periods, the challenges to the rural credit institutions are enormous. The performance (achievements against targets) of all banks, including co-operatives, declined from 89.3 per cent during the Seventh Plan period to 86.9 per cent during the Eighth Plan period. The shortfall in respect of investment credit was found to be more in the Eighth Plan period.

The future strategies, in a scenario of wide gap between demand and supply of agricultural credit, must focus mainly on resource mobilisation to meet the growing demand of credit. The implementation of the financial sector reforms since 1991-92

also appears to have had an impact on the flow of credit to the various sectors of the rural economy. The prudential norms of accounting like capital adequacy, income recognition, provisioning and the possibilities of reduction in the share of 'directed credit' as a part of the financial sector reforms are likely to have far-reaching implications for micro-credit and credit institutions. Data on recent disbursements to the priority sectors by commercial banks show a declining trend indicating that these banks are likely to shy away from lending to sectors which are perceived by them as high risk borrowal accounts due to high transaction costs and delinquency in repayment of loans. A lesson learnt from the Indian experience is that commercial banks are not likely to expand their lending portfolio on their own unless directed to do so.

IV
Issues and Strategies

Financial intermediation has become complex covering a broad spectrum of activities ranging from micro-credit at lower end to corporate/market instruments at the higher end. The complexities of financial intermediation necessitate specialisation both in terms of organisational reorientation and upgrading the skills of its personnel to deal effectively and efficiently with such activities. The financial sector reforms being implemented in the country, coupled with the specialisation required in financial intermediation, raise many important issues that need to be taken cognisance of to ensure a sustainable and effective rural credit delivery system. Some of the major issues are as follows.

Sustainability and Viability

Sustainability implies that a credit programme is to be so directed as to continuously increase the capital base of intermediaries to sustain further expansion of their lending business on a long-term basis. In order to be sustainable, the credit institutions are required to have sufficient margin between lending rates and the cost of funds raised for lending, to cover non-financial transaction costs. Despite the impressive gains made by the rural credit delivery system in terms of resources mobilisation, geographical coverage and functional reach in last two decades, there has been a deterioration in the financial health of the credit institutions. The emphasis on quantitative targets has resulted in poor quality of lending, which in turn adversely affected the viability of the structure itself. Implementation of government sponsored credit linked poverty alleviation programmes with high transaction cost and default rate, and undertaking public distribution system (PDS) by co-operatives, affected the viability of rural lending [Puhazhendhi 1996]. The ACRC recommended that the minimum lending rate to be charged by CBs, RRBs, SCARDBs and PACS was to be 14.5 per cent, 16.4 per cent, 12.8 per cent and 15.9 per cent, respectively, at the then prevailing costs and business levels (1986-87) [RBI 1989]. A limited analysis of the operating and net margins of the SCBs indicated that during 1996-97, as many as 21 of the 28 SCBs had operating margins of less than 2 per cent while the net margins was less than 1 per cent. Most of the SCBs in the north-eastern region had negative net margins ranging from 5 to 13 per cent [NABARD 1998b]. The application of prudential norms to the co-operatives from 1997-98 is likely to further reduce the margins. The average net margin in the case of RRBs deteriorated from (–) 2.54 per cent to (–) 3.72 per cent.

The two options available to the credit agencies to become viable are (i) increasing the volume of business with the existing interest rate structure and (ii) charging break-even level of interest at the existing level of business. This brings us to the next question: What interest rates should the institutions charge on their loans? Often it is argued that adequacy and timely availability of credit is more important rather than its price and, therefore, a hike in interest rates is indeed justifiable. In the Indian context, however, where the interest rates were deliberately kept low (till 1991-92) under the administered regime to promote agricultural development the outcome of a sudden hike in interest rates, especially its impact on the demand for credit is not known in the absence of specific studies. Despite total deregulation of interest rates, co-operatives and RRBs are not in a position to charge these rates because of the compulsions of the prevalent financial market. The commercial banks, being the market leaders, could set the interest rates which the other credit institutions may follow. Viewed against the inflation rates in the recent years, existing interest rates appear to be high and, therefore, increasing the interest rates may not be feasible. Further, the traditional farming nature with high degree of risk realises low rate of return and hence increasing the rate of interest may tend to be counter-productive. A hike in interest rates has to be in tune with what the rural credit market is able to bear given the returns from investments in agriculture and other rural activities. In any case, interest rates based on high costs of providing services due to inefficiency cannot be justified. Thus, the only option available is increasing the operational efficiency of the credit institutions through increasing the volume of business and cutting the transaction and risk costs. There is scope for increasing the volume of business without adding to the costs of the credit institutions as there are economies of scale [Desai 1996].

Operational Efficiency

Mere raising of interest rates is not the only way of achieving sustainability by the credit institutions. Within the broad macro-economic framework, sustainability also has to be aimed at through improving productivity of bank employees, efficient fund management, maintaining financial links, better record-keeping, collecting and maintaining appropriate information, etc. All these tend to reduce the transaction costs significantly. The closer the system is to customer target groups, the more efficient it can become and as a result be able to lower the cost of credit. Since different partners in the process of financial intermediation comprising borrowers and credit institutions bear transaction costs of different magnitudes, a partial transfer of transaction costs to borrowers or NGOs may help to reduce the burden on financial intermediaries and increase their viability. Transaction costs may also be sharply reduced and access to financial services for new customers belonging to target groups may be expanded by financial innovations, such as formation of borrower groups, the use of computerised accounting and monitoring systems.

There are several other cost factors which should not be lost sight of especially while considering the turn-around of financial institutions. Human resource development and staff motivation, financial product development during the pilot phase and development of new financial instruments are some of these costs. Strategies may have to devised to enable credit institutions to meet these costs till they attain operational sustainability. NABARD provides grants out of Co-operative Development Fund to selected co-operative banks for

TABLE 7 ESTIMATES OF DEMAND FOR CREDIT DURING THE NINTH PLAN

(Rs crore)

Year	Demand		
	Short-term	MT/LT	Total
1997-98	22,500	10,875	33,375
1998-99	25,650	12,995	38,645
1999-2000	29,250	15,530	44,780
2000-01	33,500	18,608	52,108
2001-02	38,500	22,342	60,842
Total	149,400	80,350	229,750

such purposes and to RRBs from out of other promotional funds. In the long-run, however, institutions should be in a position to bear this cost from their own operational surplus.

Recovery Performance

The build-up of overdues has serious implications, since a large number of farmers who are still outside the purview of institutional credit suffer on account of non-availability of credit. The overdue position of different entities of rural credit delivery structure show that it has been an all pervasive phenomenon across different agencies. Co-operatives are a shade better than RRBs and commercial banks in the recent years in terms of overdue rates (Table 8).

Political intervention, deficiencies in loaning procedures of the credit institutions, especially those pertaining to appraisal, supervision and control have also contributed to the malady of high overdues [Desai 1990, Desai 1996]. Poor credit discipline and consequent build-up of overdues over the years have severely restricted the recycling of funds by rural credit institutions and thereby reduced their ability to sustain their credit operations. The high overdues have also impaired the eligibility of the credit agencies for availing of refinance facility from the higher tiers. This is particularly so in the case of RRBs and the co-operatives which heavily depend on NABARD for their lendable resources. Mounting overdues not only increase the risk but also result in increasing the transaction costs for effecting recovery. Ageing of overdues has added another dimension to the problem since these are to be classified as non-performing assets (NPA) of the banks and provisions have to be made accordingly. The NPA of commercial banks constituted 18 per cent of the total outstanding advances and in case of the RRBs it was 36 per cent (as at end-March 1997). In case of the co-operatives, overdues more than three years constituted 23 per cent of the total overdues for central co-operative banks and 31 per cent for SCARDBs (end June 1997) [RBI 1998]. This has happened despite the fact that a sizeable amount of overdues was written-off under the Agricultural and Rural Debt Relief Scheme, 1991. Wilful defaults which constitute a large proportion of the overdues are due to the perception of the borrowers that credit is dispensed due to political directives and as a result of the bankers' empathy with the borrowers. Unless banks strive hard to change this perception through building up appropriate rapport with rural borrowers and closely monitor the end-use of loans, the recoveries of bank loans may not improve. Another solution to this malady is through providing more autonomy to the lending institutions and at the same time making them accountable for their financial results. Poor response to the Crop Insurance Scheme and loss-making operation of the same have also contributed to non-wilful defaults. There is, therefore, a strong need for an effective relief mechanism to encourage institutional credit for micro-enterprises in agriculture and other economic activities in rural areas.

Risk Fund

In this context, the creation of a broad based Risk Fund may facilitate in taking care of the risks associated with natural calamities and failure of crops which could result in non-wilful defaults. The government of India, state governments, central financial institutions and banks could contribute to the fund. The constitution of a National Agricultural Credit Relief and Guarantee Fund was one of the recommendations of the All-India Rural Survey Committee for boosting agricultural lending. The ACRC and the Working Group also suggested the creation of such fund. This will be in addition to the existing National Rural Credit (LTO) Fund and National Rural Credit (Stabilisation) Fund maintained with NABARD.

Small Farmer Coverage

Access of small and marginal farmers to credit is limited due to several institutional and non-institutional factors [Majumdar 1995, 1996]. Not only is there need to provide access of credit to marginal and small farmers but their capabilities in adopting innovative technologies need to be built up. This would entail that banks not only provide access to credit but also render technical advice. In other words, a 'credit +' needs to be adopted by the banks to improve the credit absorption capacities of this clientele and in effecting recovery of loans. This would require the revival of the concept of 'Farm Clinics' or 'Krishi Gyan Kendras'. The recent suicides by farmers in various parts of the country underscores the need for such an approach.

The innovations experimented in micro-credit delivery using informal groups (self-help groups) and non-government agencies (NGOs) as both financial and/or non-financial intermediaries must be replicated for higher outreach of credit for agricultural development. Encouraging corporate bodies to enter into contract farming with small and marginal farmers will not only enhance the credit flow but also to some extent ensure effective recycling of funds.

Distortions in Sub-Sectoral Credit Flows

The sectorwise flow of term credit from institutional sources during 1997-98 revealed that the major share of credit disbursed was for farm mechanisation (28 per cent) followed by RNFS (16 per cent) and minor irrigation (13 per cent) [NABARD 1998]. This trend indicates that the lending by banks was by and large security oriented with anticipation of regular and assured income. Sectors allied to agriculture such as poultry, fisheries, etc, and non-farm activities were given relatively less priority in the loan portfolio of institutional sources. From the supply point of view, institutional agencies prefer to finance activities which have quick maturities and risk of default is relatively less than long gestation projects. Further, contribution to environmental upgradation through agro-forestry, plantations and horticultural projects do not get factored in the viability analysis.

On the demand side, prospective beneficiaries are also weary of availing credit for such activities in view of the long gestation period involved, adding up to the interest burden without commensurate returns in the initial years. Hence, credit flow for long gestation projects is rather subdued. This is clearly brought out by the decline in the availment of finance for tea plantations. A dual interest policy, therefore, will have to be adopted for two groups of sub-sectors within agriculture – one representing normal activity with low gestation and minimal risk of failure and the other representing investments which are prone to high risk coupled with having long gestation. Rate of interest to be charged for latter group of investments would have to be lower. Elongated repayment period than at present may also help to boost the demand for these investments.

TABLE 8: PROPORTION OF OVERDUES TO DEMAND, AGENCYWISE

Agency	1992	1993	1994	1995	1996	1997
DCCBs	34	32	32	30	31	31
SLDBs	50	48	43	38	39	31
RRBs	60	59	54	49	39	43
CBs	46	44	44	43	39	NA

Source: Reserve Bank of India, various issues of *Report on Currency and Finance*, Volume I for commercial banks and NABARD publications on co-operatives and RRBs.

Institutionalisation of wasteland development programme by involving quasi-government agencies/corporate bodies for developing vast stretches of publicly owned wasteland, will also give a big boost to the credit flow in this sub-sector.

Priority Sector Allocation

Recent policy changes in utilisation of priority sector allocation for Rural Infrastructure Development Fund (RIDF) by CBs, though a welcome step, may further contribute to shortage of credit flow for agriculture since the CBs may prefer the latter due to safety in loaning. Hence, there is a need to review the process of priority sector allocation norms and a suitable system must be evolved which should take care of both avoiding the shortfall in agriculture loans and improve infrastructure development.

Flow of Credit to Hi-Tech/Export-Oriented Projects

Flow of credit to hi-tech projects has always been in tune with the demand. Presently there has been a sizeable decline in financing of such units for a variety of reasons. These projects, especially export-oriented units, are found to suffer on account of low productivity, poor quality control, inadequate export price realisation, lack of infrastructure, marketing problems, etc [NABARD 1997]. To reverse the decline in the flow of credit to hi-tech agriculture sector, the major issues which may have to be addressed are (a) appropriateness of the imported technology for Indian conditions, (b) credibility of the collaborators, (c) buyback arrangements for produce, (d) dissemination of market intelligence by governmental agencies, (e) strengthening the infrastructure and support systems, and (f) consultancy support for new entrepreneurs. This also emphasises the need for upgrading the skills of the bank staff to properly appraise the projects relating to hi-tech/EOUs, so that all risks are accounted for in the appraisal system.

In conclusion, accelerating the pace of capital formation under public sector, ensuring remunerative prices for agricultural produce, infrastructure development with focus on transportation, marketing and other post harvest facilities, etc, will enable the rural sector to absorb more credit from institutional sources. Ensuring credit discipline through a ban on loan waivers would help in effective recycling of funds and creating a conducive environment for lending. Financial institutions and various government departments have to work in a co-ordinated manner to address the above issues for ensuring greater flow of credit to this sector.

Notes

1 Growth rates were estimated for three sub-periods, viz, 1970-71 to 1981-82, 1982-83 to 1991-92 and 1991-92 to 1995-96. The first sub-period to assess the impact of nationalisation on credit flow and the second sub-period to assess the impact of the establishment of NABARD with a mandate to channelise the flow of institutional credit to rural areas while the third sub-period coincides with the implementation of the financial sector reforms in the country. The number of observations being inadequate for the third sub-period, the results could at best be treated as indicative. The growth rates were computed using a semi-log function, i e, $\ln Y_t = a + bt$. The nominal values for short-term credit were converted to real terms (1980-81 prices) by using implicit deflators derived from value of inputs used in agriculture while in the case of term loans, the implicit deflators for capital formation for agriculture and allied sectors in private sectors given in the *National Accounts Statistics, 1998*, published by Central Statistical Organisation, New Delhi.

2 Credit from both formal and informal sources is used in agricultural production. Since reliable data on credit extended by informal sources are not available, any attempt to establish the relationship between short-term credit disbursed through institutional agencies and agricultural output is likely to result in over-estimation of the impact of credit. Notwithstanding the limitations, an attempt was made to assess the impact of credit on agricultural output and use of inputs. Time series data for 22 years from 1973 to 1995 for the identified variables were used for the analysis. The data on value of inputs used excludes the wage component.

3 In the absence of data separately on the credit flows to the RNFS, data on credit flows to artisans and craftsmen as well as other small-scale sectors by the commercial banks have been taken as aproxy and analysed for the period 1973 to 1995. Data have been compiled from *Banking Statistics, 1972-1995*, published by the RBI.

4 SIDBI was established in 1990 as another channel of refinance for the RNFS. Data on the extent of refinance and direct finance by SIDBI to rural units is not separately available. Further, SIDBI refinance operations are largely concentrated in urban and semi-urban areas.

5 The Planning Commission estimated the incidence of poverty at 37.4 per cent in 1983-84 and 29.9 per cent in 1987-88 while the Expert Group on Estimation of Proportion and Number of Poor, estimated the incidence of poverty in 1983 as 44.8 per cent and 39.3 per cent in 1987-88. For the period between 1987-88 and 1993-94, while the Planning Commission estimated that the population below the poverty line declined by 2.89 percentage points, a study conducted by Gangopadhyay, et al, of the Indian Statistical Institute, Delhi estimated the decline at 6.25 percentage points. Both the estimates are based on the methodology recommended by the Expert Group.

Institutional Change in India's Capital Markets

Ajay Shah

An attempt is made in this paper to understand the functioning of capital markets in India from the perspective of the need to strengthen the financial sector. A well functioning market is defined as one which performs the information processing function effectively and thereby channels capital wisely. This abstract picture is linked up with Indian institutional realities and contemporary debates about public policy in connection with financial markets.

FROM the early 1980s onwards, there has been a shift in India's economic policy regime, away from direct influence upon resource allocation by the state, towards a greater role for markets. One major plank of these reforms has been an attempt at developing financial markets as an alternative vehicle determining the allocation of capital in the economy.

In India, the financial sector (and securities markets in particular) attracted heightened attention from policy-makers in the aftermath of the scam of 1992. This led to a set of state initiatives on the equity and debt markets in the following years. In this article, we primarily deal with changes in institutions governing securities issued by firms, i e, shares and bonds.

In addition, the problems in east Asia in 1997 have led to a heightened appreciation, worldwide, of the vital importance for a developing country of a financial sector which effectively processes information and wisely allocates resources Stiglitz (1998) describes the financial sector as 'the brain of the economy'. Most policy- oriented economists have talked about the need for strengthening the financial sector.

In this article, we seek to understand the functioning of capital markets in India from this perspective, where a well functioning market is defined as one which performs the information processing function effectively, and hence channels capital wisely. We seek to link up this abstract picture with Indian institutional realities and contemporary debates about public policy in connection with financial markets.

I
Two Alternative Styles

Market economies use financial markets to guide resource allocation. Here, households create savings, and firms compete in obtaining access to capital. Every project proposed by a firm can be viewed as an idea to produce certain goods using certain technologies (this includes the choice of raw materials, technology and managerial team), and financial markets play a major role by denying resources to certain projects.

There are two fairly different approaches which can be adopted in allocating scarce savings to the most deserving investment projects.

One style of functioning, called 'OTC contracting' is based on direct evaluation by intermediaries who process information. This is the style seen in India in the traditional financing patterns of IDBI, ICICI, banks, etc. In OTC contracting, individuals who work for finance companies, such as IDBI, evaluate the merits of alternative projects which appear before them, and allocate resources to the projects which (they feel) offer the best risk/return tradeoffs.

The allocative efficiency of financial systems based on 'OTC contracting' depends upon (a) the information available to employees of these finance companies; (b) the incentives that they have to expend energy and effort in processing this information well; and (c) the incentives that they have to finally make decisions based on their analysis. In India, the operation of banks and financial institutions is unsatisfactory on all these three counts:

(1) The information set which is brought to bear upon project evaluation is limited.

(2) The contractual relationship between the finance company and the employee is not conducive to maximising the quality of information processing, especially with government-owned finance companies.

(3) Finally, there are external pressures which seek to distort funding decisions, especially with government-owned finance companies.

These three problems are hardly unique to India; they have afflicted banking systems world wide, with varying degrees of severity [Caprio 1997]. Weaknesses of information processing by banks played a prominent role in producing the east Asian crisis of 1997and Japan's macroeconomic problems today are partly related to the estimated $1 trillion in bad loans given out by the Japanese banking system. The recurrence of banking crises across time and space suggests that we should seek structural explanations. The three problems highlighted above are concerned with the poor incentives of employees of finance companies to process information wisely.

When OTC contracting takes place under institutional arrangements which inadequately address these problems, as is common with public sector banks and financial institutions in India, it is associated with poor information processing. Conversely, we may expect superior information processing when OTC contracting takes place under institutional arrangements which generate better incentives for employees, such as venture capital funds, private equity funds, and private banks.

The alternative style of functioning that can be adopted by a financial system relies upon securities markets. Here, trading on a secondary market for securities issued by a firm (primarily bonds and shares) determines their price. Firms can raise funds by selling additional securities, but the price that the newly issued securities command will obviously be quite close to those that were previously issued. The allocative efficiency of financial systems based on securities markets depends upon the extent to which security prices on the secondary market reflect the risk and return of alternative securities. In a well-functioning market, more risky securities should command lower prices – firms which seek to invest in more risky projects should suffer a higher cost of capital as compared with firms that embark upon less risky projects.

A key difference between OTC transactions and exchange transactions lies in the fact that trades on exchanges takes place under anonymity. This encourages a focus of information processing upon market prices. In contrast, OTC transactions take place between known counter-parties. Political and personal motives play a larger role with OTC contracting

This distinction – between transactions conducted OTC or through a securities market – is of central importance in understanding the different problems of different components of the financial system. In this article, we will focus upon the ingredients which engender effective information processing by securities markets.

II
Information Processing by Securities Markets

Information processing on securities markets is done by a class of economic agents called 'speculators'. Speculators form assessments of the fair value of a security, based on information processing about risk and return in the future. When a speculator feels that the market price of a security is low as compared with his assessment of the fair value, he buys the security, and vice versa.

The critical feature which fosters efficient information processing in speculative markets is incentive compatibility. A speculator works for himself, he directly earns profits if his information processing is accurate and he directly suffers losses if he undertakes trades based on poor information processing. This is in sharp contrast with the problems faced by banks and financial institutions in motivating their employees. In addition, as Milton Friedman observed many years ago [Friedman 1966], there is an innate process of selection through which speculators who do poor information processing tend to accumulate losses and exit from speculative activities.

It is possible to have corporate forms of organisation in speculation, such as mutual funds or FIIs which do active fund management. These would face the same problems faced by banks in terms of motivating employees in information processing. In India, around 90 per cent of the trading volume on the equity market comes from individuals. Hence, the bulk of the speculative activities on India's equity market are based on well-functioning incentive structures for successful information gathering and forecasting.

When a speculator buys a security trading at below its fair value, this action tends to restore its price closer to the fair value, and vice versa. In this fashion, the activities of speculators play an equilibrating role, pushing security prices towards levels which reflect a complete assessment of future risk and return.[1] The prices produced by modern securities markets are a public good; they can be observed at zero cost in newspapers or on the Internet.

Information flows into securities markets tend to be rich and diverse, owing to the broad-based participation in markets. This is in contrast with the restricted information flows that characterise OTC interactions. In the deeply interlinked production processes of the modern economy, a bewildering array of apparently unrelated information has a bearing upon the future risk and return from a security. Speculative markets give incentives to a wide variety of agents in the economy to obtain these pieces of information, and pool them into the publicly observed price. Company insiders, and the individuals outside the firm who directly interact with it, are often a valuable source of information when they choose to become speculators: they command a 'technology' for obtaining information and interpreting it at a low cost.

In summary, the modern securities markets can be viewed as an information processing device where 'workers' who obtain information and successfully process it are rewarded with speculative profits. The self-interest of myriad individual speculators in the economy is harnessed to obtain information gathering and analysis. This structure avoids the three problems listed in Section I which afflict information processing with OTC transactions.[2]

In recent decades, the term 'market efficiency' [Samuelson 1965, Fama 1970, Fama 1991] has been applied to describe the state where market prices accurately reflect forecasts of future risk and return associated with alternative securities.

III
Market Efficiency and Transactions Costs

If speculators are to gather and process information in order to obtain forecasts, their knowledge and analytical capabilities are obviously important. If we treat these capabilities as being fixed, then from the perspective of public policy, what institutional arrangements would maximise the quality of information gathering and information processing by speculators?

(1) Legal requirements for copious public information disclosure, and penalties for false information disclosure, would improve the information set available to speculators, and

(2) Institutions in the securities markets which impose the lowest possible transactions costs upon speculators would improve market efficiency.

The second objective – market institutions which minimise transactions costs – is a central idea in the normative economics of financial markets. Let λ denote transactions costs. A speculator who buys a security when the price is p_1 ends up spending a little more: $p_1(1+\lambda)$. Suppose he sells the security when the price is at p_2; including transactions costs he realises only $p_2(1-\lambda)$. In this sequence of transactions, termed 'a round trip', the transactions costs add up to $\lambda(p_1+p_2)$. On average, we think that p_1 and p_2 are close to each other, so the round trip costs are often approximated by $2\lambda p$.

A first, direct, consequence of transactions costs is that small mispricings (i e, deviations between market price and 'fair value') do not generate speculative corrections. If a speculator feels that a security is worth p and it is trading at p_t, no trade takes place if $|p_t - p| < 2\lambda p_1$. Hence, the speculative process cannot correct pricing errors inside the band $p_t + \lambda p_t$. Thus every level of transactions costs is associated with a degree of noise in prices. This noise has further ramifications which could seriously hurt market efficiency [DeLong, Shleifer, Summers and Waldmann 1990, Black 1986].

Suppose $|p_t - \bar{p}| > 2\lambda p_t$, and speculators do embark upon profitable trades. In this case, the round trip costs ($2\lambda| p_t$) diminish the profitability of speculative activities, and serve to diminish market efficiency. Speculators would expend smaller resources on obtaining and processing information in a world with a high λ.

Speculators are not the only users of the transactional services of securities markets. Trades which are not motivated by the objective of obtaining speculative profits are called *information-less trades*. Information-less users need to convert funds into securities or securities into funds for reasons external to market prices. A common example of information-less users in a market is the importers and exporters who trade on the currency market as a side consequence of their core activities; most orders placed by them are not attempts at obtaining speculative profits.

For information-less users, the equity and debt markets make it possible to participate in long-term projects while retaining the option of asset liquidation. This yields greater flexibility as compared with the debt contracts used in traditional financial institutions, which are held until maturity. This role of financial markets in providing liquidity has been known ever since John R Hicks. A modern extension of this argument is the idea of

the *liquidity premium*, whereby investors require a higher rate of return (at equilibrium) when transactions involve large costs [Amihud and Mendelson 1986].

Through these considerations, market liquidity also assists other economic agents; however these aspects are not as important as information processing by speculators, resource allocation, and the problem of maximising the economic growth obtained from a given supply of savings.

IV
Transactions Costs and Market Institutions

The above discussion focuses our attention upon low transactions costs as a central input towards obtaining market efficiency. In modern parlance, a 'liquid market' is one where transactions costs are low.

What determines transactions costs? At a basic level, *market size* obviously matters. If there are only a few buyer and sellers, then search costs will be high and transacting will prove to be costly. Large economies have an intrinsic advantage – it is relatively easy for the US government securities market to obtain high liquidity given the trillions of dollars of debt issued by the US government. Within India, smaller securities face greater hurdles in obtaining liquidity as compared with large securities. It is intrinsically easy to obtain a liquid market for the dollar-rupee (where importers and exporters assuredly generate around $ 80 billion in trading volume a year), and it is intrinsically hard to obtain a liquid market for a Rs 1 billion corporate bond issue.

From the viewpoint of public policy and institutional design, the size of securities cannot be altered. What policy can aim to do is obtaining the best possible liquidity for whatever securities exist. In this enterprise, myriad details of market design [Shah 1998b) assume importance. Market mechanisms influence transactions costs, and there is a rich interplay between problems of public policy, market mechanisms and transactions costs. When we translate the abstract problem of 'institutional development in the financial sector' into ground realities, one of the most important issues is the tangible problem of evolving market mechanisms which generate the lowest possible transactions costs.

Let us turn to the operations of a securities exchange, and analyse the multi-faceted hurdles faced by a user of the liquidity services of the exchange. The steps involved may be summarised as follows:

(1) Exchanges are generally inaccessible to users, except through intermediaries called 'brokers'. The user approaches a broker, conveys his requirements, and a trade could take place. Costs faced here include innate liquidity costs of the market and intermediation fees.

(2) The next step is called 'clearing', where the exchange assesses the net positions of all brokerage firms, requires exchange of funds (from buyers) for securities (from sellers), and handles defaulting brokerage firms (if any). If clearing works correctly, buyers who have paid money get securities, and sellers who have supplied securities get funds. When clearing fails to work well, it introduces risks for users of the market.

(3) The final step is called 'settlement', where new holders of securities try to actually transfer the title into their own names. When settlement processes fail to work well, they introduce costs for users of the market.

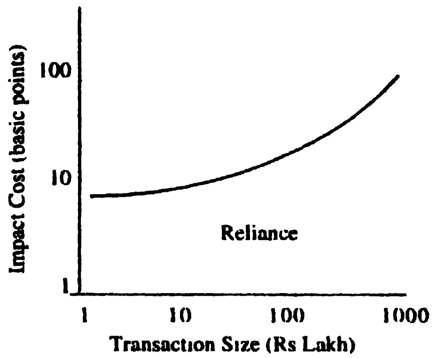
As we go through these steps of trading, clearing and settlement, users suffer numerous costs. Shah and Thomas (1998 (forthcoming)) offer a twelve-fold qualitative enumeration of these costs, with some insight into how alternative market designs impact upon them.

Denial of access. The first hurdle that users face is an explicit or implicit denial of access to market liquidity. This can take place owing to basic market structure. Inter-bank markets are notoriously inaccessible to non-bank users, who have to pay intermediation costs associated with a small club of banks who have market access. Another problem which leads to denial of access is primitive technology. In India's equity market, prior to the use of satellite-based communications, users outside Bombay effectively faced enormously higher transactions costs and were all but denied access to the market.

Market down-time. This cost occurs when a user wants to access liquidity services but is unable to do so because the market is closed (either because of holidays, a strike by exchange staff, a payments crisis, a technical breakdown, etc). A market which is closed is equivalent to a completely illiquid market. NSE's recent experience with unreliable satellites has generated massive transactions costs for many market participants.

Market impact cost. Every organised financial market has distinct prices for buying and selling small (predetermined) quantities, called 'ask' and 'bid' prices. For example, a glance at NSE today reveals that shares of Reliance are trading at 114.35/114.4. The difference between these is called the 'bid-ask spread'. These quotes pertain to a quantity of 50 shares. They mean that a buyer of 50 shares pays Rs 114.4 and a seller gets Rs 114.35. Larger transactions would, of course, show wider spreads.

FIGURE: LIQUIDITY SUPPLY SCHEDULE – ONE EXAMPLE



It is common to interpret (bid+ask)/2 as an 'ideal' price. In this case, it is Rs 114.375. Compared with the ideal price, a buyer of 50 shares pays a premium of Rs 0.025. This is 0.022 per cent above the ideal price. Then we say 'the market impact cost in buying 50 shares of Reliance is 0.022 per cent'. Market impact cost obviously rises for larger transactions, and can differ between buying and selling. Figure shows one example of market impact cost at all transactions sizes.

From an economic perspective, the bid-ask spread reflects the innate economic cost of liquidity services of the market. Once the basic structures of trading-clearing-settlement are well in place, market impact cost is the most important component of transactions costs. This is particularly important for large transactions.

Market inefficiencies. Users can be subjected to the risk of buying or selling shares at prices which are away from the true value. Specifically, when market manipulation is present, the typical information-less user loses money (on average) in connection with his transactions; these losses are best treated as transaction costs.

When a regulatory agency effectively enforces laws proscribing market manipulation, it thus serves to reduce these costs.

Unreliable order processing by broker. These are the costs introduced when brokers do not reliably execute orders given to them. Traditionally, on India's equity market, intermediaries attached a low priority to small investors, and gave

them unreliable services, driving up the transactions costs faced by small investors.

Reliable order processing is generally a question of the degree of automation of trading and associated support systems in brokerage firms. The degree of competition in the brokerage industry is also important in giving incentives to intermediaries to improve systems and be able to cope with a wide variety of users. Eliminating entry barriers into intermediation would generally improve the reliability of order processing.

Fees to intermediaries. We will distinguish between two components of the costs of intermediation: the fees directly charged which the user observes, and the less visible costs which users suffer in the form of prices which are different from the best prices available on the market.

Intermediation costs are strongly a function of entry barriers in intermediation. With free entry, intermediation costs drop to levels consistent with zero economic profit. However, entry barriers prevent this outcome on most financial markets.

The 'less visible costs' are closely related to the way in which the market is organised. The ideal market structure is one characterised by *transparency* and *price-time priority*. Transparency refers to the ability of a user to monitor the best buy and sell prices on the market at all times, and verify the price claimed by the intermediary. Price-time priority is a property of markets where every order is assuredly matched against the best price available in the country, and if two orders exist at the same price then the order which came first is given precedence.

India's equity market before 1994 suffered from these problems – entry barriers into intermediation, non-transparency and a lack of price-time priority and hence featured high costs of intermediation. India's debt and currency markets *today* suffer from these three problems also.

Counterparty risk. Most financial markets in existence have significant delays between the time the trade takes place and the time that the trade is completely settled. In this intervening period, the buyer and the seller are exposed to the credit risk of each other. If one leg defaults, the other experiences losses. This is called 'counterparty risk'. India's equity market has a long tradition of payments crises which have often halted the market.

The modern approach to coping with counterparty risk is the idea of 'novation', where a new credit enhancement institution called the 'clearing corporation', interposes itself into every transaction, buying from one leg and selling to the other. Even if one leg defaults, the clearing corporation fulfills its obligations to the other leg. Through this, the clearing corporation eliminates the risk to each side of bankruptcy of the other.

India's debt and currency markets are effectively restricted to a small club of banks, and hence feature low counterparty risk. However, this homogeneous club would require risk premia in order to trade with economic agents who are not club members. This serves as an entry barrier in intermediation. Entry into these markets would not be possible without a clearing corporation.

Initial margin. The credit enhancement of a clearing corporation is not achieved at zero cost; it requires that both sides pay collateral, called 'initial margin', to the clearing corporation. The cost of capital on this initial margin is a part of the cost of liquidity services that they face.

From a policy perspective, the initial margin charged by a clearing corporation should be the *minimum* level at which adequate safety can be obtained. Mistakes in either direction are common. Margin levels are either too low – which makes the clearing corporation vulnerable – or too high – which imposes excessive transactions costs upon users.

Back office costs. When users are forced to expend labour and capital into the processing of funds and securities after the trade, these 'back office costs' are a component of the transactions costs imposed by the market. Back office costs have traditionally been very high in India's equity market, owing to the use of physical share certificates, but the advent of the depository has generated dramatic reductions. Back office costs are particularly high in India's debt market through the lack of netting and a clearing corporation.

Resolving bad certificates. When markets suffer from stolen or fake certificates, this generates costs for the user. On India's equity market, this has led to large-scale criminal activities, with underworld elements involved in counterfeiting and theft of share certificates.

Once electronic settlement is done, at the depository, the probability of encountering bad paper drops to zero.

Delays in payments. When users are forced to pay in funds early, and receive funds late, they lose the time value of money. These delays derive from India's slow payments system, and from administrative inefficiencies.

Transaction taxes. Transactions taxes serve to reduce market liquidity (i e, raise transactions costs). There are three forms of transaction taxes in India today: stamp duty, the service tax on brokerage, and the SEBI transaction fee. Of these, stamp duty dominates. Stamp duty has been abolished for trades settled through the depository. It is a major hurdle preventing a liquid debt market. It is particularly onerous on the real estate market.

V
Political Economy of Institutional Change

As the preceding discussion implies, transactions costs are greatly influenced by the design of market mechanisms. Radical changes of market mechanisms are often the best way to produce dramatic reductions in transactions costs. However, such reforms have traditionally faced opposition from individuals who possess skills in *existing* market mechanisms. This is partly owing to the common problem that institutional change obsoletes existing human capital and necessitates fresh investments in obtaining skills. In addition, the resistance of market participants to institutional change is most pronounced when a new form of market organisation hurts revenues of intermediaries – e g, through improved market transparency or through reduced entry barriers into intermediation.

This gives us a paradoxical situation where many individuals who have excellent knowledge of existing market mechanisms (and their flaws) generally advocate conservatism in policy debates. Through the 1990s, market intermediaries and associations of intermediaries in India have generally advocated incremental change or no change, to existing market institutions. This problem is seen with stock brokers, in the context of the functioning of stock markets, and banks, on issues of new market mechanisms for the currency and debt markets.

This conservatism of market participants is not peculiar to India; it is observed in every country. The most important new idea in market organisation of the last two decades is computerised order matching, which is also called 'the open electronic limit order book market' [Black 1971, Glosten 1994]. This is a form of market organisation which has transparency and anonymity, both of which are inimical to market intermediaries who derive rents from non-transparent markets and cartel formation.

Electronic order-matching first appeared in small markets, like Toronto

and Mexico, or new markets, like NSE. These successes paved the way for adoption in larger markets, like Paris, Tokyo and London [Domowitz 1990, Melamed and Tamarkin 1996]. In November 1997, the London Stock Exchange commenced trading through order-matching, and Indian readers of *The Financial Times* witnessed a replay of the debates which took place in India's equity market in 1993 and 1994. In each situation, the introduction of computerised order-matching has encountered strong political opposition from existing intermediaries who foresee reduced revenues when market transparency improves.

VI
Institutional Change on India's Equity Market

The equity market was high on the reforms agenda after the scam of 1992.

Problems as of 1992

The problems of the equity market, at the time, may be summarised as follows:

(1) As of 1992, the Bombay Stock Exchange (BSE) was a monopoly. It was an association of brokers, and imposed entry barriers, which led to elevated costs of intermediation. Membership was limited to individuals; limited liability firms could not become brokerage firms.

(2) Trading took place by 'open outcry' on the trading floor, which was inaccessible to users. It was routine for brokers to charge the investor a price that was different from that actually transacted at. In fact, the normal market practice involved brokers charging users one single consolidated price, instead of unbundling the trade price and the brokerage fee.

(3) As with all trading floors, there was no price-time priority, so users of the market were not assured that a trade was executed at the best possible price.

(4) A variety of manipulative practices abounded, so that external users of a market often found themselves at the losing end of price movements. The BSE is run by brokers, which limits the quality of enforcement which can be undertaken against errant brokers.

(5) Floor-based trading, the inefficiencies in clearing and settlement (described ahead), entry barriers into brokerage, and the low standards of technology and organisational complexity that accompanied the ban upon corporate membership of the BSE led to an environment where order execution was unreliable and costly. It was typical for below 50 per cent of orders to obtain execution on a given day.

(6) Retail investors, and particularly users of the market outside Bombay, accessed market liquidity through a chain of intermediaries called 'sub-brokers'. Each sub-broker in the chain introduced a mark-up in the price, in the absence of the unbundling of professional fees from the trade price. It was not uncommon for investors in small towns to face four intermediaries before their order reached the BSE floor, and to face mark-ups in excess of 10 per cent as compared with the actual trade price.

(7) The market used 'futures-style settlement' with fortnightly settlement. This means that trading was supposed to take place for a fortnight until a pre-determined 'expiration date'. Open positions on the expiration date only would go into actual settlement, where funds and securities were exchanged. In practice, there was little discipline on ensuring a reliable fortnightly settlement cycle.

(8) A peculiar market practice called *badla* allowed brokers to carry positions across settlement periods. In other words, even open positions at the end of the fortnight did not always have to be settled.

(9) The efficiencies of the exchange clearinghouse only applied for the largest 100 stocks. For other stocks, clearing and settlement were done bilaterally, which introduced further inefficiencies and costs.

(10) The use of futures-style trading for a fortnight (or more), coupled with *badla*, is fraught with counterparty risk. Normally, collateral (margin) requirements are used to ensure capital adequacy, and reduce the fragility of the clearing system. Primitive notions of margins existed at the BSE on paper, but they were not enforced. A critical feature of the modern approach to clearing is 'novation' at a clearing corporation; the BSE has neither a clearing corporation nor novation. The BSE clearinghouse functioned on a best-efforts basis – if shares or funds appeared at one end, they would be delivered to the other; the clearinghouse itself took no interest in measuring and containing counterparty risk.

Small-scale problems of partial or delayed payments took place on every settlement, and major crises, which required closing down the exchange while a compromise was worked out, took place once every two to three years.

A recent and prominent example was seen in April 1995 in the context of shares of the firm 'M S Shoes', where a default involving a total exposure of Rs 180 million, and losses of around one-fifth of this, led to a payments crisis on the BSE which halted the functioning of the exchange for three days.

(11) The final leg of the trade was physical settlement, where share certificates were printed on paper. This was intrinsically vulnerable to theft, counterfeiting, inaccurate signature verification, administrative inefficiencies, and a variety of other malpractice. Involuntary and deliberate delays in settlement could take place both at the BSE and at the firm. Many firms used the power of delaying settlement as a tool to support manipulation of their own stock. The problems were somewhat simpler for investors in Bombay, who could physically visit the BSE broker, the BSE clearinghouse, or the company's registrar, and accelerate transfer. For investors outside Bombay, who lacked this recourse and were crippled by the exorbitantly expensive telephone system, delays of six months between purchasing a stock and the transfer of legal title were common. If stock splits, rights issues, or dividend pay-outs took place during this period, it was common for the purchaser to not obtain the benefits

These problems led to an extremely poorly functioning equity market. From late 1993 onwards, the Indian State embarked on a radical reforms programme which completely transformed market institutions [Shah and Thomas 1997]. This programme consisted of creating four new securities market institutions: the Securities and Exchanges Board of India (SEBI), the National Stock Exchange (NSE), the National Securities Clearing Corporation (NSCC) and the National Securities Depository (NSDL).[3]

SEBI

The Securities and Exchanges Board of India (SEBI) was formed in 1988. It has gradually adopted many important roles in the area of policy formulation, regulation, enforcement and market development. This is in contrast with conditions prior to SEBI, where exchanges underwent little scrutiny or enforcement.

Today, SEBI vets every element of market design in India's securities markets, it attempts enforcement against problems such as market manipulation and payments crises, and performs oversight of market intermediaries.

In late 1993, SEBI banned *badla*. This was a major milestone in two respects – this marked the commencement of a major role for SEBI, and it curtailed the market manipulation and systemic risk that accompanied *badla*. However, these reforms

were reversed in 1995 and late 1997 through efforts by SEBI to resuscitate *badla*.

NSE

NSE was a new exchange owned by IDBI, UTI and other public sector institutions. NSE is a securities exchange which marks a radical break with the past. The regime in which trading on NSE operates is characterised by four key innovations:

(1) The physical floor was replaced by anonymous, computerised order-matching with strict price-time priority.

(2) The limitations of being in Bombay, and the limitations of India's public telecom network, were avoided by using satellite communications. Today, NSE is a network of 2,000 satellite terminals at locations all over India. On a typical day, 3,500 traders login to the trading computer over this network. This is larger than the capacity of the largest trading floors in the world.

(3) The conflicts of interest, and lack of focus, associated with exchanges run by brokers were eliminated using a new form of exchange organisation: NSE is a limited liability company, and brokers are franchisees. Brokers do not own NSE, hence NSE's staff is free of pressures from brokers and is better able to perform regulatory and enforcement functions.

(4) Traditional practices, of unreliable fortnightly settlement cycle with the escape clause of *badla* were replaced by a strict weekly settlement cycle without *badla*.

Equity trading at NSE commenced in November 1994. The BSE responded rapidly by moving to similar technology in March 1995. The improvements that accompanied this regime – shift may be summarised as follows:

Transparency. Users could look at a price on a computer screen before placing an order.

Anonymity. Electronic trading is completely transparent about prices and quantities, and completely opaque about identities. The traditional importance of cartels and market manipulation on India's equity market greatly diminished owing to the completely anonymous trading environments.

Competition in the brokerage industry. The rise of NSE led to the entry of 1,000 new brokerage firms. This eliminated the profits that had been sustained at the BSE by restricting entry into the brokerage industry. This led to a sharp reduction in transactions costs through lower brokerage fees.

Operational efficiency. Automation eliminated the vagaries of manual trading.

Gains outside Bombay. Users outside Bombay, who faced many intermediaries on their journey to the BSE floor, benefited even more than users in Bombay. NSE's satellite-based trading gave equal access to the trading floor from all locations in India, and was a major impetus to financial sector development in cities outside Bombay.

NSCC

On the BSE floor, where trading lacked anonymity, there was a degree of control over counterparty risk that traders on the floor could exercise. If *A* knew that *B* was near bankruptcy, he could choose not to trade against *B* on the floor.

Anonymous trading eliminates cartels and greatly limits market manipulation; however it also eliminates this limited control over counterparty risk that economic agents on the trading floor possess. When anonymous trading began at NSE, it generated an extreme version of counterparty risk.

NSE found a modern solution to this problem: a clearing corporation which does 'novation'. The National Securities Clearing Corporation (NSCC) becomes the legal counterparty to the net obligations of each brokerage firm. If any firm goes bankrupt, NSCC lives up to its obligations to the other side. This eliminates counterparty risk and the possibility of payments crises.

The clearing corporation effectively supplies credit guarantees to all brokerage firms. It needs to ensure that its integrity is not violated when one or more brokerage firms fail. For this, clearing corporations need to evolve a sophisticated 'risk contanment' framework, involving collateral and intra-day monitoring. NSCC has a flawless record of reliable settlement schedules from inception, i e, from early 1996 onwards. It marks an important milestone in the institutional development of India's financial system.

NSDL

The final leg of a transaction is where the title on a security is changed from the seller to the buyer. Procedures in India, which used share certificates printed on paper, were fraught with operational costs and risk. Many criminal activities were based on the theft or counterfeiting of share certificates. In one episode, the problems in settlement on the equity market had macro-economic consequences: in late 1993, FII inflows into India were significantly hampered by the inability of certificate-processing systems in India to cope with the inflows of funds.

In November 1996, the National Securities Depository Ltd (NSDL) came into being. The depository maintains a computer record of ownership of securities, and dispenses with physical share certificates. This eliminates the potential for crime, and sharply cuts down the operational costs associated with physical share certificates. In 1997 and 1998, SEBI strongly supported the adoption of the depository by making it mandatory for institutional investors to settle through the depository for a stated set of stocks; this set has enlarged over time. As at the time of writing, two years after NSDL commenced operations, 52 per cent of the settlements taking place on NSE use NSDL. For the most important stocks in the country (members of the NSE-50 index), over 85 per cent of the settlements taking place on NSE go through NSDL.

Hence, the equity market has completed more than half of the problem of migrating to 'dematerialised' (or 'demat') settlement. It is likely that the complete transition, to an environment where *all* settlements are done electronically, will be accomplished by late 1999.

IMPACT OF REFORMS

India's equity market has been transformed owing to the reforms of 1994-98. These reforms have transformed market practices, sharply lowered transactions costs, and improved market efficiency. In no other part of India's financial sector has such a radical reforms agenda been executed, in such a short time.

It is interesting to observe that the direction adopted on the equity market in India was *not one that would follow from a mechanical adoption of market practice in OECD countries*. This is in contrast with commonly held positions in India, particularly on the debt and currency markets. The equity market in the US, for example, relies on floor-based trading (as opposed to electronic trading used in India). It relies on a market controlled by a closed club of intermediaries (as opposed to free entry into intermediation in India, with the exchange being outside the control of intermediaries). Similarly, many key ideas and techniques used in NSCC (value at risk) and NSDL (dematerialisation) are not found in securities market institutions of many OECD countries, where market designs came about many decades ago, prior to modern financial economics and computer technology.

Institutional development lies at the essence of these reforms, and along with a host of new market practices, four new institutions have arisen over this period: SEBI, NSE, NSCC and NSDL. Three of these – NSE, the clearing corporation and

the depository – were born in a remarkable two-year period from November 1994 to November 1996.

We can summarise these changes in two ways. The first consists of asking how elements of market design have changed. This is shown in Table 1. Improved ideas in market design should generate lower transactions costs. This is shown at two levels – Table 2 uses the qualitative classification used in Section IV above, and Table 3 tries to estimate the transactions costs, as per cent of price, faced by retail investors.

We see dramatic gains as compared to the situation as of 1994. For users of physical paper, transactions costs have halved; for those who have started using NSDL, transactions costs have come down to one-tenth of previous levels. For users of NSDL, transactions costs on India's equity market are now comparable to those seen on the best markets overseas. This is a remarkable accomplishment, especially considering that these reforms began as recently as 1994; within the intervening four years, the introduction of NSE, NSCC and NSDL has dropped transactions costs by a factor of ten, to levels comparable with the best practices observed internationally. The BSE has harnessed similar gains through the introduction of electronic trading and connectivity to NSDL; however BSE continues to suffer from counterparty risk owing to the lack of novation at a clearing corporation, and poor design and enforcement of the risk containment system.

If progress has been made on the issues of Section III – i e, lowering transactions costs – then have these had an impact on the issues of Section II, i e, the ability of securities markets to process information, and to form securities prices which accurately reflect forecasts of future risk and return associated with a security?

It is easiest to obtain evidence about these *changes* upon the BSE, since data from the pre-reforms period is also observed there [Shah and Thomas 1996]. Gains in liquidity do seem to have gone along with gains in market efficiency. In the post-reforms period, the time-series of stock returns exhibits statistical properties which are more consonant with market efficiency as compared with the pre-reforms period. This picture – of improvement in market efficiency at BSE – understates the gains obtained in market efficiency in India, since the major market in the country is now NSE, while these comparisons have been done against the post-reforms BSE.

Improvements in the securities markets, along with reforms on the primary market and capital account convertibility for foreign investors, have significantly altered the capital structure choices of Indian firms. In 1993-94 and 1994-95, firms significantly reduced their leverage through primary market issues of equity. The debt-equity ratio of the corporate sector as a whole dropped from 2.04 in 1991-92 to 1.3 in 1994-95.

Finally, Shah (1998a) offers some evidence about the information processing by the equity market. The P/E ratio (market capitalisation upon net profit) is a valuation measure which reveals expectations of the stock market. Firms which are awarded high P/E ratios by the market should be firms which have low risk and high expected growth. Table 4 shows the extent to which portfolios formed by sorting on P/E prove to have differential net profit growth *in the future*. These results suggest that information processing was poor in the early years through a combination of (a) weak institutions, (b) the scam of 1992, and (c) the policy surprises associated with the liberalisation of the early 1990s. In recent years, the 'forecast accuracy' of the market's P/E has improved considerably: this partly reflects a more stable policy environment and institutional development on the equity market. These results also show that P/E ratios forecast net profit growth as much as five years in the future.

VII
Institutional Change on India's Debt Market

Problems as of 1992

The problems of the debt market, as of 1992, may be summarised as follows:
(1) In 1992, debt trading took place without an exchange in the picture. Trades were bilaterally struck between known counterparties without anonymity. This form of trading suffered from the problems of OTC contracting. Personal and political influences impacted upon trade prices; each leg of the transaction was exposed to the credit risk of the other; there was no price-time priority to ensure that each trade took place at the best price in the country. Dealer markets suffer from a fragmentation of orders and trades; information about trades and trading intentions is not publicly visible. There is no sense in which a marketwide best-buy and best-sell price could be publicly observed.
(2) The problem of credit risk served to narrow the market down to a "club market", a set of participants with homogeneous credit risk.

Table 2: Qualitative View of Liquidity on India's Equity Market, 1994 and 1998

An approximate depiction of India's equity market in terms of 12 components [Shah and Thomas 1998 forthcoming]. The terms used in this table are approximate They reflect both a comparison between the transactions costs seen on these markets, and a comparison of how different these transactions costs are as compared to what they could be given improved market mechanisms. The values for 1998 assume the use of the depsitory and the clearing corporation.

Component	1994	1998
Trading		
Denial of access	High	Low
Market down-time	High	Low
Fees to intermediaries	High	Low
Unreliable order processing	High	Low
Market inefficiencies	High	Low
Market impact cost	High	Moderate
Clearing		
Counterparty risk	High	0
Initial margin	0	Moderate
Settlement		
Back office costs	High	Low
Bad certificates	High	0
Delays in payment	High	Low
Transaction taxes	Moderate	0

Table 1: Elements of Market Design on India's Equity Market, 1994 and 1998
(Eight elements of market design, derived from Shah (1998b))

Feature	1994	1998
(1) Product standardisation	Adequate standardisation	Unchanged
(2) Aggregation and revelation order flow	Fragmented market through geographical distance and through phone market. Order flow unobserved	Order flow observed on nationwide exchange(s). Fragmentation across exchanges and phone market persists, to a smaller extent.
(3) Intermediaries	Broker/dealers, fraught with agency problems. Oligopolistic pricing	Brokers, with much reduced agency problems. Competitive pricing.
(4) Anonymity	Absent	Complete
(5) Counterparty risk	Present	Absent on NSE
(6) Settlement	Purely paper	Partly through depository
(7) Enforcement/prosecution	Very poor	Poor
(8) Futures trading	Absent	Unchanged

(3) The lack of anonymity made it easier to form and enforce cartels. The Indian debt market is small when compared with the size of the largest five banks and a variety of manipulative cartels operated from time to time. Dealer markets are vulnerable to problems with cartels: the dealer market intrinsically involves a small number of entities, and once a few large dealers agree to form a cartel, the public observability of their actions makes it harder for a cartel member to fink.

(4) As with the BSE of 1992, the debt market relied on dealers rather than brokers. Every trade was structured as a dealer buying or selling in a principal capacity. As with the BSE, dealers did not unbundle their intermediation fees from the transaction price. Economic agents who traded against a dealer were unable to shop around looking for a dealer with the lowest intermediation charges. Economic agents who traded through any dealer had no guarantee of obtaining the best price, owing to the absence of price-time priority.

(5) Trading took place by telephone in Bombay. Hence, the debt market was effectively restricted to Bombay. This is similar to the BSE floor, which effectively restricted market access to Bombay.

(6) Since trades took place bilaterally, trade prices were not centrally reported and observed, even *ex post*.

(7) There were serious problems with settlement of trades. The Reserve Bank tracks ownership of government securities in a database called the SGL. All trades must be reported to the RBI, which records the change in title from the seller to the buyer. SGL was maintained manually.

(8) Market participants faced the risk of an SGL request "bouncing". Suppose A sold to B and then B sold to C. When B sent the change of title to SGL, there was a risk that this request would bounce if the first trade (B buying from A) had not yet taken effect.

Hence market participants took to exchanging "bankers receipts (BRs)" which were IOUs for bonds. When B sold to C, all that C got was an IOU where B promised to deliver bonds at some later date. This would translate into actual SGL entries after the $A \rightarrow B$ trade took effect. In practice, given the freewheeling nature of the market, it was only a matter of time before IOUs were issued on IOUs, and photocopies of bonds and IOUs were used as a basis for further IOUs. Dubious forms of netting took place as practitioners tried to reduce the complexities of settling trades, and innovated in finding new ways to abuse the system.

The purchase and sale of these IOUs effectively constituted highly leveraged transactions in the absence of internal controls and risk management.

(9) The protracted delays involved in settlement, coupled with the 'open interest' in the form of outstanding IOUs, led to grave reconciliation problems in the back offices of banks. These were particularly pronounced owing to the lack of modern computerised procedures in the back offices. Many major banks, including foreign banks, did not have a clear idea of what their positions were when investigations took place after the Scam.

(10) This confusion about settlement procedures spilled over into fund movements as well. Suppose a bank 'bought bonds' from X by paying money and obtaining an IOU. Suppose X later bought back this IOU by paying money. Over this set of transactions, the bank effectively gave a loan to X. The terms of this loan could be almost anything, negotiated between X and the dealer working at the bank. The complexity of reconciliation coupled with the inefficiency of the back office made it easy for dealers to disguise soft loans to favoured counterparties, implemented in this fashion, from their superiors.

This was the mechanics of how funds from the banking system found their way into *badla* financing on the BSE; they were short-term loans that were profitable for X as long as the stock market went up. Given the extreme leverage that was possible using *badla*, fairly modest sums of money could generate a significant impact upon stock prices. In this sense, the 'stock market scam of 1992' should better be termed the 'debt and stock market scam of 1992'.

These problems were present from mid-1980s onwards. However, the increase in transaction volume in the early 1990s, and the euphoria on the stock market

TABLE 4: RANK CORRELATIONS BETWEEN P/E AND FUTURE PROFIT GROWTH AT THE LEVEL OF 20 PORTFOLIOS SORTED BY P/E

All stocks are sorted by P/E (of 31st March of the year) and 20 portfolios are formed. The P/E and future net profit growth fo each portfolio is calculated, and Spearman's rank correlation is used to measure the association.

P/E in Year	Forecasting Net Profit Growth up to Year	Spearman Rank Correlation	Z
One-year out forecasts			
1990	1990-91	0.3624	1.58
1991	1991-92	0 1248	0.54
1992	1992-93	0.4271	1.86
1993	1993-94	0.1820	0.79
1994	1994-95	0 3594	1.57
1995	1995-96	0.8211	3.58
1996	1996-97	0.7173	3 13
1997	1997-98	0.6797	2.96
Two-year out forecasts			
1990	1991-92	0.0541	0 24
1991	1992-93	0.1068	–0 47
1992	1993-94	0 3789	1 65
1993	1994-95	0.5128	2 24

1990	1994-95	–0 0617	–0 27
1991	1995-96	0.4932	2 15
1992	1996-97	0.4586	2 00
1993	1997-98	0.6406	2 79

TABLE 3: TRANSACTIONS COSTS ON INDIA'S EQUITY MARKET

An attempt at quantifying transactions costs faced by retail investors (i e, with small delivery-oriented transactions). It is assumed that trades are done on NSE, using the clearing corporation, which leads to an elimination of counterparty risk; however, all other exchanges in India continue to exhibit counterparty risk. Similarly, NSE is the most liquid exchange, so the market impact cost is lowest here, but trades done on other exchanges would suffer higher market impact cost. For comparison, the best values observed internationally are included.

All values are in per cent, for a one-way transaction. For example, total transactions costs of around 0 6 per cent today mean that in order to buy shares worth Rs 100, the user must spend around Rs 100.6

Component	India			Best in the World
	1994	Today		
		Physical	Demat	
Trading				
Fees to intermediaries	3.00	0.50	0.25	0.25
Market impact cost	0.75	0.25	0.25	0.20
Clearing				
Counterparty risk	Present	0.000	0.00	0 00
Settlement				
Paperwork	0.75	0.75	0.10	0.05
Bad paper risk	0.50	0.50	0.00	0.00
Stamp Duty	0.25	0.25	0.00	0.00
Total	> 5.25	2.25	0.60	0.50

following the liberalisation of 1991, were the triggers which converted these systemic problems into a crisis. Most systemic crises in the financial sector are rooted in uncontrolled leverage; the scam of 1992 can be attributed to a two-stage leverage – one stage at the inter-bank debt market (using IOUs) and another on the stock market (using badla).

Innovations in Market Design after the Scam

Three major reforms took place after the scam:

Improvements to SGL. The RBI moved to computerise the SGL and implement a form of a 'delivery versus payment' system.

Enforcement of a 'trade for trade' regime. The RBI setup a strong regulatory system which required that every trade must settle with funds and bonds; IOUs and netting were prohibited.

Trade reporting at NSE. A limited degree of transparency came about through the Wholesale Debt Market (WDM) at NSE, where roughly half the trading volume of India's debt market is reported. WDM is not a 'liquid market' where trades can be executed. Yet, it marks a step forward insofar as it produces reveals useful data about prices and traded quantities intra-day.

These reforms have served to close the windows through which the pervasive failures of clearing and settlement generated the scam of 1992. Today, SGL works much more effectively as compared with 1992. IOUs and uncontrolled leverage are completely absent. In this sense, one objective, of preventing the recurrence of the scam of 1992, has clearly been met.

However, these reforms did not address the core problem of the debt market, the reliance on distributed dealers interacting by telephone in Bombay. This problem, and the 'trade for trade' regime, which forbids all forms of netting, is a major hindrance to obtaining market liquidity.

Impact of Reforms

We can summarise the changes which took place in two ways. The first consists of asking how elements of market design have changed. This is shown in Table 5. Improved ideas in market design should generate lower transactions costs. This is shown qualitatively in Table 6 using the qualitative classification used in Section IV above.

As a consequence of the reforms, India's debt market is much less vulnerable to systemic crises. However, the reforms have failed to obtain a liquid, efficient bond market. We can easily contrast the modest changes seen in Table 5 against the major changes which took place on the equity market (Table 1). Similarly, the altered transactions costs seen on the equity market (Table 2) are in sharp contrast with the modest changes seen in Table 6.

The central question faced in policy formulation connected with the bond market, today, is about how the market design can be altered so as to obtain a liquid, efficient bond market. We return to this problem below.

VIII
Problems Faced Today, and the Agenda for Reforms

From this conceptual and historical perspective, as we look forward from late 1998, what are the most important issues in the agenda for public policy?[4]

Transition to Rolling Settlement on the Equity Market

NSE took a major step when it moved from the unreliable fortnightly settlement cycle, historically prevalent in India, to a reliable weekly settlement cycle. Today, the BSE also uses a reliable weekly settlement cycle, albeit with *badla*.

These market practices are all instances of 'futures-style settlement'. This suffers from two kinds of blemishes – the 'spot market' prices behave like futures prices, and the regulatory problems that are normally observed on futures markets show up on the cash market. A futures market requires a different regulatory framework. Indeed many of the problems that have been observed on India's equity market are problems commonly seen on futures markets, and many of the solutions adopted in recent years are inspired by futures markets.

The international standard for the spot market consists of using 'rolling settlement' instead of futures-style settlement. The group of 30 has recommended that rolling settlement should replace futures-style settlement. Every major market, other than France, uses rolling settlement on the cash market. Futures-style settlement involves netting of positions through the settlement period (which is Wednesday to Tuesday in the case of NSE) and settlement of open positions a few days later (five days in the case of NSE). Rolling settlement allows netting only within the day; all open positions at the end of the day have to settle. A few days later (five days in the case of NSE), settlement takes place. This is called T+5 rolling settlement, to convey the idea that settlement takes place five days after 'T', the date on which trading took place.

Ideally, India's cash market should be based on four principles:

(1) Electronic trading with complete anonymity,

Table 6: Qualitative View of Liquidity on India's Debt Market, 1994 and 1998

An approximate depiction of India's debt market in terms of 12 components [Shah and Thomas 1998 forthcoming]. The terms used in this table are approximate. They reflect both a comparison between the transactions costs seen on these markets, and a comparison of how different these transactions costs are as compared to what they could be given improved market mechanisms

Component	1994	1998
Trading		
Denial of access	High	High
Market down-time	Low	Low
Fees to intermediaries	High	High
Unreliable order processing	Moderate	Low
Market inefficiencies	High	High
Market impact cost	High	High
Clearing		
Counterpart risk	High	Reduced
Initial margin	0	0
Settlement		
Back office costs	High	High
Bad certificates	High	0
Delays in payment	High	Low
Transaction taxes	Moderate	Moderate

Table 5: Elements of Market Design on India's Debt Market, 1994 and 1998
(Eight Elements of Market Design, Derived from Shah (1998b))

Feature	1994	1998
(1) Product standardisation	Adequate standardisation	Unchanged
(2) Aggregation and revelation order flow	Fragmented market through geographical distance and through phone market. Order flow unobserved	Unchanged
(3) Intermediaries	Broker/dealers, fraught with agency problems.	Unchanged
(4) Anonymity	Absent	Unchanged
(5) Counterparty risk	Present	Unchanged
(6) Settlement	Purely paper	Purely through depositary
(7) Enforcement/prosecution	Poor	Improved
(8) Futures trading	Absent	Unchanged

(2) Novation at the clearing corporation,
(3) All settlement through the depository,
(4) Rolling settlement.

The first objective listed here has already been fully met. Novation at the clearing corporation is taking place on the largest market (NSE) though not at other exchanges. The process of depository adoption is half complete. The missing link, today, is rolling settlement.

How would the transition to rolling settlement be achieved? It is common to point to four elements which pave the way for rolling settlement:

- *Depository adoption.* As mentioned in Section VI, depository adoption right now is half complete if we look at the overall equity market. However, there is an important subset of stocks (members of the NSE-50 index) where over 85 per cent of settlements are taking place through NSDL. For these stocks, this first requirement has been met.
- *Loans against shares.* RBI has been increasingly liberal in terms of policies about loans against shares, so the second condition is increasingly being met.
- *Stock lending.* SEBI's stock-lending scheme has been in place for over a year, but only a handful of stock-lending transactions have taken place. Several intermediaries (including SHCIL, Deutsche Bank, Reliance Capital and NSCC) have been working towards building viable stocklending facilities. When these are in place, the third condition will be met.
- *Equity derivatives.* It is now likely that trading in index futures will commence from January 1999. When this happens, the fourth condition will be met.

The outlook in each of these areas is hence promising. It is now useful to discuss the modalities of transition to rolling settlement. SEBI should draw upon the success story of its intervention in the context of adoption of the depository to formulate a similar strategy for rolling settlement. Currently, SEBI chooses a date T for each stock when it goes into a restricted list where institutions cannot settle using physical certificates. Additionally, a requirement should be placed that six months after T, that stock should *only* be traded using rolling settlement in the country; that futures-style settlement should be disallowed from this point onwards.

A hundred stocks – the securities which make up the NSE-50 and Nifty Junior market indexes – account for over 95 per cent of the trading volume in India. It is quite practical to see an ideal regime operating for these hundred stocks by middle 1999, embodying electronic trading, with novation at the clearing corporation and rolling settlement through the depository.

New Approaches Towards Market Design on the Debt Market

Settlement Procedures

Today, RBI requires that every trade on the debt market should settle, and this settlement takes between one to five days. Existing procedures for moving funds and securities are highly cumbersome. The back office of the largest bank is unable to process more than a hundred trades a day; this is in sharp contrast with the equity market where the smallest of NSE brokers process in excess of a thousand trades a day. The essential feature which generates this difference in transactions costs is the use of netting at the clearing corporation on the equity market, as a way to dramatically simplify settlement. The trade for trade regime, by forbidding netting, yields these enhanced transactions costs.

In the context of the equity market, the discussion above focused on the migration to a spot market based on T+5 rolling settlement, with depository settlement, as a short-run objective for reforms on the equity market. In debt markets, internationally, this process has gone into its logical destination in the form of 'real-time gross settlement' (RTGS) systems. RTGS is the ideal form of a spot market, where complete settlement is attempted a few seconds after the trade is struck. RTGS requires infrastructure for real-time movement of funds and securities.

It is interesting to observe that rolling settlement involves intra-day netting while RTGS involves no netting. In this sense, RTGS can be viewed as an implementation of RBI's existing trade-for-trade regime where the time elapsed between trade and settlement is shrunk to a few seconds.

Both alternatives – either rolling settlement with intra-day netting or RTGS – could possibly yield a liquid, efficient market given modern trading procedures. Both alternatives would work much better than the existing trade-for-trade regime. RTGS makes greater demands in terms of widely accessible infrastructure for instant movement of funds and securities.

However, there is a strong sense in which either procedure would fail to solve the problems of illiquidity and market inefficiencies on the debt market if the basic problems in trading are not resolved. We now turn to these problems.

Trading Procedures

Earlier, we have seen how the core failures of the trading process seen in Section VII have not yet been addressed. The debt market would obtain major gains in liquidity and market efficiency if four key principles governed trading: (a) anonymity, (b) price-time priority, (c) nation wide market, and (d) free entry into intermediation.

Anonymity eliminates personal or political influences upon price formation; it focuses the information processing of market participants upon prices and quantities. Cartel enforcement would become essentially impossible under anonymity.

Price-time priority consists of establishing market infrastructure which ensures that every order in the country is assured the best price. This would immediately emphasise the agency function of an intermediary. When an economic agent approaches an intermediary in order to execute a trade, the execution price would be the same regardless of which intermediary is chosen. The *market* would possess liquidity, and the intermediary would merely be a way of obtaining access to this liquidity. Intermediaries would unbundle their intermediation charges, and competitive pressures would start operating upon these fees.

A single nation wide market – as opposed to a club market operating by telephone in Bombay – would harness orders from all over the country. The pooling of these orders would generate enhanced liquidity. Conversely, a nation-wide market would carry the benefits of a liquid debt market to locations all over the country. The experience of the NSE has shown that India's financial sector is not located in Bombay – prior to NSE, 85 per cent of equity trading took place in Bombay, but today only 35 per cent of NSE's trading volume originates from Bombay.[5]

Finally, free entry into intermediation would shrink intermediation costs. Free entry into intermediation blends very well with a market that works with anonymity and price-time priority; incumbent intermediaries need not know or accept a new intermediary into their club in order to trade against him on an anonymous trading screen. However, free entry into intermediation does raise concerns about credit risk, which can be addressed using novation at the clearing corporation. Similarly, an RTGS system could implicitly throw up entry barriers into intermediation if RTGS requires forms of

connectivity into infrastructure for funds transfer which only a few intermediaries have access to.

Reshaping the debt market around these four principles would imply institutional change which would be comparable with the experience of the equity market from 1994 to 1996. It is likely that these changes would yield a much more liquid and efficient market.

Exchange-Traded Derivatives on Equity and Debt

Financial derivatives are tools through which risk exposures of economic agents can be rapidly altered at minimal transactions costs [Shah 1997]. The enhanced price volatility in the liberalised economic environment, coupled with the manifest advantages of markets where risk could be transferred among economic agents in the economy, has inspired many independent initiatives aiming to create derivatives markets in the country. In the equity, currency, debt and commodity markets, a variety of progress has been made towards the creation of markets for derivatives instruments, such as futures and options [Thomas 1998].

In addition to its allocative functions, the financial system can enable welfare-improvement through the reallocation of risk. Derivatives markets are a highly effective way through which this risk transfer can be achieved.

From the perspective of market efficiency, and the ability of the financial system to process information and formulate forecasts of risk and return, derivatives play a role in two ways. Derivatives trading generally tends to reduce transactions costs on the underlying cash market. Specifically, derivatives trading is an instrument through which market impact cost in Table 3 could become smaller. In addition, access to derivatives improves the profits from speculative activities; this leads to enhanced levels of investment in the economy into information production and information processing. Internationally, the onset of derivatives trading has been accompanied by enhanced levels of market efficiency.

In this section, we describe the role of derivatives in the modern economy, outline the building blocks required to build a derivatives exchange, and discuss some policy issues about derivatives markets in India.

The Role for Derivatives

Risk owing to price volatility is pervasive in the modern market economy. Drawing upon Mason (1995), we can employ a functional classification of the three major 'technologies' which the financial system offers for the reduction of risk:

Diversification. reduces risk through combining less than perfectly correlated assets.

Insurance. refers to securities or contracts which limit risk in exchange for the payment of a premium.

Hedging. refers to offsetting a risk exposure using a financial transaction.

Financial derivatives, such as futures and options, can be used for hedging and insurance, and hence help economic agents obtain better control over the risks that they encounter.

Components of a Derivatives Exchange

A derivatives exchange is made up of four components: the definition of a traded product, a trading mechanism, a clearing facility, and settlement procedures.

(1) *Product.* Derivatives exchanges trade completely standardised products. The exchange defines the traded product, and traders have no flexibility in altering the terms. An example of such a product could be a futures contract on an index, or options on a security, or options on coffee, etc. All aspects of the traded contract would need to be specified, including the expiration date, date of making delivery, the exact specification of the grade and quantity of the goods which will be delivered, etc. India's experience in this area is described in Chauhan (1997) and Thomas (1997).

(2) *Trading.* A derivatives exchange needs a trading system. The modern consensus in the securities industry is that liquidity is maximised using the open electronic limit order book market, where trading takes place in anonymity, where individuals all across the country have equal access to the trading floor, and prices and liquidity are transparent.

(3) *Clearing.* Trading on a derivatives exchange takes place anonymously: the buyer does not know the identity of the seller, and vice versa. This would only be feasible if credit risk were eliminated. This is done through novation at the clearing corporation.

(4) *Settlement.* Derivatives can involve the exchange of funds and goods. For example, the holder of an option to buy coffee might choose to exercise the option, delivering funds and taking delivery of coffee. The derivatives exchange needs to establish smooth procedures for settlement.

Is India Ready for Derivatives?

As we approach the date when trading in exchange-traded derivatives commences, many observers are apprehensive about the potential for fraud, bankruptcy, or crises emanating from this market. Hence, the question 'Are we ready for derivatives?' is often voiced.

The main effort towards building exchange-traded derivatives in India is that of NSE [Chauhan 1998]. NSE's developmental effort towards starting derivatives trading, i e, the four elements listed above, was completed in December 1996. After this, the onset of trading has been held up by regulatory and legal problems. SEBI's L C Gupta Committee, which was constituted to draft a policy framework for exchange traded derivatives in November 1996, submitted its report in February 1998 [Gupta 1998].

Some observers have advocated caution in the introduction of equity derivatives on the grounds that these are 'highly leveraged instruments'. However, given the use of futures-style settlement on the spot market for equity, a greater extent of leverage is already present on India's spot market for equity. The danger of a payments crisis on NSE's proposed index futures market is lower than that on the spot market on either NSE or BSE, which are presently the centres of highly leveraged trading in India. It is only when India's equity market moves into rolling settlement that we will see greater leverage on the index futures market as compared with the cash market. In addition, India's cash market for equity is fraught with risk owing to the use of physical certificates, where forgery and theft is common. The index futures market will be less risky in this dimension insofar as cash settlement is used.

Another source of concern is market manipulation. Index-based derivatives are intrinsically safer than the trading on the cash market, since it is much harder for manipulators to distort the level of an index as compared with the difficulties presently observed with illiquid securities on the cash market.

In summary, it appears that the risks with respect to clearing and market manipulation that derive from trading in index derivatives are lower than the risks presently observed with futures-style settlement on the cash market.

Areas where Useful Derivatives Markets Could Come About

The treatment above has emphasised derivatives based on the equity index, for three reasons: (a) this is one area where conditions are ripe for the onset of exchange-traded derivatives in India, (b) NSE and SEBI have developed the institutional mechanisms required to make

this possible, and (c) in the near future, there is little doubt that stock index futures and options will commence trading.

In one area, that of currency risk, a large derivatives market already exists in India in the form of the dollar-rupee forward market. Here, the migration from OTC contracting to an anonymous exchange environment (in the form of a dollar-rupee *futures* market) would yield improvements in liquidity and market efficiency.

There are several other areas where exchange-traded derivatives are similarly quite feasible, though much less progress has been made in terms of establishing the institutional framework and obtaining the regulatory approvals. These include futures and options on short-dated interest rates, and on a variety of commodities such as cotton, sugar, rice and wheat. In each of these areas, the onset of derivatives trading will give economic agents tools to alter their risk exposure when desired, and generate improvements in market quality (enhanced liquidity and market efficiency) on the underlying cash market.

IX
Conclusion

The east Asian crisis has led to heightened interest in the financial sector, and in the role of the state in a better functioning financial system. This article has documented a remarkable episode, from 1993 to 1996, when state interventions had a profound impact upon market quality on India's equity market. Over this period, SEBI rose from dormancy, and three new securities market institutions were created – NSE, NSCC and NSDL. These changes have taken place over an extremely short time-period.

On the subject of the equity market, the two central questions in the reforms agenda concern the initiation and expansion of exchange-traded derivatives, and a complete transition to rolling settlement. It is possible to obtain major progress on these problems within the coming year

Going beyond the equity market, the principles of market design and the institutional arrangements which have proved successful on the equity market can be fruitfully applied in three other areas: the market for government debt, the currency market, and commodity markets. These three areas presently feature primitive market institutions, as compared with the technological and institutional sophistication now visible on the equity market. The use of anonymous, electronic exchanges, with novation at the clearing corporation, is likely to yield major gains in market efficiency in these three areas as well.

Notes

1 See Hart and Kreps (1986 for a contrary example of a class of theoretical models where speculators can be destabilising. Friedman's intuition is best visualised as a process of natural selection. In Luo (1998), an extreme model where agents do not learn from their mistakes or by observing other agents, the natural selection process alone generates (asymptotic) market efficiency. To the extent that learning does take place, we may expect a greater convergence upon efficiency.

2 This perspective upon securities markets, and the role of speculators therein, is in sharp contrast with the hostility towards speculation which has dominated public discourse in India in the last fifty years. This is partly caused by confusing terminology: the term 'speculation' is often mixed up with 'market manipulation' or 'systemic risk'. We define speculation as the activity of gathering and processing information, which leads to valuation of securities on organised markets. This need not involve market manipulation or systemic risk in a well functioning financial system.

3 SEBI was created in 1988, but it was from 1993 onwards that it found its voice. NSE was created in 1993, but equities trading at NSE commenced in November 1994. NSCC was created in April 1994 and started performing 'novation' from June 1994 onwards. NSDL was inaugurated in November 1996

4 Also see http://www igidr ac in /~ajayshah for many related issues.

5 Ever since the early 1970s, retail investors have owned shares but not government securities, and SGL does not interface with retail investors. However, once SGL is linked to NSDL, the same procedures and distribution channels used nationwide by NSDL to account for half the settlement volume on the (highly retail) equity market become accessible to the debt market

Market Integration, Price Efficiency and Short-Run Dynamics

A Tale of Two National Stock Markets

Raghbendra Jha
Hari K Nagarajan

This paper models price dynamics in the two national stock exchanges. It is discovered that there are well-defined relations between stock prices in the long run in each of these markets. Hence market segmentation is strongly ruled out. Second, the short-run behaviour of stock prices is such that no stock price can be considered to be independent of the others. Short-run price movements are mostly random or unstable, but the impulse response function analysis suggests that the instability does not persist for long. Finally, there seems to be a marked difference in the reaction in the two markets for the same stocks in terms of the responses to firm specific and market specific shocks. This may point to differences in the types of traders in these two exchanges.

I
Introduction

SIGNIFICANT changes have been occurring in the Indian stock exchanges during the last few years. The origins of these changes can be traced to the introduction of a screen-based trading system in the National Stock Exchange (NSE) as an alternative to the open-outcry system prevalent on the Bombay Stock Exchange (BSE) in 1995. Since then the success of the NSE has been phenomenal. This can be gauged from Table 1. Between 1994-95 and 1996-97, the percentage share of the entire country's trading volume rose from 1.1 per cent to 45.6 per cent on the NSE. At the same time, the percentage share of trading volume across all other exchanges declined significantly.

The initial success of NSE set off a chain reaction. Fearing loss of trading volume, the BSE reacted by replacing its open-outcry system with a screen based trading system within one year. Since then, there has been no looking back. With NSE establishing more than 1000 VSAT terminals all across the country, small investors in remote parts can have the same access to trading opportunities as any sophisticated brokerage firm in Mumbai. Now BSE has introduced its own national network (BOLT) and the Delhi Stock Exchange (DSE) has followed suit. And more recently, the regional exchanges have created the Inter Connected Stock Exchange (ICSE) as a response to the new environment.

The underlying cause of these quantum changes is information technology. More importantly, information technology has facilitated disintermediation, thereby unleashing the forces of competition. The immediate impact of competition are (i) a fall in costs of transactions and (ii) transparency and price efficiency.

Under the open-outcry system on the BSE, traders located far away from Mumbai were at a severe disadvantage. A number of intermediaries were involved in arranging trades and transaction costs added up due to layers of intermediation. Screen-based trading systems like the one at the NSE significantly reduce the transaction costs (bid-ask spreads and brokerage commissions) incurred by investors. Many layers of intermediation are removed and buyers and sellers interact with each other directly. The expanded size of the market and the lack of direct intermediation result in lower transaction costs for investors.

While the reduced costs of intermediation is a definite benefit of the screen based trading system, it is the increase in transparency and the improvement in the price formation process that generate an increase in the level of trading activity. Under the old system in Indian stock markets, brokers could more easily manipulate prices given the complicated process of arranging a trade. This was not only a burden for investors who regularly traded, but also a major deterrent for potential investors.

The new environment of screen-based trading has also greatly enhanced the price formation process and market prices in India more closely reflect fundamental values than was the case earlier. With nationwide electronic exchanges in place, a trader sitting in Ludhiana can shop around and choose between the NSE, BSE, DSE and the regional exchange. Specialised traders (known as arbitrageurs) can take advantage of price discrepancies across these exchanges. Their activities render a more integrated nationwide market where current prices reflect the latest information available about a company. Markets where prices accurately reflect the latest information are known as price efficient. The existence of price efficient stock markets is crucial for funnelling household wealth into the most productive sectors of the economy.

In this paper we examine the structure of the Indian stock markets. We specifically study the extent of volatility and price efficiency of the two largest markets and the only national stock exchanges (Bombay Stock Exchange (BSE) and National Stock Exchange (NSE)). Conventional wisdom suggests that Indian

TABLE 1: PERCENTAGE OF TRADING VOLUME IN TOP FIVE EXCHANGES

Stock Exchange	Percentage of Total Trading Volume		
	1994-95	1995-96	1996-97
NSE	1.1	30.0	45.6
BSE	41.6	22.0	19.2
Calcutta	32.5	27.3	16.4
Delhi	5.6	4.4	7.5
Ahmedabad	3.5	3.9	3.2

markets are riven with speculation and not driven by any kind of market forces. On the surface this claim might seem logical. There are close to 23 markets that trade in the same stocks. Overall liquidity is extremely poor in most of these markets. We also find that prices are consistently different across these markets. However, a recent study [Jha et al 1998] has shown that prices of the same stock in these markets are well integrated. A complementary line of inquiry would examine the linkages of different stock prices in the same markets. This provides the motivation for the present paper. We choose NSE and BSE for the following reasons. (a) These two have the largest number of listings and therefore the highest market capitalisation; (b) most of the institutional investing is done in these markets; (c) 'conventional' wisdom in the investing community suggests that these may be the central markets.

It would be important to know the following (i) are the stocks in the two markets informationally linked over time? (ii) are the stocks in these markets inherently volatile? (iii) which of these stocks contribute to market stability? (iv) is there a difference betwe n these two markets in terms of the reaction of the listed stocks to (a) firm specific information and (b) marketwide information and, (v) are these markets inherently unstable?

Others have raised these issues in different context. Hasbrouck (1993) has investigated the information efficiency of markets that trade in the same securities. Andersen and Bollerslev (1997) examine the intraday periodicity of volatility in equity markets and show that most markets have cycles of volatility in response to information inflows. Harris et al (1995) have examined the stock markets in the US to test whether there is indeed a central market that provides information to the rest of the markets. However to the best of our knowledge there is no extant literature on price transmittals within a given market either in a developed economy or in the context of an emerging market.

The remainder of this paper is divided into five sections. In Section II, the process of data construction is described. In Section III, the methodology used is explained, Section IV states the results and Section V provides certain concluding remarks.

II
Data

There are close to 7000 stocks listed in BSE while this number is around 1000 in the NSE. However not all these stocks trade with any degree of frequency. In the BSE, the number of stocks that trade at least daily is 1300 while it is around 950 in NSE. For the purposes of our study, we have chosen the 10 stocks with the highest market capitalisation. This seems to have a bearing on their respective frequencies of trading. The stocks chosen are shown in Table 2. We note that they represent a range of industries.

Intraday data for the period July 1, 1996 to July 30, 1997 from these two exchanges for the abovementioned 10 stocks were collected. We however find that there is an inherent asynchronicity in data for the chosen stocks. For example, the stock SBI trades more than 2,700,000 times during the period while, the slowest is BHEL

Table 3: Size of the Data Set

Market	Stocks	Average Time Elapsed between Transactions (Seconds)		Data Points	
		Slowest Stock First	Fastest Stock First	Slowest Stock First	Fastest Stock First
NSE	HLL, BHEL, ICICI, Colgate, L and T, ACC, Tisco, Telco, RIL, SBI	46	34	48,500	41,150
BSE	HLL, BHEL, ICICI, Colgate, L and T, ACC, Tisco, Telco, RIL, SBI	51	38	33,225	27,250

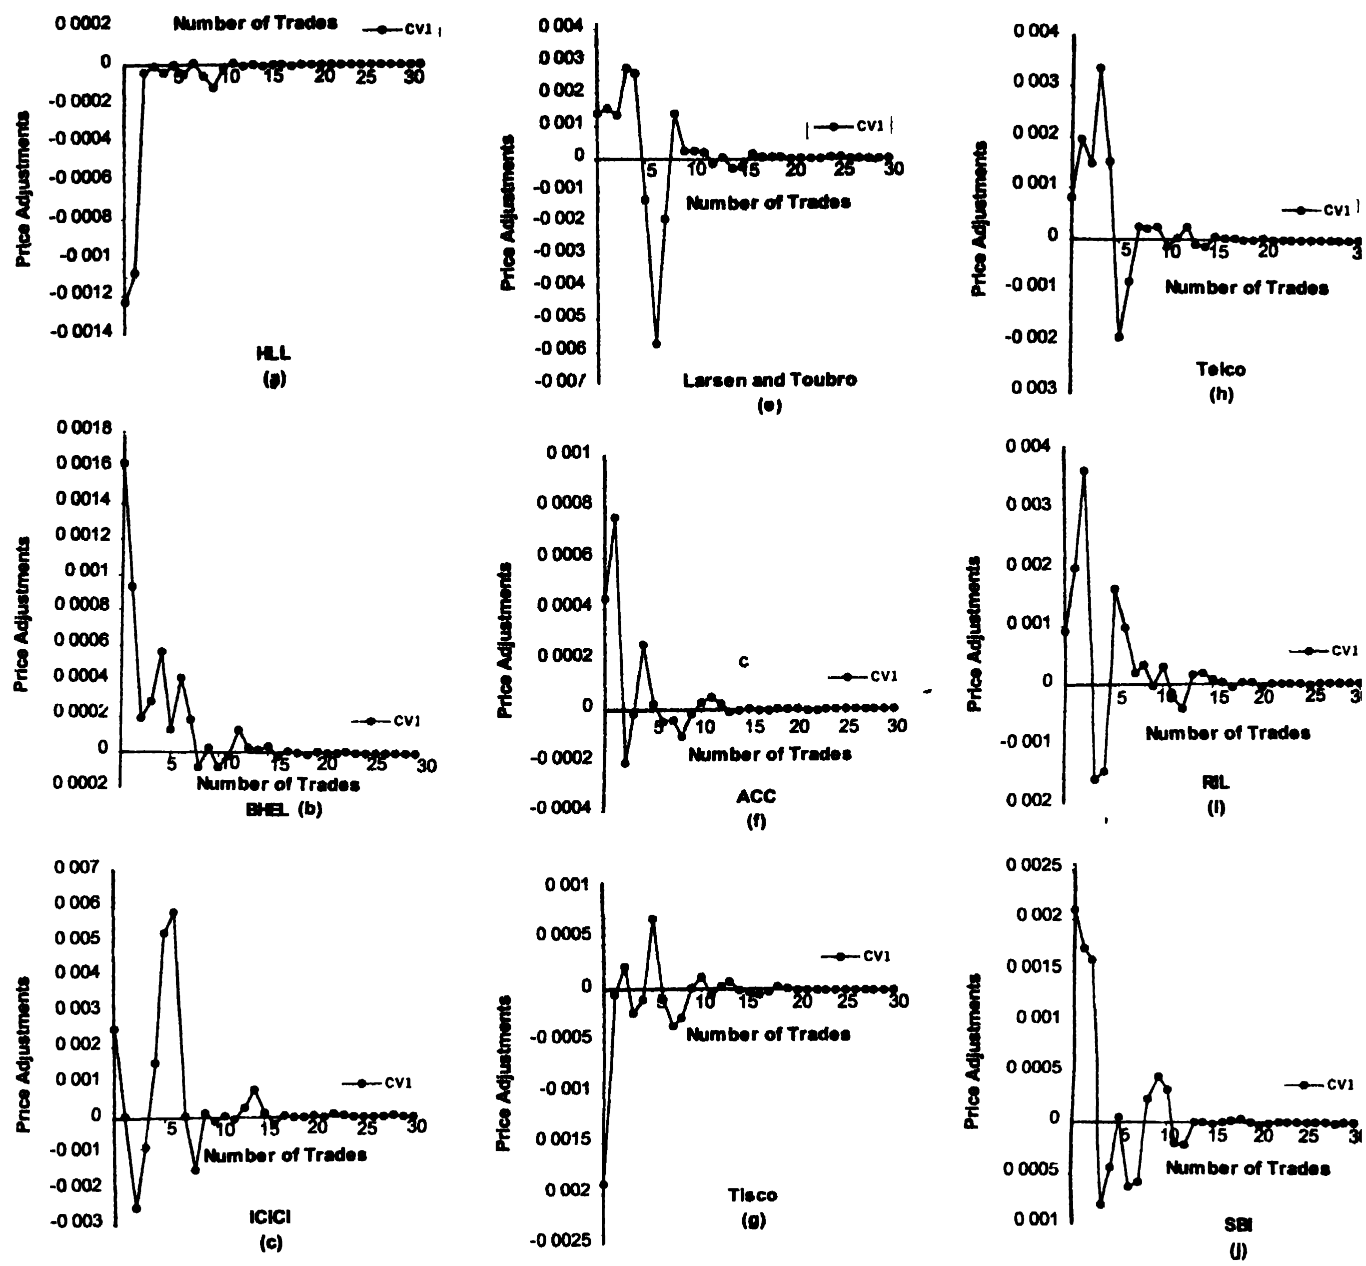
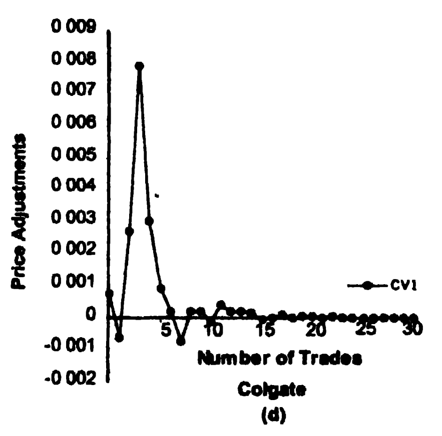
BSE	L and T, Tisco, RIL	Telco, SBI	ICICI, Colgate, ACC, Tisco, Telco

Figure 2 Impulse Response of Major Stocks Traded in BSE



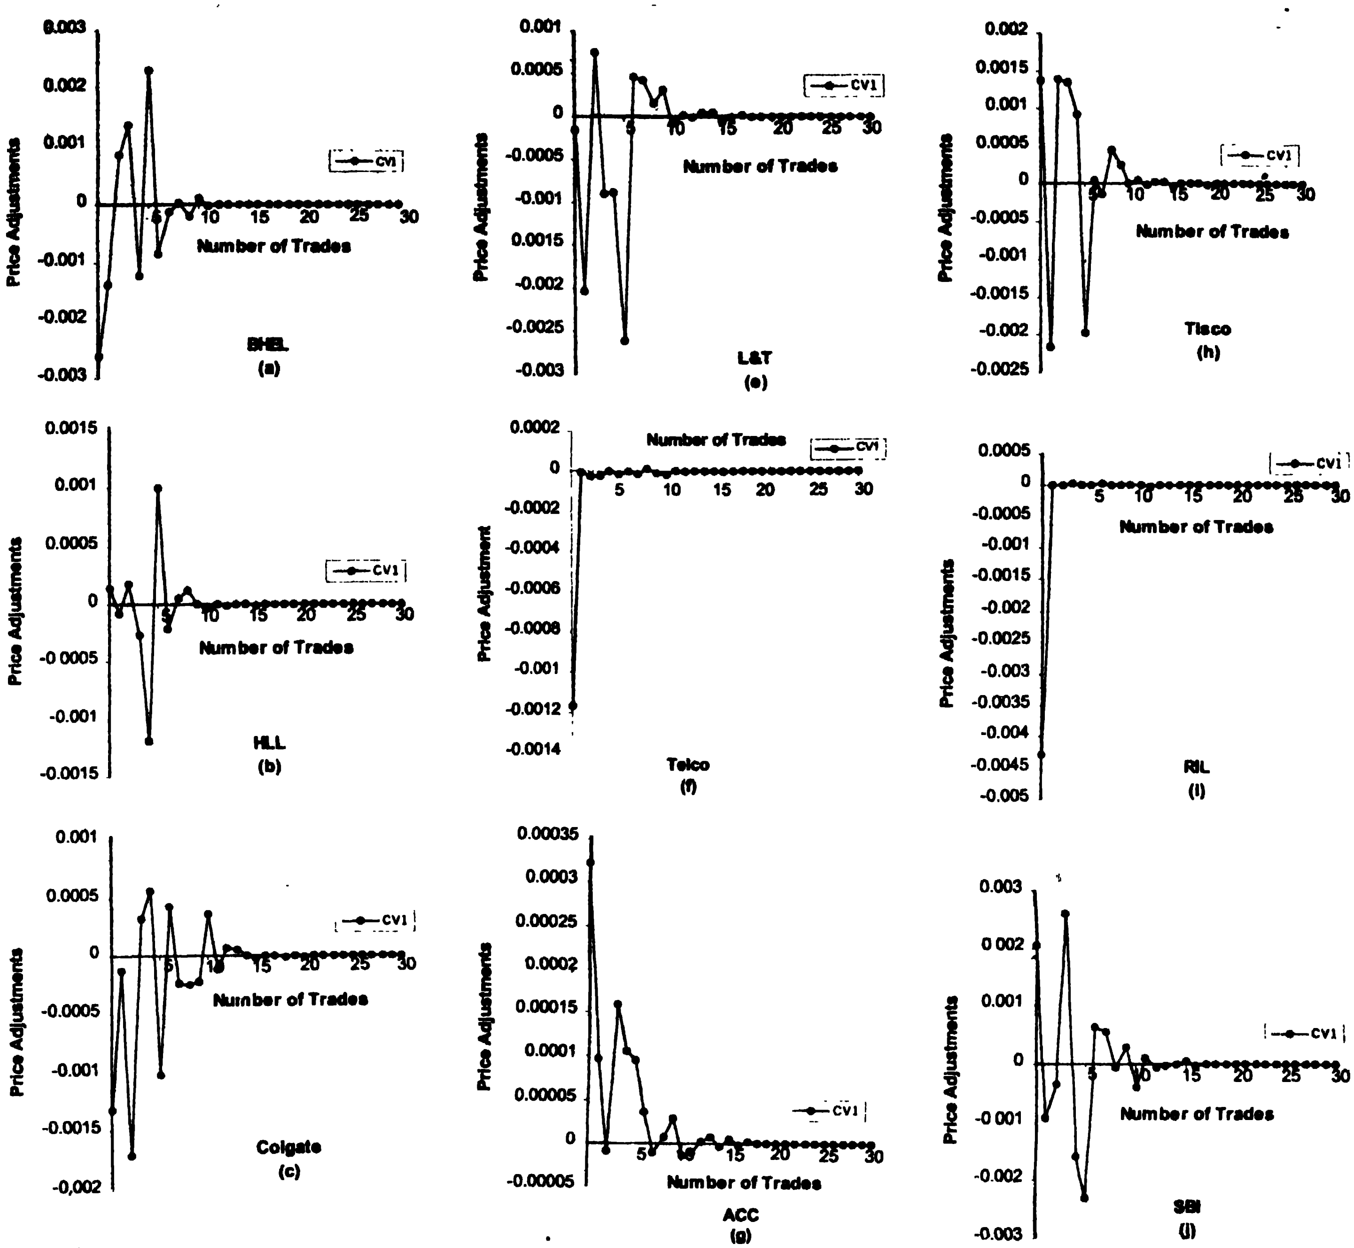


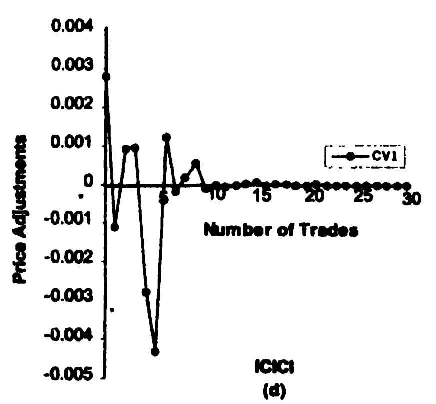
with 88,000 trades This implies that we should not compare the raw data for inferring dominance or otherwise of any given stock Usage of this data would mean that meaningless' transaction prices could be used for inferring price discovery Hence, a method based on Harris et al (1995) is used to construct matched data sets The reaction of the prices of a given stock to changes in the prices of the other stocks in the same exchange can be detected only if synchronous data is used. The procedure to construct this data set is outlined below

Consider three stocks – M_1, M_2 and M_3 – where M_1 is the slowest and M_3 is the fastest over the chosen time interval The speed of trading of a stock is an indication of the liquidity in terms of the number of times a given stock trades To construct the matched data set, once the slowest stock trades, the immediate past trade in M_2 and M_3 are chosen This is shown in Figure 1 Time in figure (1) is the clock time The first trade in M_1 is at a The closest trades in the other stocks are b, and, c Hence the first triplet is (a, b, c) We similarly construct other triplets such as (a_1, b_1, c_1), (a_2, b_2, c_2), etc

In this paper, we use a hybrid of 'replace all' and 'minspan' outlined in Harris et al

FIGURE 3: IMPULSE RESPONSE OF MAJOR STOCKS TRADED IN NSE





(1995). Under replace all, only the closest prior price of the other stocks are chosen. Under minspan the criterion is minimising the time differential between a given trade in the slowest stock and the corresponding trades in the other stocks. In a way, replace all is a subset of minspan in our case. In the hybrid version we combined the two methods of replace all and minspan. Trades could be either prior to the slowest trade or occur after it.

It is obvious that, the size of the data set will be determined by the speed of the slowest stock. A problem that might be encountered in using such a data set is the masking of the price discovery process by the bid-ask bounce of a trade across stocks. That is, a trader could trade at the bid on one stock and at the ask on the next. This type of trading could mask the price discovery process. Harris et al (1995) have raised such an issue. Following their paper, we also construct data sets by changing the order of the stocks shown in Figure 1. The data set is now governed by the fastest stock. The size of this data set is also shown in Table 3.

III
Methodology

The methodology adopted here allows us to ask the following questions: (a) Are stock prices related to each other in the long run in these two markets? (b) How does the price of a stock in a market move in the short run? Short-run price movements of a stock in a given market can be determined by its own past prices or, in the context of integrated stocks deter-

Figure 4: Reaction of Shocks Traded in BSE to Firm Specific Information (Top Five Based on Market Capitalisation)

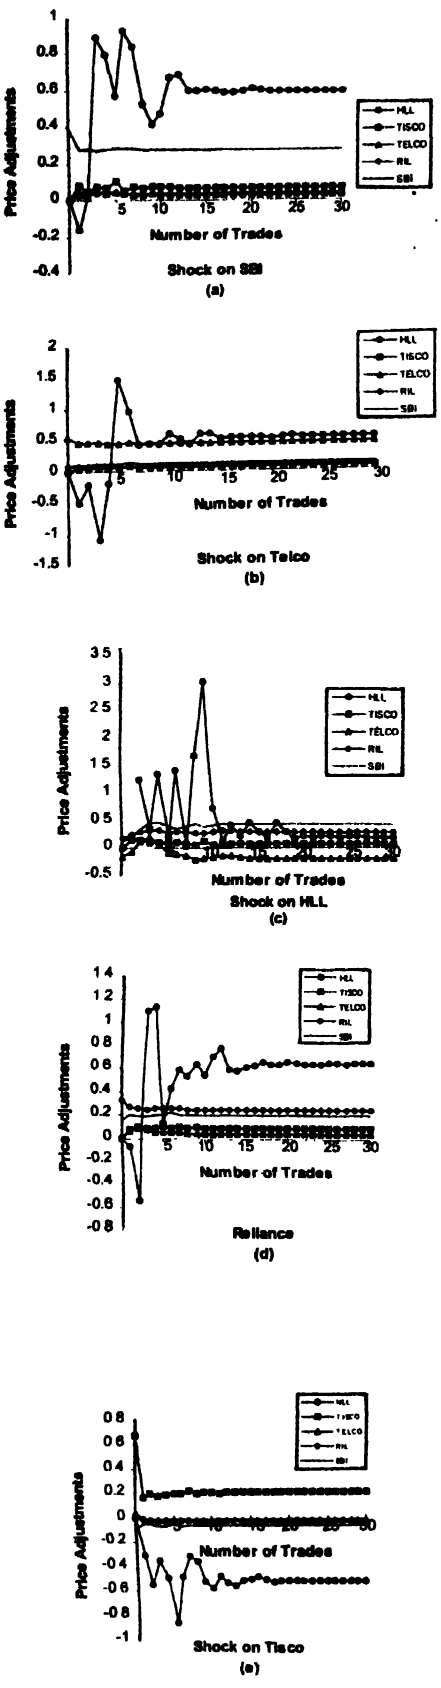


Figure 5: Reaction of Shocks Traded in BSE to Firm Specific Information (Last Five Based on Market Capitalisation)

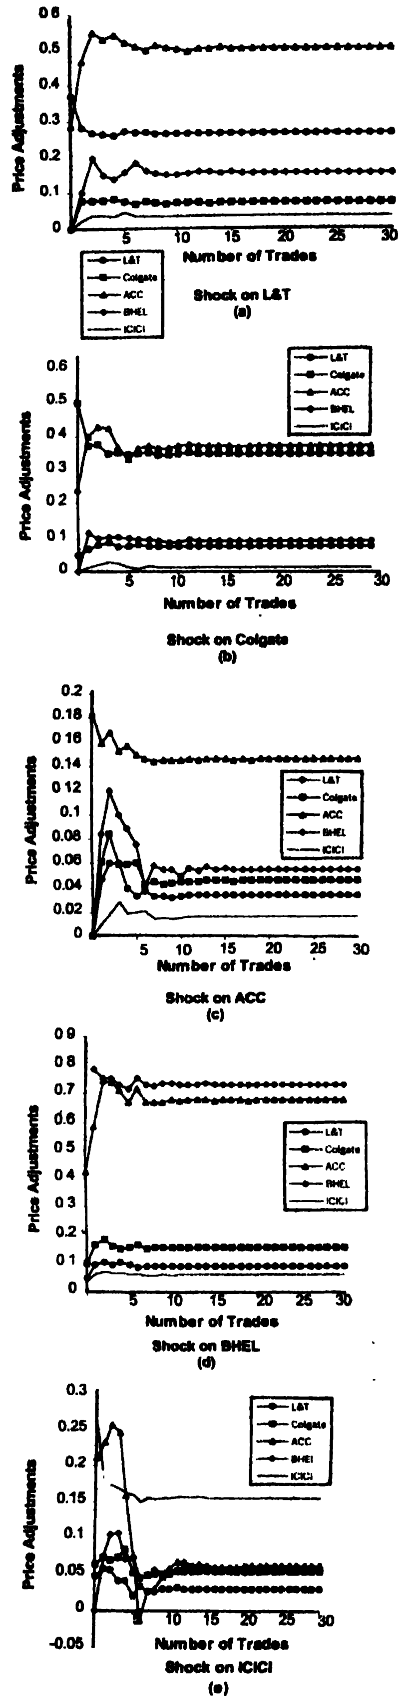

mined by the past prices of other stocks (c) Are the short-run price movements stabilising? Stock prices in the short run can adjust in various ways. A stable form of adjustment is, when the prices adjust such that the long-run relationship between the stocks is reached quickly. (d) Is there a stock in any one of these two markets that is exogenous to the process of price formation? These stocks for which changes in prices of other stocks do not matter are exogenous and, in some sense, are prime movers in the market. (e) How does the stock respond to an orthogonal shock? This is analysed using Impulse Response functions. We examine how the price of a given stock evolves over time in the two markets in response to a random shock. It is possible to check whether the price response is mirrored across two exchanges. Any differences in the response will bring out the inherent structural differences of these exchanges. We also examine if the price response is stock specific. That is, would the response be different if we considered a large stock, a stock belonging to a finance firm, etc.

Impulse response function analysis imposes a one-time orthogonal shock and does not have any dynamics of its own (that is, this shock is not part of a larger system of shocks in the market). The information released by this shock is a marketwide information, which is to be distinguished firm-specific information.

(f) Is NSE structurally different from BSE in the sense that prices in the two markets for the same stock react differently to shocks? These shocks may be to a particular stock (in which case the first round effect would be on stock prices of similar industries) or systemwide shock in which case there may be a general effect on all stock prices. It would be particularly interesting to know whether there are systematic differences between the BSE and the NSE in regard to reacting to these shocks. Such differences, if present, would indicate structural differences between the NSE and the BSE which may be the result, among other factors, of differences in settlement cycles, types of traders and so on.

Each of the price series we used was discovered to be integrated of order one. Hence, the only way to examine whether each of the stocks contributes to the overall process of price formation is through the method of cointegration. Since there are more than two prices in each market we should permit for the existence of more than one cointegrating vector. This is possible using the method of Johansen and Jueslius (1990).

Figure 6: Reaction of Shocks Traded in NSE to Firm Specific Information (Top Five Based on Market Capitalisation)

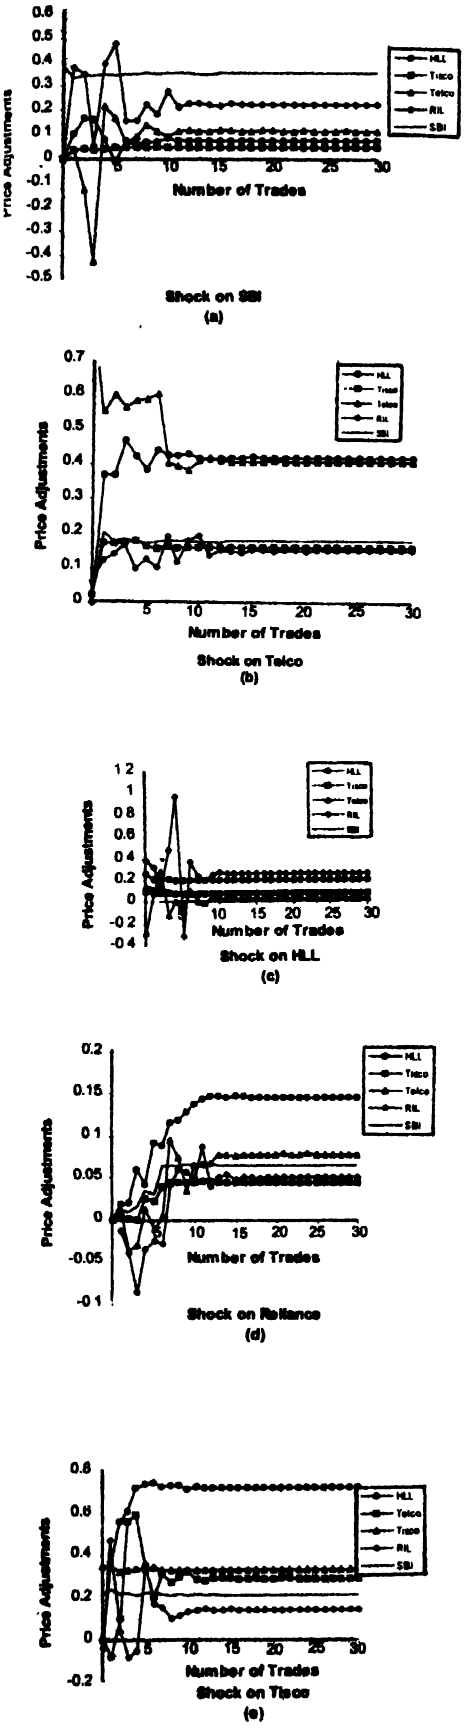

Figure 7: Reaction of Shocks Traded in NSE to Firm Specific Information (Last Five Based on Market Capitalisation)

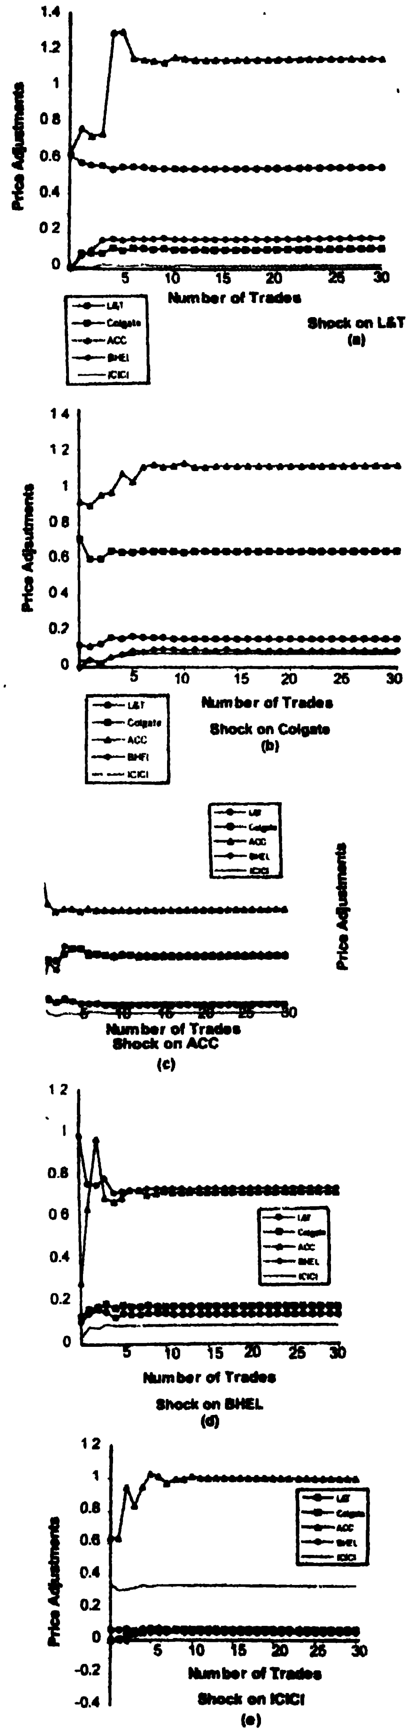

The Johansen and Juselius approach defines an unrestricted vector autoregression (VAR) of the vector of variables z_t as involving upto k lags of z_t.

$$z_t = A_1 z_{t-1} + \dots + A_k z_{t-k} + u_t$$
$$u_t \sim IN(0,\Sigma) \qquad \dots(1)$$

where z_t is (nx1) and each of the A_i is an (nxn) matrix of parameters.

Now consider an (nxr) matrix β such that

$$\beta' z_{t-k} \sim I(0) \qquad \dots(2)$$

If all elements of z_t are I(1), then the columns of β must form cointegrating parameter vectors for z_{t-k} and hence z_t. Since there can be only (n–1) cointegrating vectors, β must have r less than n. If however, z_t is I(1) but the elements are not cointegrated, β must be a null matrix. Now define another (nxr) matrix α such that:

$$-A_k = \alpha\beta' \qquad \dots(3)$$

The Johansen technique is based upon the factorisation of (3). This technique involves reducing (3) to solving an eigenvalue problem. The eigenvectors associated with these eigenvalues are the cointegrating vectors.

We will write the Generalised Vector Error Correction Mechanism (ECM) of the system in (1) in its final form as:

$$\Delta z_t = \Gamma_1 \Delta z_{t-1} + \dots + \Gamma_{k-1} \Delta z_{t-k+1} - \pi z_{t-1} + \xi_1(EC_1(-1)) + \xi_2(EC_2(-1)) + \dots + \xi_r(EC_r(-1)) \qquad \dots(4)$$

Where $\Gamma_i = -I + A_1 + \dots + A_i$ (i=1,...,k) and $EC_j(-1)$ is the one period lagged error term when we use the jth cointegrating vector and there are r such error terms - one for each cointegrating vector. ξ_j is the coefficient on the lagged error term from the jth cointegrating vector. Clearly, the vector Δz may include a time trend, constant and other non-stationary variables.

To investigate for exogenity of changes in prices we proceed as follows. If the F statistic for the ECM is insignificant we conclude that the dependent variable in question is weakly exogenous. A negative and significant sign of the coefficient on the lagged value of the error correction term would indicate stable adjustment whereas a positive and significant sign would indicate unstable adjustment. If, in addition to weak exogenity, we find that the coefficient on lags of variables other than the variable under investigation are insignificant then we say that the variable is strongly exogenous. Only its own lags rather than changes in the values of other prices influence it.

Dynamics of the model can be further investigated by considering the model in

a VAR(1) format:

$$z_t = A_1 z_{t-1} + \varepsilon_t$$

which has a vector moving average representation (VMA).

This can then be orthogonalised so that the error terms are not correlated and written as

$$z_t = \sum_{i=0} \phi_i e_{t-i}$$

where the residuals e_{t-i} are orthogonal. The matrices ϕ_i are the impulse response functions since they represent the behaviour of the modelled series in response to shocks (innovations) and the vector e_t is the vector of innovations: the vector of impacts induced for particular variables when these impacts are independent from each other

Short-run behaviour of prices, therefore, provides information on whether any one stock is dominant in any market. Furthermore, it shows whether the short-run behaviour of prices is stable. The impulse response function then gives us some idea of the duration of instability, in case we find such instability obtaining.

IV
Results

Tables 4 and 5 provide the summary of the results. The results of the Error Correction Model can be had from the authors. The impulse responses are shown in Figures 2 and 3 and Figures 4 to 7 show the nature of the reaction of stock prices to firm specific shocks. There is a single cointegrating vector for BSE while there are two for NSE.

The estimated ECMs are subjected to a number of diagnostic tests to ensure that each regression equation is well specified. This includes Lagrange Multiplier tests for serial correlation and ARCH up to several lags, normality of residuals and RESET tests. In each case the performance of the equation was satisfactory. These results are not reported here to conserve space. The following points are to be noted.

(i) In BSE, the F test statistic is strongly significant in each case so that the ECMs appear to be well specified. Thus all stock prices are endogenous and there is no exogenous stock which influences other stocks but is not influenced by them. Overall, the short-run instability is quite high. Short-run adjustment occurs only for L and T in the case of BSE. In the NSE, there are three stocks, viz, Larsen and Toubro, Tisco and SBI whose short-run behaviour is stable whereas Telco and RIL are unstable in the short run. F statistics are strongly significant in the case of NSE as well. Hence no stocks are exogenous.

(ii) The Error Correction Model also shows that the relationship between large and small stocks is not symmetric in the two exchanges. The stocks SBI and BHEL show a positive (but weak) relationship in BSE while in NSE, a change in price of SBI causes a significant decline in the price of BHEL and vice versa.

(iii) The impulse response functions show that the stocks traded in both the exchanges behave as though they are different commodities. This is due to the differences in the settlement cycles in these two exchanges. Hence short-run arbitrage possibilities are existent.

(iv) The markets are for the most part informationally efficient. This is shown by the impulse response function. We find that any orthogonal exogenous event only creates extremely short-run (no more than 15 trades on an average) perturbations. The duration of this short run is, hence, no more than a few minutes.

(v) The cointegration vector table (3) for these stocks in the two exchanges differ. Neither the magnitude nor the signs of the long-term adjustment of prices are symmetric in these two exchanges. This points to persistence of differences between the BSE and the NSE.

(vi) Another important point that has to be noted is the fact that short-run price adjustments in the two markets show considerable variation (Table 5). Some stocks cause instability whereas others have a stabilising or random influence. Nevertheless, the presence of cointegrating relations in both markets indicates that there are long-run relations between these stocks in both markets.

(vii) The structural difference between the two exchanges is brought out in the manner in which these two respond to marketwide shocks (Figures 2 and 3) and firm-specific shocks (Figures 4 to 7). We find that firm specific shocks are able to generate greater short-term volatility in price in NSE than in BSE. The marketwide shocks (shown by the impulse response functions) have lesser impact on NSE than on BSE. This would then imply that the types of trades are different across the exchanges. It is quite possible that one exchange could have more hedgers than the other while speculators might trade in the other market to a larger extent.

V
Conclusions

On the basis of the analysis in this paper the following broad conclusions can be made about the two national stock markets of India. First, there are well-defined relations between stock prices in the long run in each of these markets. Hence market segmentation is strongly ruled out. Second, the short-run behaviour of stock prices is such that no stock price can be considered to be independent of the others. Short-run price movements are mostly random or unstable, but the impulse response function analysis suggests that the instability does not persist for long. Finally, there seems to be a marked difference in the manner in which reaction in the two markets for the same stocks differ in terms of the responses to firm specific and market specific shocks. This may point to differences in the types of traders in these two exchanges.

[This paper has benefited from the comments of Ravi Anshuman, and participants at the 13th Congress of the European Economic Association (Berlin, August 1998). Sunila George provided valuable research assistance.]

Life Insurance in India

Emerging Issues

Ajit Ranade
Rajeev Ahuja

This article presents an overview of Life Insurance operations in India, and have identified the emerging strategic issues in light of liberalisation and the impending private sector entry into insurance. The need for private sector entry has been justified on the basis of enhancing the efficiency of operations, achieving a greater density and penetration of life insurance in the country, and for a greater mobilisation of long-term savings for long gestation infrastructure projects. In the wake of such coming competition, the LIC, with its 40 years of experience and wide reach, is in an advantageous position. However, unless it addresses strategic issues such as changing demography and demand for pensions, demand for a wider variety of products, and having greater freedom in its investments, LIC may find it difficult to adapt to liberalised scenario.

I
Introduction

INDIA has the highest number of life insurance policies in force and the total investible funds with the Life Insurance Corporation of India (LIC) are almost 8 per cent of GDP. The LIC employs more than one lakh employees who in turn supervise through 2,000 branch offices more than five lakh agents. Yet these numbers belie the fact that life insurance in India is spread very thinly and 'shallowly', and its role as a mobiliser of long-term savings is underdeveloped. Insurance companies in the developed world also sell products for old age income security in the form of pensions and annuities. The absence of pension coverage for a vast majority of Indians, also points to an important gap to be filled by the life insurance sector. In the 1990s however, LIC was put on its toes due to winds of liberalisation unleashed by the report of the committee on insurance reforms, and subsequent talk of allowing private entry into insurance sector. This has led to introduction of some new products and some innovations in customer service. But LIC largely remains a slow moving, over-staffed behemoth. For several decades now, it has sold overpriced and underpriced policies, and has tried to combine business objectives (being a corporation) and social objectives (being a state monopoly). There are big gaps in its product range which recent trends (described in section 6) along with liberalisation threaten to undermine its position. However, despite the usual public sector handicaps, LIC has the potential to turn its big size and reach to its decisive advantage in the wake of private sector entry into life insurance business.

In this article we present a comprehensive survey of life insurance in India. We also identify and analyse the strengths and weaknesses, and emerging policy issues in the operations of life insurance in India. For the sake of brevity and focus, we exclude from our analysis important policy issues such as whether foreign (and not just private) players should be allowed to enter the life insurance business, whether banks and other financial institutions also should be allowed to sell life insurance, what steps are needed for reforming the pension system in India, whether firms should be allowed to sell both life and non-life insurance products and so on.

The paper is organised as follows. In section II we present basic concepts in life insurance including a description of its role as a savings instrument. In this section we also review the recent macro-economic savings trend in the country. In section III we describe briefly the history of life insurance operations in India. In section IV we present a detailed description of the LIC, which is a state monopoly provider of life insurance, with a closer look at its performance in the 1990s. In section V we discuss various issues that are related to the liberalisation of life insurance in the country. To this end we provide some international data and examine its bearing on India's life insurance. In section VI we discuss the broader emerging issues in Indian life insurance in light of overall financial sector and demographic changes. Section VII concludes the paper.

II
What is Life Insurance?

The concept of insurance: Insurance is an arrangement to deal with unpleasant contingencies. It is a contractual arrangement which provides partial or total protection against adverse, typically financial outcomes. While there are many outcomes or risks which are insurable, there are many more against which there can be no insurance. Broadly insurance contracts can be divided into life and non-life insurance. Life insurance in particular provides protection to a household against the risk of premature death of its income earning member. In traditional societies such as India, the joint family system itself provided an insurance umbrella and succour to surviving family members.[1] In modern times such arrangements are now increasingly made through the market mechanism by 'buying insurance'. Thus, individuals pay a price (called the 'premium') to the insurance company for such a contractual arrangement, and the insurance company in turn, provides compensation if a specified event occurs. By making such contractual arrangements with a large number of individuals and organisations the insurance company can spread the risk. This gives insurance its 'social' characteristics, in the sense that it entails pooling of individual risks. Life insurance in modern times also provides protection against other life related risks, such as risk of longevity (i e, risk of outliving other sources of income) and risk of diseases and sickness (health insurance). The products that provide for longevity are pensions and annuities and are described in later sections.

Non-life insurance provides for protection against accidents, property damage, theft and other liabilities. Non-life insurance contracts are typically shorter in duration as compared to life insurance contracts.

Savings and premium: When an insurance contract is in operation between the insurer and insuree, the periodic payments made to the insurer (the premium) is the price paid for the service, i e, 'risk coverage'. When however the contract period is over a long time, as in the case of life insurance, premium payments have

two components. One goes toward 'buying' coverage and the other goes toward savings. This savings component of life insurance pits the insurer in direct competition with other financial institutions and savings instruments, such as bank deposits, equities and mutual funds. Since an increasing proportion of life insurance business involves pensions and annuities (insurance against 'old age') buying life insurance has elements of an investment decision.

The bundling together of risk coverage and savings is peculiar to life insurance, especially in developing economies.[2] A bank depositor can reclaim savings any time on 'demand'. In case of life insurance, the insuree cannot reclaim the savings component without some penalty. Such recall of the savings embodied in premium payments, amounts to cancelling or re-negotiating the insurance contract, and hence the penalty. There is thus a lock-in effect involved in signing insurance contracts.

The savings-linked life insurance contracts are pervasive. There are other short duration term life insurance contracts devoid of any savings component. The savings component, and the typically long-term nature of the contract, make life insurance an important instrument of mobilising funds required for long gestation and longer payback period investment projects. These are typically infrastructure projects which have high capital costs and low operating costs, substantial risks and sunk costs and high debt to equity ratio in their financing.[3] Substantial infrastructure investment is recognised as necessary for improving growth rates in developing countries such as India. In the next section we briefly examine the savings and investment trends in India and the role played by life insurance in it.

GDP and savings: Given the link between savings and premiums as explained above, any study of insurance business has to be seen in the context of all other savings activity of households. In a macro-economic sense the link between high growth rates and savings is well known from classical growth theory. In the context of India, Patel (1997) indicates that a growth rate of 8 per cent is possible only with a savings rate of 30 per cent. Gross savings in the economy is made of savings from the public sector, the private corporate sector and the household sector. In 1996-97 of the total gross domestic savings of Rs 3,338 billion (bln), the proportion contributed by the household sector was 78 per cent. Table 1 indicates of the trend of savings in the 1990s.

Household savings comprise of two components: (a) physical which includes land, gold, etc and (b) financial which includes bank deposits, life insurance, provident and pension funds, equities and debentures, small savings certificates and mutual funds. The composition of household savings has undergone a substantial change in the last two decades. In 1980-81 financial assets of households accounted for 39.4 per cent of household savings, going up to 63 per cent in 1993-94 and down to 45.3 per cent in 1995-96 and up again to 53 per cent in 1996-97. Household savings in financial assets have increased from Rs 86 bln in

1980-81 to Rs 404 bn in 1990-91 and then to Rs 972 bn in 1995-96. Within the category of financial assets, savings in life insurance were almost 10 per cent of total financial assets in 1980-81 and increased to 14 per cent in 1995-96 (see Table 2).

As seen from Table 2, insurance continues to be a significant part of household financial savings. While financial savings as a fraction of total household savings have gone up in the last decade, the fraction devoted to insurance has remained constant at almost 10 per cent of all financial savings. The total insurance funds raised every year in the country are made up of various components which includes life insurance, postal and state insurance (see Table 3). The breakup of insurance funds into various components is shown in Table 3 which also shows that the percentage of financial savings in life insurance has remained roughly at 10 per cent and percentage in provident funds and pension funds has declined from a high of 28 per cent in 1988-89 to 19 per cent in 1996-97.

Pension funds and LIC provide a significant source of investment funds to the government. A detailed description of LIC's investments is given in section IV. Suffice it to observe here that LIC's investment in central government securities account for 18 per cent of total central government securities. In case of state government securities, 12 per cent of it are held by LIC. Sectorwise distribution of LIC investments show that as high as 84 per cent go to the public sectors, around 13 per cent go to the private and the balance go to co-operative and joint sector.

III
A Brief History of Insurance in India

Life insurance activity in its modern form started in India in 1818 to provide for English widows. The first (Indian) life insurance company, the Bombay Mutual Life Assurance Society started its business in 1870. This was the first company that charged the same premium on both Indian and non-Indian lives. Earlier, native Indian lives were considered more risky and hence were charged a higher premium for coverage. Foreign insurance companies dominated in matters of insurance business in India and enjoyed near monopoly right upto the end of 19th century.[4] There existed a close association between the nationalist movement in India and the development of Indian insurance companies. There was a rapid growth of life insurance in India during 1920s and early 1930s.

Insurance regulation began formally in India through the passing of two acts, The Life Insurance Companies Act of 1912 and the Provident Fund Act of 1912. However, the first comprehensive legislation was introduced with the Insurance Act of 1938 that provided strict state control over insurance business in the country. This provided an effective check on large scale frauds that sullied insurance business during the 1930s.

After independence, the business of Indian insurance grew at a faster pace as competition amongst the Indian companies intensified and as the non-Indian insurers were dislodged by Indian life companies. Despite the strides by the Indian companies, insurance business remained an urban phenomenon. There was an immense scope for further spread of life insurance in the country. Moreover, this limited development was marked by many malpractices involving misuse of insurance funds, excessive costs, deficiencies and frequent liquidation of insurance companies. This shook public confidence and also deprived policy-holders of their savings and security.

LIC came into being in a scenario of insurance marred by insolvencies, increasing public distrust and mainly confined to urban areas.

The Life Insurance Corporation of India (LIC) was formed in 1956, when the government of India brought together over 200 odd private life insurers and provident societies, under one nationalised monopoly corporation. Another justification for nationalisation was to raise the much needed funds needed for rapid industrialisation and self-reliance in heavy industries, especially since the country had chosen the path of state planning for development. Insurance provided the means to mobilise household savings on a large scale. LIC thus came into being with a stated mission of mobilising savings for the development of the country and also conducting the business in the spirit of trusteeship and providing protection to the people in every part of the country. This latter emphasis on trusteeship was relevant then, in light of major insolvencies and fraudulent practices of some private insurance companies prior to 1956. Life insurance in India has also been sold, albeit on a much smaller scale, since the late 19th century[5] through the post office network. Postal life insurance is described in section VI.

IV
Life Insurance Corporation of India

LIC is more than 40 years old.[6] With more than one lakh employees, 2,000 odd branch offices, over 5 lakh active agents and more than 90,000 crore of investible funds, it is a big part of the nation's financial life. There has been a major social thrust to the activities of LIC, both at covering the poorer and vulnerable sections of Indian society through group schemes, and at investing the income in infrastructural and socially beneficent projects. Life insurance in India has spread over the years. This is reflected both in the growth in size of LIC and volume of business done by it. A snapshot view of the LIC operations around its birth and during 1996-97 is presented in Table 4.

Social role of LIC: One of the objectives of nationalisation of life insurance operations was to conduct the business with social objective in mind. Accordingly, there has been a major social thrust to the activities of LIC, both at covering the poorer and vulnerable sections of Indian society through group schemes, and at investing the income in infrastructure and socially oriented projects.

LIC is a public monopoly, owned wholly by the government of India. However, its charter specifies that only 5 per cent of its annual valuation surplus goes to the government (the owner) and the rest 95 per cent is returned to policy-holders in the form of bonuses and profits.[7] It is thus run almost like a mutual fund of the policy-holders. As seen from Table 8, LIC has generated surpluses consistently. This has bearing on the issue of actuarially unfair pricing. Thus, the so-called unfair pricing

results in surpluses, which are automatically returned to the policy-holders in the case of LIC.[8]

LIC's charter (the LIC Act of 1956) requires it to invest at least 75 per cent of its funds into socially oriented projects. As on March 1997, LIC invested Rs 61,074 crore in central, state and other government guaranteed marketable securities, and loans to various socially oriented schemes. These funds are used to provide for and improve basic amenities such as potable water, drainage, housing, electrification and transport. In 1997 the scope of socially oriented investment was widened to include infrastructure projects such as ports, roads, including highways, and railways.

LIC's other social role is seen in its subsidising specific kinds of policies. For the unorganised and rural sectors, group life insurance has an important role to play in supplementing other state level efforts, like providing old age pensions, employment generation scheme, preventive health and medical care. LIC's social security group insurance scheme that is applicable to 23 approved occupations including beedi rollers, rickshaw pullers, construction workers, self-employed women, covers around 50 lakh lives. Around six lakh lives are covered under rural group life insurance schemes (RGLIS) started from August 1995. At the time of nationalisation, insurance was largely an urban phenomenon but currently LIC underwrites 50 per cent of its new business from rural areas. All restrictions on other LIC investments (apart from the mandatory minimum 75 per cent) have been removed since June 1997. Mean returns on the LIC Fund has been increasing over the years.

Other related activities: In the 1970s LIC branched out into mass insurance through group insurance, later, extending to social security. It further entered the pension field in mid-1980s. During 1989-90, the corporation branched out into other related spheres of activity with the creation of three subsidiaries, viz, LIC Mutual Fund, LIC International, and LIC Housing Finance. Even though LIC has some limited foreign insurance business, and does reinsure with foreign organisations, its foreign activities have negligible foreign exchange Implications. LIC's initiative to provide related financial services through its extensive network of branches has come none too soon.

LIC's performance in the 1990s: The performance of LIC over 1990-91 to 1997-98 is given in Table 5 and Table 6. This information is culled from the various annual reports of LIC.

The debate on reforms in insurance sector has put some pressure on LIC to improve its performance. This is reflected in its overall performance in the 1990s. Its total premium income, around 90 per cent of which comes from individual insurance and the balance from group and annuity schemes, has grown at a compound annual growth rate (CAGR) of 19.6 per cent between 1990-91 and 1996-97. Likewise, the life fund grew at the rate of 20.7 per cent over this seven-year period. It stood at Rs 1,05,833 crore on March 31, 1998. Total premium income as well as life fund, both as a percentage of GDP have shown a steady increase, the former rising to 1.42 and the latter to 7.64 in the last year of the period under consideration (see Table 7).

Recent trends in premium income: Premium on new business individual insurance that comprised a third of the total premium income (new as well as renewal premium) declined to less than a quarter between 1990-91 and 1996-97. The growth rate of number of new policies, nearly half of which are written in rural areas currently, does not show any clear trend during the same period. Yet, total premium income from individual plans continued to grow at a reasonable rate. This is to a large extent due to greater preference for policies of higher sum assured. Share of policies with sum assured of Rs 50,000 and over increased from around 8 per cent in 1990-91 to 19 per cent in 1996-97. This share being picked up wholly at the expense of policies with sum assured of Rs 10,000 or less.

In the 1990s LIC introduced number of new products a few of them have been quite popular. This is reflected in the fact that the share of two most popular policies, namely, Endowment policy and Money Back policy, which constituted about 75 per cent of the business in 1991-92, has gone down to almost 56 per cent in 1996-97. Asha Deep, Bima Kiran, Jeevan Surabhi, introduced in the 1990s, did well in the market.

LIC's expenses: Overall expense as a percentage of premium income maintained a declining trend over the same period, though renewal expense as a percentage of premium income showed a steady increase from 3.52 to 7.1 during 1990-91 and 1996-97. Operating expenses, that include commissions as well as management expenses, as a percentage of total income (premium income as well as income from other sources) showed a steady decline over the period under consideration. In 1996-97, its share in total income was 14 per cent. Salaries account for much of the management expenses.

Net lapse, defined as lapses minus revivals, is the highest in the second year. That is, most policies that lapse, lapse

in the second year of its purchase. This ratio has increased over the 1990s. Ratio of outstanding claims to claims payable hovered between 5 per cent and 6 per cent.

The 'March' effect: Analysis of monthwise distribution of new business individual insurance suggests a consistent pattern year after year. The maximum business every year (around 33 per cent of the total number of policies) is done in the month of March, the month of financial closing, while less than 1 per cent of the total policies are written in the following month, that is, April. The new insurance business after plummeting in April, recovers to some extent in May and then gradually picks up till September, lowering somewhat during October, the festival season, and then starts rising again till December. It falls somewhat in January and February before peaking in March. This 'March Phenomenon' reflects the fact that awareness of the need for life insurance as a service is much limited, and most people buy life insurance more to avail tax benefits than to cover the financial risk faced by the family members from the death of the breadwinner. This observation that insurance purchases are tax induced has to be qualified since the country has only about 12 million tax-payers but almost 65 million policy-holders. Hence the extent to which tax incentives determine insurance purchases is limited.

Regional variations: Regional analysis of insurance, across seven zones in which LIC divides the country, suggests that insurance penetration (total premium income as percentage is of zonal domestic product (ZDP)) is maximum in the southern zone. This is followed by western and then south central zone while it is lowest is in central (Madhya Pradesh), and only a little better in north central (Utttar Pradesh) zone. There exists a strong correlation between per capita premium income and per capita zonal domestic product suggesting an increase in per capita income to be the surest way to increasing insurance penetration. Regionwise insurance density follows broadly similar pattern. However, number of policies as a percentage of population shows a strong correlation with social indicators such as regionwise literacy level. For example, top two regions (southern and western zones) according to literacy rate are also the regions having the highest number of policies as a percentage of its population. Similarly, the lowest two regions (north-central and central) in terms of literacy rate are also rank lowest in terms of number of policies as a percentage of its population.[9]

Effect of tax laws: As already mentioned in section IV, there is a significant impact of tax-incentives in the purchase of insurance. In this section we look at the tax treatment of the insurance company. Taxation of Insurance companies is governed by Income Tax Act 1961. Under this act, profits and gains of life insurance business is taken to be the surplus arrived at by way of actuarial valuation made as per Insurance Act, 1938. An assessee has to pay income tax at the rate of 12.5 per cent on his income from life insurance business. Further, Income Tax Act provides that any income of a fund set up by the LIC on or after August 1, 1996 under a pension scheme is exempt from income tax.[10] The amount that LIC paid to the government both on valuation surplus and the tax is shown in Table 8.

V
The Liberalisation Debate

The committee for insurance sector reforms: Liberalisation of the insurance sector commenced with the setting up of the insurance reforms committee by the government of India in 1993. Among other things the committee recommended [GOI 1994] that private insurers be allowed to co-exist along with government companies like LIC and General Insurance Corporation (GIC) companies. This recommendation had been prompted by several factors such as need for greater and deeper insurance coverage in the economy, and a much greater scale of mobilisation of (savings) funds from the economy for infrastructural development. Liberalisation of the insurance sector is at least partly driven by fiscal necessity of tapping the big reserve of savings in the economy. Its main recommendations are as follows:

(1) Raising the capital base of LIC from Rs 5 to 200 crore, half retained by the government and rest sold to the public.

(2) Restructuring of LIC involving delegation of financial, administrative and operational authority to the zonal offices. Central office should concentrate on policy formulation, product development, investments, personnel policies, and accounts of the corporation.

(3) Use of modern technology at all levels and development of effective management of information system

(4) Setting up of a strong and effective regulatory body with independent source for financing before allowing private companies into the sector, and

(5) limited number of private companies to be allowed in the sector. But no firm to be allowed to operate in both lines (life and non-life) of insurance. Minimum paid-up capital for a new entrant should be Rs 100 crore with promoters holding not exceeding 40 per cent and at no time be less than 26 per cent of the paid-up capital. Foreign companies required to float an Indian company for the purpose.

(6) Reducing mandated investment of fresh accretions from the present level of 75 per cent which is considered to be high.

The insurance regulatory authority (IRA) mentioned above, whose formation has to

precede the entry of private sector players in insurance, requires legislative action IRA has been formed but as of this writing, has not gained statutory status The following section discusses the proposed role of IRA briefly

The Role of the regulator Insurance sector liberalisation has to be seen as a part of the reform of overall financial sector The smooth functioning of the financial sector depends heavily on the continuation of the trust and confidence that people place on finance companies and financial products Since products such as insurance are basically a promise to pay these products are of little value to consumers if they cannot trust the company to keep its promise Furthermore, banking and insurance sectors are vulnerable to the 'bank run' syndrome, wherein even one insolvency can trigger panic among consumers The regulatory authority apart from its traditional functions must respect the need to ensure consumer confidence [11] In any other business some insolvencies can be seen as desirable since they are a normal process of weeding out of inefficient firms But in the financial sector one insolvency can potentially cause a domino effect wiping out an entire industry

The role of the proposed IRA can be seen as comprising the following three functions

(a) the protection of consumers interest this includes disclosure norms specifying mandatory products and risk standardisation also providing for quick dispute settlement

(b) to ensure financial soundness of the insurance industry this involves developing solvency indicators monitoring and auditing functions developing licensing and capital adequacy norms and penalties for violations

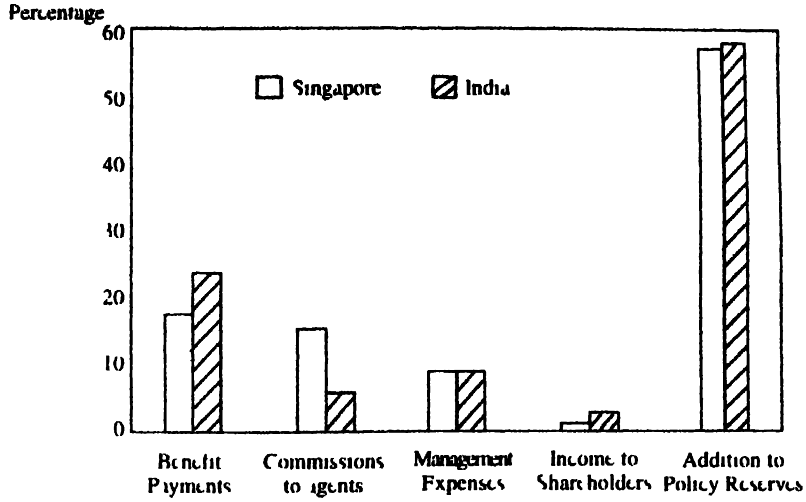
(c) to ensure healthy growth of the insurance market better education to consumers

(d) regulating insurance intermediaries such as agents brokers consultants and surveyors to evolve guidelines on the entry and functioning of such intermediaries

These objectives must be achieved with minimum government involvement and cost IRA's functioning can be financed by levying a small fee on the premium income of the insurers thus putting zero cost on the government and giving itself autonomy

IRA can also consider allowing banks to act as agents (as opposed to underwriters) of insurers in mass base types of products Given their wide network of branches and their customer base the banks can access

FIGURE INDIA (1995 96) AND SINGAPORE (1995) UTILISATION OF INCOMES



this market for insurance products and also earn commission income The incremental cost of providing such insurance products would be much lower Such a move of allowing banks to operate insurance business and vice versa is consistent with a worldwide trend of greater integration of banking and insurance

Treading with caution The move toward allowing private sector into insurance is motivated by prospective gains in efficiency product variety customer service and a general deepening of insurance operations in the country More importantly it will also ensure a greater mobilisation of funds required for infrastucture development However there have been some reservations expressed in allowing private entry on the following grounds (a) there would be a tendency for skimming the markets thus private players would concentrate on the lucrative mainly urban segment leaving the unprofitable segment to the incumbent LIC (b) without adequate regulation the funds generated may not be deployed in sectors which yield long term social benefits such as infrastructure and public goods similarly without regulation private firms may renege on their social sector investment (and possibly co insurance) obligations Meeting these concerns[12] requires a strong regulatory body

Another cautionary note is expressed in estimating the potential size of the market for life insurance products The current focus seems to be mainly on the non agricultural mainly urban and middle class sector which it can be argued has been adequately targeted by LIC The biggest growth area is rural agricultural sector wherein it is not clear whether new private entrants would have any competitive edge over LIC This is an area where unconventional and innovative marketing strategies would have to be used to reach the target population

Benchmarks from abroad Insurance density defined as premium per capita, is one of the commonly used statistics for comparing the spread of insurance across countries Such a measure is not appropriate for several reasons Briefly these are

(a) different countries have vastly different aggregate incomes thus to the extent that life insurance is a normal good, its demand is likely to be higher in more affluent countries

(b) the distribution of income varies substantially across countries thus even controlling for aggregate income a country with a more skewed distribution is likely to have lower per capita demand for insurance

(c) tax treatment of insurance and hence incentives to buy life insurance differ markedly across countries

(d) degree of development of alternative financial markets and instruments may be different across countries for example, the *Economist* magazine [*Economist* 1997b] cites that in South Africa since bank deposits earn a negative real rate of return the assets of insurance companies as a fraction of GDP is second highest in the world, next only to Japan

Given this comparisons across countries are only indicative Less than 7 per cent of the population in India has life insurance covered In Singapore around 45 per cent of the people are covered and in Japan this is close to 100 per cent In the US over 81 per cent of the households have insurance covered [13] India has the biggest life insurance sector in the world if we go by the number of policies sold, but the number of policies sold per 100 persons is very low (see Table 9) However, this obser-

vation has to be qualified by noting that insurance is typically spread very thinly among rural agricultural population, which constitutes a negligible proportion in the developed countries, whereas it is amlost 67 per cent of India's population.

But total life premiums collected per annum, was only 1.4 per cent of Gross Domestic Product in 1996-97. This measures market penetration of insurance within any country. In Singapore this figure was about 2.3 per cent in 1995, for Japan it was 6.3 per cent, and for South Korea the rate was about 9.8 per cent. Since Indian insurance collection is a tiny share in the world life insurance premium collection, and it is itself a small proportion of India's GDP, it means that the average premium collected per policy is very low. The market share of world life insurance premiums is topped by Japan (30 per cent), followed by USA and then by UK. The share of all developing countries is a meagre 2.5 per cent. Similarly, the amount of premium collected per capita too is very small compared to developed countries or even some of the fast growing developing countries (see Table 10).

The major insurance markets in south and east Asia are in varying degrees open. These range from comparative free markets of Hong Kong and Singapore to the increasingly more liberal markets of South Korea and Taiwan to a more densely regulated insurance sectors of Thailand and Malaysia. Opening up of insurance sector is an integral part of the liberalisation process being pursued by many developing countries. Since 1987, when Korean and Taiwanese insurance sectors were liberalised, the Korean market has grown three times faster than GDP and in Taiwan the rate of growth has been almost four times that of its GDP. Philippines opened up its insurance sector in 1992.

The industry structure shows a high concentration in life insurance business in many countries. Even though there are more than 1,200 active life insurance companies in the US, the 10 largest life insurance companies hold 43 per cent of total industry assets in 1990. The market share of 10 largest companies in terms of premium is 53 per cent in case of Australia, 72 per cent in Philippines and 90 per cent in case of Singapore.

The claim settlement ratio of LIC, defined as percentage of claims settled out of total submitted is probably the highest in the world.

Utilisation of income comparison: India and Singapore: Figure shows the pattern of income utilisation between India and Singapore. The major difference reflected in the two charts is in the benefit payments and the commissions paid to the agents. Generally, commissions paid to agents are higher wherever the insurance industry is competitive. This is also the case in Singapore. While commissions to LIC agents in India form only 5 per cent of the income, its share in Singapore is 16 per cent. In Malaysia share of commissions is close to 20 per cent. The benefit payment to the policy-holders in India is much higher as compared to what policy-holder gets in Singapore. This is because of the mutual fund nature of LIC, wherein valuations surpluses flow back to policy-holders. Much of benefit payments to the policy-holders go in the form of maturity claims. Its share in total benefit payments in India was about 70 per cent whereas in Singapore it was just 50 per cent. Another important difference is with respect surrenders. Surrenders form 25 per cent of the benefit payments in Singapore whereas it's share in India is just about 9 per cent.[14]

VI
Emerging Issues

The demand for life insurance has two sources, viz, the risk of premature death and the risk of longevity. The respective products which cover these two types of risks are term insurance (where the term can be long), and pensions or annuities. The market for annuities in India is almost non-existent, and LIC coverage is also very small. The usual products offered by LIC bundle savings and term insurance. In the following sections we discuss the prospects for life insurance in India from both these sources.

Demographic trends: Two relatively modern trends in the Indian context affect life insurance business significantly. One is the breakup of the joint family system which worked like an insurance arrangement. With more and more nuclear families becoming the rule, there is a greater demand for life insurance cover for the breadwinner of the family. The second trend, also connected with the first one, is that the elderly are increasingly having to fend for themselves. In 1990 India had about 54 million people above the age of 60. This number is expected to rise to 71 million by 2000, and to almost 10 per cent of the total population by 2010. Thus future senior citizens look to plan for their own old age, rather than be a burden to their children. There is a greater awareness of planning for old age, and the need for pensions and annuities. These two trends portend a large and growing market for life insurance in India.[15] Some other factors which are catalysing these developments is the increase in the size of India's middle class, rising per capita incomes and rising literacy.[16] With an estimated size of 250 million, the middle class is at least four times as large as the current coverage of LIC. Other developments are above 6 per cent growth rate of the economy which translates into higher savings, and a proliferation of savings instruments, an economically liberalised atmosphere, greater consumer awareness and level of education about insurance.

Demand for pension plans: In much of the developed world, pension funds represent an important form of financial assets in the economy. For example in the US economy in 1992, pensions accounted for 36 per cent of all financial assets, behind banks with 46 per cent. There are important conceptual issues surrounding the provision, funding and management of pension funds, which we do not discuss in this paper.[17] For example, it is now recognised that the state cannot be the sole provider of old age income, nor is it advisable to leave pensions completely in the private arena. In India however, except for the organised sector employees, for much of the labour force, including the self-employed, there is hardly any social security in the form of old age pension. Out of an estimated 340 million people in the labour force, less than 30 million are covered by any old age income security, including pensions (for mainly central government employees), employees' provident fund and public provident fund. The biggest single group of persons not covered by any old age income security is agricultural labour.

There are at present basically three forms of old age income security, viz, provident fund, gratuity and pensions. Employees' Provident Fund Scheme (EPFS) of 1952 is the largest of all provident fund schemes, covering almost 20 million employees in the organised sector and having a corpus of over Rs 800 billion. The fund which is administered by a central board of trustees (CBT), is severely regulated in terms of investment options. Other provident fund schemes are Coal Mines Provident Fund Scheme, Central Government Employees' Group Insurance Scheme, and Public Provident Scheme. Some provident funds are exempted from the EPFS law (usually large corporations), and are managed by their own trustees funds (though subject to identical investment norms) and amount to about Rs 250 billion.

Under the gratuity scheme received on retirement, death or resignation, benefits are paid according to Payment of Gratuity

Act, 1972. The cost of gratuity is entirely borne by the employer and is paid on cash basis or funded by the employer during the service period of an employee. The fund so formed is administered by a trust or contributions are paid to LIC under its Group Gratuity Scheme. The estimated corpus in the Gratuity fund is about Rs 250 billion.

The third form of social security that is currently prevalent is pensions. Central government employees, including those in military service are covered by pensions which are indexed to the cost of living. LIC also provides pension schemes but the premium amount it receives from such schemes forms only a very small part of its total premium income. Institutions that have arrangements for payment of pension to their employees can either set up an internal fund, and purchase an appropriate life annuity only from LIC as and when an employee retires or purchase a group pension policy from LIC. This monopoly of LIC in providing annuities for employers with private pension arrangements was relaxed in 1997, when UTI was also allowed to sell annuities.

The lack of growth of pension plans in India is due to a combination of inadequate tax relief for pension funds combined with strict investment restrictions that yield low returns. Furthermore the virtual monopoly of LIC, whose lack of innovation and marketing in this respect, has ensured that pensions remain very undeveloped in India. In other countries such as Singapore the resources of the central provident fund to GDP was 76 per cent in 1990, in Malaysia it was 41 per cent. In South Africa the assets of pension funds and insurance companies was as high as 84 per cent of GNP in 1990. In developed countries like Switzerland and Netherlands the assets of pension funds and life insurance companies to GNP was 110 and 107 per cent respectively in 1990. In US and UK, pension fund is 66.7 and 54 per cent of GDP respectively. In Chile, in 1994, pension fund was 43 per cent of GDP.

Investment pattern in the allocation of pension funds also varies greatly across countries. While in UK, pension funds invest 72 per cent of their resources in real assets, that is, equities and real estate, and the remaining in debt instruments, in the US it is 46 and 54 per cent respectively. Swiss and Dutch invest, respectively, 33 and 31 per cent of their pension fund in real assets. In developing countries such as Singapore and Malaysia most of these funds are placed in government bonds and other debt instruments. Chile, much talked about country for its pension reforms, currently invests around 30 per cent of its pension funds in equities.

Another reason for the lack of popularity of pensions in India, as Insurance Reforms Committee also pointed out, is tax relief given to contributions to the pension/annuity is much less in India than in UK. Another tax anomaly that needs to be corrected is the asymmetric treatment of LIC *vis a vis* employer funded pensions.

The pension system in India needs substantial reform, with one of the main objective being to bring a large section of the workforce under the pension umbrella in a fiscally sustainable manner. Other policy issue concerns whether participation in pension system be compulsory or voluntary, and what kind of regulatory oversight is necessary for private sector pension fund management.[18]

Competition with other savings assets: As mentioned earlier in this article, the bundling of savings and insurance is peculiar to life insurance. As the financial sector develops and there is a wide range of financial products to choose from, the attractiveness of using life insurance contracts as partly a savings instrument depends on the rate of return. This in turn is determined by the freedom available to LIC on deciding on an optimum mix for its investment portfolio. Severe restrictions, such as government mandated investments would mean that its ability to offer higher returns on the savings component would be limited. It is seen that in developed economies there is considerable separation between insurance and savings products, and as such a wide range of insurance-only products called term insurance products are sold. Even among savings linked products, there is a wide variety with scope for customer specified savings share, and also inflation indexed (variable) returns. In the current regime the process of introducing new products in LIC is very slow and constrained, and this will need revamping.

Issues in Pricing: LIC is a corporation wholly owned by the government. However 95 per cent of its excess earnings are returned to the policy-holders, who hold 'with-profit' policies. Thus *de facto* operation is akin to a mutual fund. Hence the issue of actuarily unfair pricing, does not arise, since any excessive pricing that results in excess income for the company is ploughed back to its policy-holders (who, it must be added are not shareholders). In doing so, there is an element of cross-subsidising that goes on, in the sense that the 'with-profit' policy-holders gain at the expense of (the minority) policy-holders who do not have with-profit policies. In the event that LIC becomes a true common stock company, correct pricing may become essential. There will emerge an important issue of addressing the interests of shareholders (who would want higher profits) and policy-holders, customers who would demand actuarily fair pricing. Moreover, in such a scenario, cross-subsidising across products will no longer be feasible.

Role of information technology: The business of selling life insurance requires assessing the profile of the customer and assigning the right policy. This process is facilitated by a database that is created in the course of a corporation's operations. With its huge network, LIC has a tremendous incumbent's advantage in being able to generate such a database. This business is completely driven by information technology, which can result in substantial productivity gains. LIC is a unique organisation involved in the selling of essentially one product on a massive scale. If it uses this network to offer other financial products such as pension plans, other long and short term savings instruments, various term insurance, it would have better utilised this vastly underutilised capacity.

Selling of Life Insurance through the postal network: The department of posts and telegraphs also provides some banking and insurance functions. Notable among these are the post office savings bank (POSB)[19] and postal life insurance (PLI).

PLI came into being on February 1, 1884 as a welfare measure for government employees. The scope of PLI was extended from time to time to other categories of employees. PLI benefits now extends to the employees of central and state governments, central and state public sector undertakings including banks, universities, local bodies and defence services. In 1994-95, PLI had around 21 lakh policies for the total sum assured of Rs 4,776 crore. PLI has a very low expense ratio.

The strategic advantage of an existing network of 1.5 lakh branches of the postal system can hardly be overemphasised. It is well known that the postal savings schemes generate much more deposits than rest of the banking sector. A strategic alliance between LIC and the department of posts for life insurance and other related products can lead to greater penetration as far as life insurance is concerned.

VII
Conclusion

In this article we have presented an overview of life insurance operations in India, and have identified the emerging strategic issues in light of liberalisation

and the impending private sector entry into insurance. The need for private sector entry has been justified on the basis of enhancing the efficiency of operations, achieving a greater density and penetration of life insurance in the country, and for a greater mobilisation of long-term savings for long gestation infrastructure projects. Introducing competition involves several regulatory issues and the role of the regulator has also been discussed here. In the wake of such coming competition, the government monopoly of LIC is a strong incumbent, and is in a position to take advantage of its wide reach and more than 40 years of experience. However, unless it specifically addresses the strategic issues such as changing demography and demand for pensions, demand for a wider variety of products including the delinking of savings and insurance, and having greater freedom in its investments, LIC may find it difficult to adapt to the liberalised scenario.

Notes

1 A simple mathematical device that explains why joint families would require less market insurance could be as follows. Imagine a joint family household of n earning individuals, whose income generation is given by independently (and say identically) fluctuating random variables x1 to xn The per capita income of this household is (x1 + x2 + .. + xn)/n which is much more stable (less variance) than all the individual x's. When such a household breaks up into n households, there is increased risk (greater variance) and hence a greater need to buy market insurance.

2 The implication of bundling insurance and saving into one contract is studied in Ahuja (1998)

3 The India Infrastructure Report (GOI 1996) estimates that the funds required for infrastructure investment could be in excess of US$ 100 billion over the next few decades.

4 Postal life insurance (PLI) came into being on February 1, 1884 as a welfare measure for government employees. The scope of PLI was extended from time to time to other categories of employees

5 For detailed historical account of life insurance in India and the Life Insurance Corporation see LIC (1970) and LIC (1991).

6 LIC's age of 40 is an appropriate milestone for introspection. George Bernard Shaw said that by 40 one is either a fool or a philosopher. As the LIC enters its fifth decade, its conduct can hardly be described as foolish. Indeed, it shows maturity and perhaps some introspection, but it is not guilty of being excessively philosophical. But of course, Shaw's quip was about people, not corporations

7 It should be mentioned that the LIC does not pay any explicit 'guarantee fee' to the government of India, which stands as guarantor to all policy-holders The five per cent rule may be seen as a proxy guarantee fee, although this interpretation is controversial, especially in light of severe government restrictions on LIC's investments

8 The returning of 95 per cent surpluses to policy-holders has distortionary effect in that, the 'with profit' policy-holders get cross subsidised by the 'without profit' policy-holders.

9 Outreville (1994) studies the relationship of various parameters such as literacy and incomes in a study of insurance in developing countries and reaches similar conclusions.

10 For some details on tax treatment of insurance in various countries including India see Soman (1997).

11 For more details on the role of the regulator see Ranade and Ahuja (1996b).

12 Some of these concerns have been analysed in Ranade and Ahuja (1996a) and Chitale (1997).

13 A detailed analysis of the US insurance industry is found in Wright (1992).

14 For more details on the Singapore life insurance business see Annual Report of the Insurance Commissioner (1995) and Lian (1996).

15 While the growth rates of premiums in developed countries are barely 5 per cent, in many developing countries the growth rate is almost 20 per cent (see Table 11).

16 See Outreville (1994) for an analysis of cross country experience of life insurance.

17 For some discussion of pension reforms, see Patel (1997) and Vittas (1995a and 1995c), and references therein.

18 The Insurance Reforms Committee, among other things, recommended greater freedom for investment of pension funds, exemption from taxes, and introduction of unit linked pension plans.

19 The banking activities of the post office is gauged by the fact that the POSB has a network of around 1.5 lakh post offices as on March 31, 1995, with an outstanding balance during 1994-95 through various savings schemes of Rs 78,908 crore. Mahila Samridhi Yojana scheme introduced in October 1993, in order to empower adult rural women financially, has generated Rs 81.2 crore in 84.4 lakh accounts as on March 31, 1995. During 1995-96, the department introduced many new value added schemes such as premium savings bank service in order to facilitate better access to cash to the account holders.

Risks of Capital Account Convertibility

R H Patil

The experience of the east Asian countries has underscored the dangers of unregulated capital mobility so long as a country does not have the institutions to handle these flows efficiently.

ON the international trade front significant liberalisation has taken place during the post-war period. Quantitative as also tariff restrictions have come down dramatically during this period. As a result of its success the GATT got promoted into WTO which now encompasses trade in both commodities and services. In comparison to the tremendous strides achieved in the field of trade liberalisation, the progress on the IMF front appears to be relatively less spectacular despite the fact that a large number of its member countries have accepted full current accounts convertibility.

Although it is not in its original mandate that it should be working towards an eventual totally free capital mobility regime, the IMF during the last couple of years has been arguing in favour of a world that has dismantled national controls on capital movements. At the annual IMF-World Bank meeting held in 1997 at Hong Kong many spokespersons from the IMF and the World Bank had argued in favour of free mobility of capital across national borders. But at the recent annual meeting of the IMF-World Bank in 1998 at Washington the mood was quite different. Having seen the devastation caused by greater capital mobility, especially in east Asia, there was much less of a fervent appeal to move towards an era of capital accounts convertibility. Thus the earlier euphoria about the need for abolishing all controls on movement of capital across national borders is waning rapidly.

Logic of Capital Mobility

We need not dismiss the earlier plea of IMF in favour of capital mobility across national borders as being one more evidence of its policies being subjected to pressures from the developed western world and in particular the US which almost sets the tone of IMF policies in all important areas. A highly simplistic and uncharitable explanation for IMF's support of free capital flow to and from the middle income and developing countries may be that IMF is keen to facilitate greater control of MNCs on the productive resources of these countries. However, a more plausible reason for IMF's tilt towards capital mobility appears to be that unfettered capital mobility is perhaps as important and beneficial as free trade in goods and services.

During the last two decades different versions of free market economy have become popular in many parts of the world as government as an entity has failed to be equal to the promises it placed before the common citizen. The collapse of the communist regimes in the erstwhile USSR and the embrace of market economy by China and most of the east European countries have helped in increasing the attractiveness of the market economy approach in many other areas including international capital mobility. Although the extreme versions of the free market philosophy are rapidly going out of fashion, many sensible people are convinced or believe that the government as an entity has proved to be not as efficient as the market in allocating resources in several areas of economic activities. On a purely logical plane one can still argue persuasively that more efficiently run governments are better allocators of capital than the free markets. However, in real life situations neither totalitarian nor democratic regimes have been able to ensure emergence and continuity of efficiently run governments. It is primarily for this reason that market-oriented solutions are becoming increasingly popular in several parts of the world.

Ascendance of Market Economy

Along with introduction of many market-oriented domestic reforms several countries are granting freer access to inflow of international capital. One of the major attractions in adopting this policy is the access a country could have to the vast and growing pool of savings in the developed countries which have not been able to throw up enough opportunities for investments within their own borders. According to some estimates, the global tradable stock of financial assets including bonds and equities was well over $ 41 trillion as at end 1994. The stock of liquid financial assets is estimated to be expanding at about three times the rate of growth of the global real economy. In the developed world, since the stock of liquidity is growing very much more rapidly than the GDP, the major problem faced by the fund managers and the financial intermediaries like banks in these countries is one of deploying the funds efficiently at attractive rates. Although only a small part of the incremental pool of liquid capital is in search of better avenues of investments outside the developed economies, this pool is large enough for other countries that are willing to welcome the inflow of such capital.

The proposition that seems to have attracted the world bodies like IMF and IBRD is the tremendous benefit that the capital importing countries could derive by propelling their growth process. A regime of free capital mobility would simply mean flow of savings from a region where they are surplus to a region where they are in deficit. This point is of particular significance for two reasons. The concessional assistance from the multilateral institutions as also bilaterally from the rich countries is drying up fast. The affluent world has developed aid fatigue and as a result its propensity to direct assistance to several developing countries is either stagnating or declining continually. Unfortunately, the efficiency of aid utilisation has also declined very sharply in the developing countries because of the fact that most of the official assistance is directly given to the governments or governmental agencies which are noted to be universally inefficient in aid utilisation. This has also been one of the contributory reasons for the developed countries to turn away from extending official assistance to developing countries.

In most parts of the developing world it has been observed that the private sector has been able to utilise capital more efficiently than the public sector. The relative efficiency of the private sector in relation to that of the public sector is not necessarily across nations but within the boundaries of any one country. Despite all the handicaps from which the private sector may suffer it is able to utilise resources more efficiently for the simple reason that it cannot hope to get budgetary support to remain a going concern or viable indefinitely.

Importance of Commodity Sectors

Despite all the opening up of the world economy through continual trade liberalisation the proportion of aggregate global GDP entering into international trade cannot expand beyond certain

limits. It needs to be noted that the major part of the global income will continue to be generated locally in each country. It has been noted that on an average about 80 per cent of the global economy owes its existence to locally produced and consumed goods and services like retailing, public utilities, transport, food processing financial services, health care, etc.

In the early stages of development of most countries, the commodity sectors contribute a significantly large part of GDP. It is only at an advanced stage of economic development that the proportion of income contributed by the services sectors like financial services, education, law and order administration and information technology (all of which can be called as the non-commodity sectors) comes to account for a growing share of the GDP. Consequently, as a country reaches a mature stage of development the share of the GDP contributed by the commodity sectors (both manufacturing and agriculture) declines

It is for this reason that in the early stages of their development the developing countries require large amount of investible resources for investing in the commodity sectors and the input-intensive infrastructure sectors like power, road transport, ports, etc. If a country desires to grow at a rapid rate it needs large investible resources which only the developed countries that have surplus capital can provide. The policy framework of developing countries desiring to grow faster needs to facilitate inflow of foreign capital particularly into the commodity sectors (including such commercially viable infrastructures areas as power and telecommunication).

Capital Mobility

Flows of capital into developing countries are generally of three types, viz, portfolio equity, direct investment (with majority control) and loan capital (both long-term and short-term). These different types of foreign capital flows have varying impact on balance of payments, financial sector and the capital markets of the host country. The portfolio capital which comes by way of investments in equities and bonds floated on the market adds to the financial liquidity of the host country. Generally, annual limits are placed on the inflow of such portfolio investment by most countries to tackle the problem of destabilising flows. Foreign portfolio investors generally enjoy freedom in regard to entry and exit from the host country. Foreign investors' investment decisions are influenced by their risk-reward perception of the host country and the specific instruments in which they invest. It has been observed that portfolio capital is fickle and is subject to sudden outflows if market conditions in the host country turn adverse. Loan capital inflows materialise when the domestic entities (whether owned by the citizens or by foreign investors) decide to raise funds from abroad. These decisions are influenced by the costs of funds at home in relation to those from foreign sources. In many countries permission from the concerned authorities may be required regarding the quantum and maturity terms of such loans. A number of countries including India place separate annual limits on short- and long-term loans that all the domestic entities can borrow in each year.

Among the three forms of foreign capital inflows the direct investment inflows are noted to be generally stable and a long-term nature. Such investment inflows are influenced by long-term country-cum-industry rates of returns. Since such capital inflows are in 'real economic activities' of the host country the investors are fully aware that the actual rates of return materialise only after the investment proposals fructify and start yielding after their gestation periods.

Direct investment flows are governed primarily by long-term return considerations and are therefore much less volatile. Direct investments also do not have the destablising impact which the hot money type portfolio investments have. Countries keen for integrating their economies into the global economy should therefore be more inclined, in the early stages of their development, to welcome direct investment before they ever open up their capital accounts to foreign investors.

Recent East Asian Experience

When countries decide to throw their doors open for inflow of foreign capital it has been observed that during the early years it is the portfolio type of foreign capital that floods in. In any case the inflow of capital in the form of bilateral official or multilateral assistance does not increase merely because a country has decided to remove barriers against inflow of foreign capital. The level of official aid inflows is mainly influenced by the nature of existing international relationships that any country cultivates over time. Further, the foreign direct capital inflows take time to fructify as potential investors have to identify bankable projects, local joint venture partners (where found necessary) and receipt of various approvals of the host government authorities. Portfolio capital on the other hand is more mobile and can get into the country through the stock exchange route, etc. In this context it would be highly rewarding to draw lessons from the recent experience of the east Asian countries (EACs) that are passing through a very difficult phase since mid-1997. It appears that major source of the trouble these countries are now facing has been due to their highly liberal approach to foreign capital

The experience of the EACs is particularly interesting because of the fact that only a few years ago these countries were hailed as models particularly for the developing countries that are keen to have rapid economic development. Before the EACs received massive inflows of foreign capital they had undergone an interesting phase of macro-economic reforms during the mid-1980s. A crucial component of the reform process in these countries included a real exchange rate target that was designed to achieve strong export competitiveness. Given their size and resource endowments EACs are obliged to adopt an export-led growth strategy. They introduced structural reforms to stimulate rapid growth of tradable goods. On the exchange rate side they adopted policies that led to continual devaluation of currencies that more than compensated relative levels of domestic inflation. Simultaneously, they maintained strict fiscal discipline to eventually achieve budgetary surplus. As a result public sector debt to GDP ratios fell in almost all these countries.

The combined impact of the depreciating effective exchange rate and tight fiscal policy led to relative price stability thereby enhancing the attractiveness of the EACs for foreign investors. During the end of 1980s and up to the middle of the current decade they were able to attract sizeable inflows of foreign capital. During the early years when the capital inflows grew year after year these countries had a comfortable time as the large capital inflows gave them considerable latitude in their policy formulation. Since these countries already had very high savings rates the available funds for investment grew rapidly because of the large inflows of foreign capital. This phenomenon lulled these countries to adopt policies which did not encourage more efficient use of capital. Many investors did not bother to give due attention to such important aspects as prudent asset liability management strategies. In short, the EACs did not effectively meet the major challenges especially posed by the large inflows of foreign portfolio capital.

The experience of the EACs abundantly proves that unless a host country's institutional structure, regulatory policy framework and capital market efficiency are sufficiently strong, it will face serious difficulties in integrating itself with global financial markets. It has now become obvious that most of the EACs were just not well prepared to face the problems that global economic integration posed to them. The series of economic policy reforms introduced by these countries in cleaning up their markets and institutions were no doubt in the right direction. But a high level of preparedness was needed on several other fronts before the whole economy was ready to absorb the shocks that entrants into the global economic system usually are subjected to in the transitional phase.

Financial Sector Weaknesses

Among all the various sets of factors that have led to the major crisis being faced by the EACs, one major area in respect of which these countries were relatively more vulnerable relates to the weakness that are observed in respect of their financial sector. The problems faced by the financial sector get compounded if there are also weak unsound non-bank financial companies (NBFCs) that compete with the rest of the financial sector entities.

Like in India the EACs also had their own versions of tightly regulated regimes with many of these countries having directed lending for some of the sectors accompanied by subsidised lending rates. They used to tightly regulate entry of new banking institutions as also expansion of the existing ones. They also used to control lending and deposit rates. After this tightly regulated system was dismantled by the EACs their banks lost the high degree of comfort they had enjoyed in the past. In some sense the banks lost a great deal as their franchise value declined with the ushering in of a free competitive regime. Since deregulation was brought about speedily the degree of competition to the banks from other players increased significantly. Competition to the banks also increased from newly set up banks, expansion of branches by the existing banks as also from the NBFCs. Banks lost good business with domestic borrowers getting freedom to borrow directly from overseas financial centres. Attracted by lower interest rates the better credit rated customers started moving away from domestic banks to foreign currency loans from international financial centres. Consequently, the portfolio quality of local banks deteriorated considerably as the proportion of loans to the smaller and less creditworthy customers in the total portfolio increased.

The banks and the NBFCs were not well prepared to face intense competition for another reason. Before introducing deregulation the authorities in these countries had done a cleaning up job. In regard to the banks and the NBFCs, these countries had faced a financial crisis earlier. To meet the situation a number of bail-outs were worked out for both banks and NBFCs. But all bail-out attempts always create moral hazard problem. Whenever bail-outs are carried out the culprit managements should be punished. Invariably this was not done in the EACs perhaps partly for the reason that the primary cause for the financial crisis was the authorities themselves who worked out the bail-out later. Such things do happen in a regime of directed and behest lending. But in any case it would have been appropriate to restructure the managements of the bailed-out institutions and banks so that new managements have the required skills for facing a competitive situation more effectively. Secondly, another serious problem faced by the financial sector was that the process of bail-out and restructuring was not carried to its conclusion by strengthening the capital base of the banks and NBFCs. Since a rapid transition to a deregulated regime puts considerable pressure on the local banks and institutions their capital base should be much higher than what is usually prescribed by the

well-known international norms about capital adequacy.

Risks of Foreign Portfolio Capital

Since the foreign portfolio capital is the fastest to respond to any policy changes its flow invariably is significantly higher during the early years soon after capital controls are removed. The EACs were no exception to this. Large amounts of money flowed into these countries through the stock exchange route. In the early years fund managers were cautious to place their investment after proper equity research analysis. But once money starts flowing into the market in a big way the mechanism of self-fulfilling prophecies starts working. This attracts more investments and the fund managers get thrilled as the NAV of their portfolio starts increasing. After some time fund managers become complacent and the quality of their due diligence declines. This leads to a situation of bubbles and bursts.

The advantages of interest rate arbitrage also encouraged a large inflow of loan capital into the EACs. Since all these countries managed 'dirty floats' (that is by managing their exchange rates within well defined bands) banks as also other borrowers raised low interest foreign currency loans, converted these into domestic currency for on-lending them to the local entities at higher rates. The bulk of such borrowed money was of a short-term nature. Given the real estate boom in these countries a large proportion of this was lent to/invested in real estate. But as the crisis developed all the foreign currency borrowers faced serious problem soon after the unsustainable property boom turned into a burst. When the lenders started recalling their loans or stopped renewing the maturing loans there was a near panic in the foreign exchange markets. It is mainly for this reason that currencies of these countries depreciated sharply which many keen observers of the scene have described as being an over-reaction or over-correction.

Role of Hedge Funds

Since the breakdown of the Bretton Woods system world financial markets have become increasingly volatile. The daily turnover in the foreign currency markets is estimated to be around \$ 1,300 billion. It means that currency trade is several multiples of the underlying real global economy that is subject to cross border flows. No individual country is in a position to face the onslaught of large speculative flows against its currency. Whenever the market perceives that the parity of a currency is out of alignment with its fundamentals there will be speculative attacks against that currency. Since most of the currency traders are still not unanimous as to which factors determine external parity of a currency it is possible that unhealthy speculation may result in the currency of a country that is coming under pressure. Assessment of right level of a currency is still an art and therefore there could be wrong judgments.

One may argue that those who guess wrongly will be punished by the market. But recent history has shown that speculators are willing to suffer such losses once in a while if they are able to guess correctly in a majority of the cases. A new breed of speculators has emerged during the last decade who take big speculative bets. These new breed of speculators are the hedge funds who have come under close scrutiny after the debacle of the much publicised hedge fund called long term capital management (LTCM). The activities of hedge funds are unpredictable. They operate secretively and do not provide meaningful information about their operations even to the investors who provide them funds. The hedge funds often behave as predators, always in search of an attractive and weak prey. Hedge funds move their funds from one country to the other with tremendous speed in search of profits or to minimise their losses in the host country.

Hedge funds normally try to derive maximum benefit from market imperfections that provide a type of 'arbitrage opportunities'. They continually trade in currencies or financial assets globally to derive maximum benefit from the real or perceived mispricings. There is a major qualitative difference between mutual funds which are tightly regulated in their home countries even when they invest their funds globally and hedge funds which are least governed. The mutual funds raise monies from innumerable investors whose interests the regulators are keen to protect. The hedge funds raise resources from relatively wealthy investors who are better informed or are willing to risk their resources with the hedge funds which generally adopt risky investment strategies. A number of hedge funds speculate in exchange rates of countries which they perceive to be vulnerable. George Soros made over a billion dollars by speculating in the exchange parity of the pound sterling. Hedge funds are therefore generally viewed with distrust by most of the developing countries. The Malaysian prime minister, Mahathir Mohammed, is very bitter about the hedge funds because of the havoc played by them with the Malaysian economy.

The danger from the hedge funds is not so much because of the funds they raise from investors but the very high leverage with which they play their game. LTCM got into serious difficulties because it had balance sheet exposure of well over \$ 100 billion on own funds of less than \$ 4 billion. Over and above this its off-balance sheet exposure in the from of derivative instruments was close to \$ 1,000 billion. LTCM had borrowed from some of the world's top commercial and investment banks.

The destabilising role played by the hedge funds recently once again came to light when the Japanese yen came under the attack of the hedge funds. It is largely because of the onslaught of the hedge funds that many were predicting a large depreciation of the yen to 180 yen per US dollar by early March 1999 These experts were in for a rude shock when the hedge funds could not sustain the costs they were incurring in their operations and were forced to unwind their positions. The yen, which had depreciated to 147 per US dollar at one stage has risen sharply to its current level of 116 yen to the dollar. While it may be true that many hedge funds may have incurred losses in their speculative attack on the Japanese yen, they stand to gain substantial amounts whenever they gang up against currencies of several other countries. One should not overlook the damage the hedge funds are inflicting on the global economic system by causing wild exchange rate fluctuations. So long as the hedge funds are not as tightly regulated as ordinary mutual funds it would be risky to talk about free capital mobility.

Conclusion

The risks of unhindered capital mobility appear to be high so long as a country is not in a position to handle these flows efficiently. Among the three major types of flows, the advantages of DFI are clear as such flows can be directed in the desired areas as per the defined policy frame of a country. These flows are not volatile and therefore do not lead to unstable exchange rates. They are absorbed easily since the bulk of the inflows for a country like India would be in the form of imports of capital goods, technical know how, etc. Portfolio capital flows are likely to be destabilising as they are subject to sudden and often abrupt inflows/outflows. Such capital flows put unnecessary pressures on the exchange rate and money supply management policies. If the inflows cannot be managed efficiently portfolio capital is likely to be burdensome for the economy as debt servicing costs have to be borne by the host economy.

Money, Banking and Finance

EPW Research Foundation

WITH a view to complementing the various research contributions carried in this special issue, this section presents a set of 17 statistical series covering key aspects of the broad theme of 'money, banking and finance'. Considering the massive, detailed and complex nature of data sets available on the subject, the presentation here has had to be selective, bringing out the essential features of monetary and financial sector operations. As the scheduled commercial banks still constitute the most dominant component of the financial system, they occupy the maximum space in this statistical set.

Reflecting the rising proportion of the non-agricultural sectors in gross domestic product, as also the increasing sophistication in commercial transactions and improved banking habit, the share of currency in broad money (M_3) has steadily declined over the years, which is more sharply brought out in the concerned incremental ratios. Amongst the components of M_3, the fastest growth has been occurring in time deposits with banks, followed by demand deposits and currency in that order, that is, in the descending order of their liquidity. Divergent annual rates of growth in these components have been such as to give some stability to the composite M_3 growth, more so when fortnightly averages of M_3 are considered for individual years. As brought out by the RBI's *Working Group Report on Money Supply* (June 1998), the annual averages of M_3 growth based on year-end and fortnightly averages have remained more or less the same (17.5 per cent and 17.3 per cent) for the decade 1988-89 to 1997-98, but the yearly rates of increases have varied from 13.7 per cent to 22.3 per cent based on year-end data with a coefficient of variation of 15.6 per cent and from 15.7 per cent to 19.8 per cent based on average data with a coefficient of variation of 7.7 per cent (ibid, p 53). Interestingly, long-term monetary expansion has steadfastly remained at about 17.5 per cent, though the corresponding term trends (say, decadal rates) in related macro variables such as real economic growth and inflation rate have fluctuated significantly.

In factors influencing money supply, vast fluctuations are noticed in annual trends of individual components. Key revelations are: (i) the rates of increase in banks' investment in government securities have generally been higher in the post-reform period than in the comparable preceding period; (ii) banks' credit to commercial sector has not only grown at a slower pace during the recent years but has also shown sharp fluctuations in its annual expansion; and (iii) consequently, the proportion of the banks' commercial credit in aggregate domestic credit has tended to decline, the decline being the sharpest during the current fiscal year 1998-99 so far (from about 56.7 per cent to 54.5 per cent). Build-up of foreign currency assets has also contributed to monetary expansion, but the figures shown in monetary data in rupee terms have bulged partly also because of the sizeable depreciation of the rupee. The revaluation so effected of the foreign assets does not add to money supply; the book gains so made are transferred to the Exchange Fluctuation Reserve account, the balances in which constitute a part of the RBI's net non-monetary liabilities which have also grown sizeably.

The RBI's system of Basic Statistical Returns on banking statistics generate a vast set of aggregative data on different dimensions of the operations of scheduled commercial banks which are presented in Tables 2 to 11. The key revelations brought out by them are: (i) a rapid decline in the share of rural branches in the total number of bank branches, as also in aggregate deposits and credit, along with a sizeable rise in the share of metropolitan branches; (ii) a steady decline in the proportion of deposits held by resident individuals with all categories including farmers losing some ground but institutional deposits showing a rise; (iii) over 38 per cent of individual depositors still preferring to hold near one-third of fixed deposits in long maturity deposits of three years and above; (iv) further widening of the disparities in credit-deposit ratios amongst different states and regions in the post-reform period; (v) only about 52 per cent of agricultural credit coming from rural branches, while even that size of farm credit constituting merely 39 per cent of total credit given by rural branches; and (vi) a distinct fall in the number and proportion of small loan accounts in the recent period.

A glaring aspect of credit distribution has been the steady fall, in the post-reform period, in the relative proportion of bank credit extended in favour of the 'household sector' which essentially comprises farmers and other individuals and unincorporated enterprises along with small-size loans; this sector's share in total bank credit, which had reached a peak of 58.3 per cent in March 1990, had steadily slipped to 51.1 per cent by March 1996. The incremental expansion in bank credit during the quinquennium 1991 to 1996 has not only been the smallest for the 'household sector' (82.5 per cent as 162-175 per cent in the preceding two five-year or six-year periods), it has also been considerably smaller than that for private corporate sector (150 per cent) or for public sector (93 per cent). This broad picture is corroborated by many other trends in the distribution of bank credit in the recent period. First, there has been a decline in the share of bank credit rendered by rural and semi-urban branches together. Secondly, the relative proportions of credit extended to agriculture (15.9 per cent in March 1990 but 11.3 per cent in March 1996) and small-scale industries (12.4 per cent and 10.7 per cent) have experienced a distinct fall Thirdly, in the size distribution of bank loans, the share of small-size loans with credit limit of Rs 25,000 or less has dwindled from 22 per cent in March 1991 to 14.2 per cent in March 1996. Finally, there has occurred a sharper decline in the credit-deposit ratios of underdeveloped regions and states such as the north-eastern region (from 54.9 per cent in March 1990 to 35.5 per cent in March 1996), the eastern region (53.3 per cent to 47 per cent) and within the south-region, say, Kerala (from 63.1 per cent to 44.5 per cent).

In the relative performance of individual bank groups, there are many changes taking place though on expected lines. First, there has occurred a steady fall in the market share of 19 nationalised banks in the industry's aggregate deposits and credit, which has been essentially captured by new private sector banks; the market share of the State Bank group has generally remained intact. Secondly, as a result of the sizeable non-deposit resources com-

manded by the State Bank of India, the group's share in total assets (30.7 per cent) is higher than its share in aggregate deposits (27.4 per cent). The assets share of nationalised banks (52.5 per cent) is much lower than their deposit share (54.8 per cent), though this gap has narrowed in recent years. Thirdly, the deposit base of foreign banks has generally remained unchanged at about 7 per cent of the industry total, but their share in bank credit has slightly improved as a result of their reliance on non-deposit resources. Among private sector banks, it is the group of 10 newly set-up private banks which have competed away banking business from the nationalised banks. Finally, the nationalised banks continue to shoulder heavier responsibilities of social banking as a result of which their share in total bank branches or that in total bank employment has remained unchanged at 64 per cent and 60 per cent, respectively. However, with the foreign banks having been made to achieve certain targets in rendering priority sector advances, the proportion of such priority sector advances given by the nationalised banks has tended to decline, though not in relation to their total advances. Besides, the nationalised banks seem to have shown a degree of competition with the State Bank of India which is reflected in a rise in their share of public sector advances.

There are two other characteristic features of the financial sector developments in the recent past which are noteworthy. First, the outstanding stock of marketable debt instruments – sovereign as well as non-sovereign – have grown rather rapidly in recent years. This outcome came about as a result of two developments in the post-reform period – a sharp increase in the dependence of the central government on market borrowings, and a rising resort to bonds and other debt instruments by public sector undertakings as well as private sector corporate bodies. The liberalisation of interest rates on debt instruments, the withdrawal of budgetary and SLR-supported funds for public financial institutions and PSUs, and the depression in the equity market prompting corporate bodies to resort to the debt market primarily through the private placement route bypassing the SEBI requirement of credit rating, have been some of the factors responsible for providing the stimulus to the debt market. Emphasis on treasury operations by banks and FIs has given an added impetus to turnover in the debt market.

Estimates of outstanding sovereign debt have grown from Rs 176,770 crore at the end of March 1994 to Rs 287,750 crore as at the end of March 1998. Similarly, the stock of commercial debt has jumped from Rs 96,000 crore to Rs 136,130 crore, respectively. However, despite the apparently vast increase in the stock of marketable debt and despite the emergence of the debt market as a visible component of the financial system, the outstanding of debt instruments in relation to GDP or to industrial output has not grown, which probably explains the insufficiency of finance for rapid economic growth.

The second aspect of the financial sector development relates to the diversification of the financial system and the relatively faster growth of non-banking financial institutions. Again, interestingly as between banks and public financial institutions, much of the diversification had taken place during the 1980s whereas the 1990s have shown no noticeable change. Thus, the share of banks in aggregate financial assets had slipped from 73.8 per cent in March 1981 to 65.5 per cent in March 1991 with a corresponding rise in the share of FIs from 26.2 per cent to 34.5 per cent. But, subsequently, the relative shares remained at 64 per cent and 36 per cent, respectively, up to March 1998. Even the inclusion of NBFCs is unlikely to make any significant difference to this overall trend.

Table 1 (A): Money Stock and Key Components: 1970-71 to 1998-99

Last Friday/ Last Reporting Friday/ End-March	Components of Money Stock (Rupees crore): Currency with the Public: Currency in Circulation	Cash with Banks	Total (2-3)	'Other' Deposits with the RBI	Demand Deposits with Banks	Time Deposits with Banks	Narrow Money (M1) (4+5+6)	Broad Money (M3) (7+8)	Reserve Money (Rupees crore): Reserve Money (M0) (2+5+11)	Bankers' Deposits with the RBI	End Period Ratios: Currency to M3 (Per Cent)	Money Multiplier (M3/RM) (Multiples)	Incremental Ratios: Currency to M3 (Per Cent)	Money Multiplier (M3/RM) (Multiples)

Vol XXXIV No 5 January 30, 1999

Technology and Development

Bangalore's phenomenal growth in the software sector appears to be slowing down. Case studies covering a public sector unit, two MNCs and three indigenous firms which originated as small-scale units illustrate the new challenges facing this sector in the context of the ongoing shift from state intervention to liberalisation. **PE-2** The historical nature of the crisis which prompted the suicide deaths of cotton farmers may be better understood through a retracing of the route by which the present connections between Indian cotton and the mechanised textile industry were first established and the efforts through the khadi movement to provide a base for indigenous cotton technology. **PE-12** The Lentin Commission has brought out in stark detail the complex and corrupt links between a large public hospital, the multifaceted drug industry and the health bureaucracy. But this remarkable document is gathering dust today. **PE-39** The region covering almost the entire catchment area of the Koyna dam was declared a protected sanctuary, putting the livelihoods of the people of the area, the oustees from the dam site decades ago, in jeopardy once again. Environmental policies need to address socio-anthropological issues. **293**

Elusive Recovery

Two years after the first signs of the economic crisis, the south-east Asian region continues to be in the throes of a recession. Why has recovery been so elusive? The link between financial openness and the crisis, with the focus on Thailand and South Korea. **273**

Cotton Capers

Maharashtra's cotton monopoly procurement scheme, launched as a short-term measure in 1971, has become another holy cow. It is time the scheme was wound up. **250**

Reviewing WTO Systems

In the ongoing review process in the WTO India should pursue a strategy which seeks to make the present dispute settlement system less rule-oriented. **264**

Problem of Numbers

The Indian conceptions of numbers, in contrast to the general theory of numbers, have the potentiality of generating alternative perspectives that may be conducive to providing solutions to modern problems or in striking out new paths. **PE-22**

Steel Sense

Almost every country in the world is accusing the rest of the world of dumping steel in its backyard. Perhaps this is the right time to start a fresh round of discussions for a multilateral steel agreement that would ensure some order in steel trading. **257**

Erosion of BJP's Base

The 1998 assembly election results in Delhi, Madhya Pradesh and Rajasthan showed that the BJP has not only failed to gain support among the dalits, the adivasis and the poor, but has lost out among the educated elite youth and the upper castes. **287**

Workers' Co-operative

The Kamani workers' co-operative, the most celebrated case of workers' takeover in India, is facing numerous problems. What are the lessons the experiment offers? **254**

Jesuits and Astronomy

French Jesuit scientists in India in the 17th and 18th centuries contributed much to the grand theoretical syntheses of the celestial sciences which emerged towards the end of that period and initiated a discourse on Indian astronomy. **PE-30**

Nehru, Abdullah and Kashmir

Had Nehru not reneged on his promise to the people of Kashmir and to Pakistan and allowed Abdullah's Kashmir to retain the status it enjoyed prior to the Delhi Agreement, the nature of the Kashmir 'problem' would have been different. **268**

Using Medicare

Urban health policy has suffered because of lack of information about medicare utilisation patterns. Survey of two areas in Mumbai. **300**

Oil Politics

The Caspian region with its rich oil and gas reserves is rapidly becoming the focus of intense competition among the big powers. **260**

Memories of *EW*

ASHOK MITRA's 'Fifty Years Ago' (January 9) is nostalgic. I was privileged to have been one of those 'anonymous' contributors close to Sachin Chaudhuri in the fifties. It happened by accident. I sent him an article on 'Indo-Swiss Trade' for favour of publication either in 1949 or 1950. He sent a very friendly reply requesting information and light on India's agreement with Oerlikens of Switzerland on machine tools. This involved further research and improved the article considerably. Soon after he published another article from me titled 'The Spanish Tangle' (my title had been 'The Spanish Conundrum'). Articles followed at intervals on various subjects either as 'contributed' or under my initials 'SN'.

Sachin Chaudhuri was one of three persons in my life who encouraged research for further light on issues and who indirectly cultivated my desire and ability to write. We used to correspond even when I did not have an article to send him. He once suggested that I could send him notes or press clippings of interest and I used to send him a few every week. I was a kind of Delhi correspondent and *EW* issues arrived every Sunday by express delivery invariably when we were at lunch. I used to tear open the cover eagerly – in the midst of gulping 'sambar' or 'rasam' – delving into the contents and proudly pointing out what had been used from my notes and clippings. There was excitement at one time when an editorial scoop revealed the government's proposed centralisation and rationalisation of its economic advisory offices. I had made a small contribution to this story: it was not mainly or entirely mine, yet Sachin Chaudhuri generously told me that my note had triggered it off.

I recall a visit to Delhi by Sachin in the early fifties. At his request I accompanied him on his rounds on a Sunday and we met, among others, Acharya J B Kripalani and Sucheta Kripalani. She was an active member of parliament, he perhaps AICC general secretary. They worked from the same large hall, Acharyaji at one end squatting on a diwan, Suchetaji at the other end with a desk and chair. During this Delhi visit Sachin became aware that I was not as well off as he probably had thought, chided me for not asking for any remuneration for my articles and sent me a generous cheque from Bombay. (This must have been the early fifties since my income improved dramatically from the mid-50s.)

I had the privilege of being Sachin Chaudhuri's house-guest at Churchill Chambers. I think it was 1956; I arrived in Bombay at the height of the agitation for the separate state of Maharashtra. There was curfew. I was allowed to go to my office premises at Cowasji Patel Street where I spread my holdall bed on a large table and settled for the night. Next morn-ing I telephoned Sachin to meet him for a chat. He insisted on my moving into his apartment immediately even though he had another house-guest at the time. I had a pleasant stay chatting and drinking and eating, but had regretfully to depart the next day for Delhi.

In the sixties I became immersed in my career and there was little time for *EW*. In 1965 I moved to New York on an UN assignment but continued to receive and read *EW*. Soon after the transition from *EW* to *EPW* began. The Sameeksha Trust was set up and Sachin wrote to me in connection with raising funds for the Trust. In 1966 I was able to organise the collect-ion of two or three thousand US dollars from 10-12 Indian staff members of the UN Secretariat and remitted the amount under the Defence Remittance Scheme (which preceded the devaluation of the rupee). This was done spontaneously as were the contributions. This is small money by today's standards, but a good contribution then since UN salaries in New York at that time averaged only $ 1,000 per month. Looking back I am consoled that I could in this way acknowledge my debt to Sachin and *The Economic Weekly* for the opportunity provided to me to think, analyse and write, to expose 'light without heat'.

EPW's high standard and quality today is a tribute to the firm foundations laid by Sachin Chaudhuri and no less to the dynamism and continued upgradation by Krishna Raj and the Sameeksha Trust. Best wishes.

A Flood of Questions

IN the last paragraph of the excellent article by Kunda Dixit and Inam Ahmad ('Managing the Himalayan Watershed: A Flood of Questions', October 31, 1998), there is an incidental reference to the 'Three Country Study' undertaken by Centre for Policy Research, Delhi, Bangladesh Unnayan Parishad, Dhaka and Institute for Integrated Development Studies, Kathmandu, on co-operation by India, Bangladesh and Nepal in the utilisat-ion of the waters of the Ganga, Brahmaputra and Meghna. In the course of that paragraph there are some remarks which might give the reader the impression (perhaps unintended) that the Study Project, and in particular, the study of possibilities of augmentation of the lean season flows of the Ganga, have been hampered by the 'nationalistic' attitudes and the absence of enthusiasm for regional co-operation displayed by the Indian (i e, CPR) team. Such an impression would be quite erroneous; and the errors involved are many. I doubt whether my good friends and colleagues of many years (Q K Ahmad, Ainun Nishat and Sajjadur Rasheed), quoted earlier in the article would have said anything to warrant such a conclusion. Perhaps there has been a misunderstanding of some of their remarks. If so, it could have been cleared up if the authors of the article had considered it appropriate to talk to any of us in the CPR (myself, B G Verghese, R Rangachari) who have been involved in this project. I do not propose to enter into detailed corrective expla-nations here, as that would require a long letter, which would be a disproportionate response to what is after all only an incidental reference in the article. In any case, what matters is not the processes of inter-institutional meetings, discussions, exchanges of drafts and revisions that go on under the project, but what emerges from all this in the public domain, namely, the seminars and conferences that we organise, and the books and papers that we publish. Four books were published at the end of the first phase of the project in 1993-94, and now, as we approach the end of the second phase, one more book is in an advanced stage of preparation. I would request Dixit and Ahmad to wait for the appearance of that book.

RAMASWAMY R IYER

New Delhi

ECONOMIC AND POLITICAL WEEKLY

What about Some Law and Order?

IN the past week or so, homilies on the quality of tolerance to mark the occasion of Republic Day from the country's high and mighty have provided the grimly ironic backdrop to acts of extreme intolerance and brutality at the ground level. The burning to death of the Australian missionary Graham Stewart Staines and his two sons, aged 10 and seven, in Manoharpur village of Keonjhar district of Orissa on the night of January 22 as they slept in their jeep was as if it had been planned to evoke the maximum revulsion. Just a couple of days later, in yet another caste carnage in Bihar, 23 persons, including five women and nine children, were cold-bloodedly massacred by the Ranbir Sena in Shankarbigha village of Jehanabad district.

If anything could possibly have been as depressing as the grisly atrocities themselves, it is the response of politicians and political parties which has been unabashedly calibrated to extract from them the maximum political mileage. The murder of Graham Staines and his two children blended neatly into the tension involving Hindu organisations and Christian missionaries already stoked by the events of December last in the Dangs area of Gujarat. The Congress and the other opposition parties have lost no time in linking these developments to BJP's rule at the centre. Even some constituents of the BJP-led ruling coalition as well as the TDP which has been generally supporting the government have deemed it expedient to publicly distance themselves from the BJP with its links with shadowy Hindu organisations. From the other side, BJP leader L K Advani has rushed to absolve the Bajrang Dal of any role in the killing of the Australian missionary, evidently not bothered in the least by the fact that for the moment he happens to be the country's home minister. A three-member team of central ministers headed by defence minister George Fernandes returned from a hurried trip to Orissa convinced of the existence of "a deep-seated international conspiracy" behind the missionary's murder. Even a body like the National Commission for Minorities could not eschew the temptation to play to the gallery. A fact-finding team of the commission sent to Orissa felt it had to call a press conference in the capital even before it had submitted its report to the commission, just to let the world know that "certain forces", which it would not name, were behind the Manoharpur crime.

What the events of the last few weeks in Gujarat and Orissa have achieved is to push the secularism/communalism issue once again to the forefront of national politics. This has been very much the established pattern of political discourse in the country and evidently suits all the parties, the BJP not excluded in the longer run, notwithstanding the immediate tremors created for the government at the centre led by it. Not surprisingly, given the political stakes on both sides, communal tension and violence have continued unabated and ever new communal organisations have sprouted and flourished. The credibility of the supposedly secular camp, on the other hand, has been progressively eroded as it has come to be dominated by blatantly casteist outfits and as the secular credentials of the Congress itself have come under question. The result has been the flowering of the BJP to the position of one of the country's two principal political parties with a nationwide base. Elements within the secular grouping have done their cause no good, though they may have gained little vote-banks here and there, with their convoluted positions on the alleged relation legitimacy of minority communalism which have on balance and in the final analysis won electoral support for the BJP and emboldened the more openly Hindu organisations linked to it.

To deal more effectively with overt and violent manifestations of communalism it is necessary therefore to search for alternative approaches with the focus far more firmly on enforcement of law and punishment of wrong-doing. It is a paradox – or rather an inevitable outcome of the dominant concern of politicians and parties with exploiting communal tension and violence for political advantage – that for all the breast-beating about secularism and the hullabaloo that is orchestrated after every episode of communal violence, almost as a matter of rule and whatever the political colour of the government in office seldom are these crimes systematically investigated and those guilty prosecuted and punished. To take one instance, when after its protracted labours the report of the Srikrishna Commission enquiring into the riots in Mumbai in December 1992 and January 1993 was made public last year, there was much indignation, justifiable of course, over the commission's conclusion that the Shiv Sena had taken an active part in the riots. But this was by no means a startling revelation; the Sena's role in the violence had been well known and in fact had been even openly boasted about by that party's leaders. Yet the commission's equally significant finding that the Congress government then in office in Maharashtra had been conspicuously tardy in acting to prevent the spread of the rioting and in bringing those responsible to book raised no political hackles. In the killing of the Australian missionary in Orissa again, while charges have been flying thick and fast about whether or not the Bajrang Dal was involved in the attack and whether or not the principal suspect was a member of the Dal, it has been brought to light that this particular individual has systematically indulged in violence with communal overtones for the last many years, especially in forcibly letting loose cattle being taken to slaughter houses, and that in one of these incidents the Muslims accompanying the cattle had been so severely assaulted that one of them died of his injuries. Should not the 'secular' Congress government of J B Patnaik in Orissa be called upon to answer why this criminal was left free to carry on his activities without let or hindrance, culminating in the ghastly crime in Manoharpur?

CRIME AND PUNISHMENT

Enlarging Tolerance

J V Deshpande writes:

'THE buck stops here' president Truman is said to have remarked many years ago, referring to the American president's office in the White House. But that was in hedonist, materialist America, where a person holding public office is expected to accept the responsibilities that go with the office. Political life is organised differently in spiritual India. Here, more often than not, the buck keeps going round and round and eventually just vanishes into thin air. Grim tragedies and disasters just happen. No one is ever held responsible for them. Didn't a former prime minister observe sagely that when a great tree falls, shrubs and grass are bound to get crushed. This was in reference to the killing of thousands of Sikhs after the assassination of Indira Gandhi. It is all in your 'karma' and people, particularly the victims, had better accept their fate. Even official commissions of inquiry sometimes say as much.

Tolerance of wrongdoing, particularly in public life, seems to come particularly easy. A remarkable feature of the 50 years of freedom is the steady widening of the frontiers of tolerance. Was not financial finagling of thousands of crores of rupees involving stock-market operators, major banks and public sector financial institutions explained away by many responsible and learned persons as just a 'systemic failure'? No one has yet been found responsible for that financial crime. A senior cabinet minister hands over a secret letter to authorities of another country, requesting them to go easy with investigating a multinational financial crime suspected to have been committed by some Indians but he does not remember who gave him that letter. Tolerant India accepts his explanation with no questions asked. Government files involving the activities of suspected criminals and politicians believed to be in league with them mysteriously get lost and tolerant India accepts not only such loss but also the official explanation that no one is really at fault. Systemic failure again? Road and rail accidents, collapse of buildings and bridges, deaths in police encounters ('while resisting arrest') and in stampedes at pilgrimage centres and in political rallies are all accepted as nobody's fault.

Leaders of the gowari community took out a large procession to the Maharashtra state assembly then in session in Nagpur late in 1994 to present a petition to the government and try and meet the minister concerned to acquaint him of their grievances. No responsible person was free to meet them. They were blocked and caned at a point which had very few exits and in the stampede that resulted 114 persons were trampled to death, over a hundred of them women and children, who were, by design or by accident, at the head of the procession. The government ordered an inquiry into the ghastly tragedy. Its report was made public recently, four years after the tragedy, along with the government's Action Taken Report.

The commission has concluded that no one was really at fault. It could not pinpoint the immediate reason which caused the situation to go out of hand. It does not find fault with either the then chief minister or the minister in charge who were not able to spare the agitators even a few minutes of their time, even as the latter waited for over three hours, nor with the police for resorting to a cane-charge on the procession without checking that the people so attacked had adequate escape routes. The chief minister was apparently not informed by his office. The minister concerned is absolved because he was busy in the assembly, presumably for the entire duration.

The commission has also concluded that "in order to control this situation, as well as to prevent the participants to surge ahead to the Vidhan Bhavan, and also to avoid law and order problem, it was therefore but essential and necessary for the police force to resort to use of some force". To speculate now, four years after the event, what would have been the loss if some of the demonstrators had actually entered Vidhan Bhavan is, of course, pointless. According to the commission, "at the same time, it is necessary to note that the participants, as well as the leaders of the morcha, are not responsible for this incident". In short, in the words of the commission, "the incident is required to be styled and held as an UNFORTUNATE one" (commission's capitals).

This is an unsurprising conclusion in the country used to reading about the deaths of children in tribal areas – never due to starvation and malnutrition but always because of some temporary factors such as cholera, typhoid, black fever, etc. After all, the report on the gowari tragedy has been prepared according to the correct judicial procedures and the Commission of Inquiries Act. So the ordinary people of this country should accept it without demur, coming as it does from a person well-versed in the legal, governmental and political ways of the country.

POLITICS

Dangerous Game

A correspondent writes:

THE recent Congress Working Committee resolution stating that "Hinduism is the most effective guarantor of secularism" may reflect a politically expedient strategy, but is a questionable proposition from both religious and historical points of view. Besides, it has dangerous implications, if one goes by the past precedent of Indira Gandhi's disastrous strategy of wooing the Hindu majority in the 1980s, by appropriating symbols of Hindu hegemony that appeal to the Hindi heartland.

This attempt to invest Hinduism with the authority to protect secularism can be partly attributed to Sonia Gandhi's reaction to the Sangh parivar's propaganda that her position as the Congress president has encouraged Christian missionaries in the country to go on a proselytisation drive. In order to dissociate herself from the Christian minority community, she is now bending over backwards. But it is not she alone that is behind this shift in the Congress stand towards the religious sentiments of the Hindu majority. Defending the pro-Hindu line, the veteran Congress spokesman V N Gadgil is reported to have described it as "practical politics". According to him, the minorities put together are only 15 per cent, while the Hindus constitute 85 per cent, a "substantial part of which must be got back by the Congress".

By the term 'substantial part', Gadgil means the Hindu upper caste vote-bank in the Hindi heartland which at one time belonged to the Congress, but had shifted its allegiance to the BJP. By praising Vivekananda (which Sonia Gandhi did at a function at the Ramakrishna Mission just a few days before the Congress Working Committee session) and upholding the hegemony of Hinduism as the only religion that can protect the minorities, the Congress is trying on the one hand to regain its hold on the brahmin-rajput constituency and, on the other hand, to reassure the minorities of its secular image, albeit with a Hindu face. With growing disillusionment with the BJP (for its non-performance) among large sections of Hindus, the Congress now hopes that it can step in with a humane face of Hinduism that will appeal to these sections.

But such an approach will reinforce the already entrenched religious and communal biases that are increasingly influencing political choices in India. By glossing

over the oppressive caste system, obscurantist customs, superstitious beliefs and gender discrimination that are essential parts of Hinduism and still rule its practices, the Congress is trying to project Hinduism as a tolerant religion, just because it is the religion of the majority who have to be pandered to. No democratic and secular party (which the Congress claims to be) can uphold Hinduism, or any religion for that matter, as a panacea to solve problems in today's society.

Besides, such a strategy is likely to have ominous repercussions. In the 1980s, Indira Gandhi adopted a similar *realpolitik*, when in order to woo away Hindu voters from the BJP, she struck a pro-Hindu pose, made use of Hindu symbols and rituals with well-publicised visits to temples and talked about the "rights of the majority". This indeed helped her to take the wind out of the BJP's sails and led to its rout in the elections. But let us also remember that it was this game of soft hindutva that led to the gradual desecularisation and Hinduisation of the Indian polity. It legitimised the religious demands of the Sangh parivar. Its logical consequence was Rajiv Gandhi's decision to allow the opening of the gates of the Babri masjid and permit the notorious 'shilanyas' procession which unleashed the Hindu fanatical forces. There was no turning back after this.

Indira Gandhi set the course of pandering to the Hindu majority. When as a result the Sangh parivar made inroads into the polity and became a menace, her successors in the ruling Congress floundered from ambivalence to total abdication as eloquently demonstrated by the demolition of the Babri masjid and the riots that followed. Thus Indira Gandhi's strategy to fight the BJP on its own turf by appropriating Hindu symbols and rhetoric ended with the Congress itself being devoured by the forces of hindutva. This should be a warning to Congress politicians who are once again hoping to gain immediate mileage by playing the religious card, totally oblivious of the far-reaching consequences.

PAKISTAN

Press under Threat

THE ongoing tussle between the press and the government in Pakistan is hardly a new development. Over the last five decades the press in Pakistan has had a history of defying governments which have attempted to muzzle it. And interestingly, through it all, there has been a surprising solidarity within the press. In a sense, the press in Pakistan has been far more politically alive than its Indian counterpart. In the current case, for instance, although the Jang group has been the focus of attack by the government, there has been widespread protest among journalists and other employees of almost all newspapers.

The Jang group has now gone to court protesting against the stoppage of its newsprint quota. This is not of course the first time that the group has been subjected to such action. In 1972 it was one of the papers which was named by the Bhutto government as having "promoted the forces of disruption, called for recognition of Bangladesh, maligned the head of state and sought to undermine the morale and discipline of the armed forces". And *Jang* together with *Dawn* and others were victims of repressive measures including the withholding of newsprint quotas. This time around the Jang group called a press conference to make public the demands put on it by senator Saifur Rahman in return for dropping the charges of tax evasion against it. These demands included a promise not to conduct telephonic surveys on sensitive political issues, not to malign the prime minister, support his economic policies, etc. The revelations caused an uproar: the government had also asked for the dismissal of 16 senior journalists who were to be replaced by government nominees. Among them is Maliha Lodhi, editor of the group's English daily, *The News*. The group has not only refused to accept the government's 'advice' but has begun an advertisement campaign against the government captioned 'Press under Siege' inviting readers' participation. It has also challenged the government's actions in the Supreme Court which is due to hear the case next week. The paper has asked the Supreme Court to direct Saifur Rahman to refrain from monitoring and supervising its functioning.

The Nawaz Sharif government's new concern over the press is all of a piece with its recent attempts to muzzle criticism generally. This in itself is nothing new in Pakistan's history; however, the situation under Ayub Khan or under Bhutto was very different and Sharif's crude attempts will in the long run only make matters worse for him. For instance, it is for the first time that an elected government has invoked Article 45 of the constitution to set up military courts. Moreover this was done by an ordinance only days after the National Assembly had concluded its long session. The government has also been active in trying to curb the activities of NGOs, especially those set up and run by women. As in other south Asian countries, Pakistan has a number of NGOs involved in numerous activities, and it may well be, again as in other countries, that some are corrupt. But Sharif's ire against them is because they have been consistently critical of his abuse of power and denial of people's rights – in fact pushing back the movement towards democratisation of the country's institutions. This is not surprising given that many of these NGOs were directly involved in the movement which first put Benazir Bhutto in power, although it did not take long for disenchantment with her to set in.

CURRENT STATISTICS

***EPW* Research Foundation**

EU-11 accounts for 26.5 per cent of OECD's population and 27.5 per cent of GDP compared with the US's 24.5 and 34 per cent and Japan's 11.5 and 18.4 per cent. The dominance of EU-11 is in its export (47 per cent) and import (33 per cent) shares against the US's share of about 15 per cent each of export and import and Japan's share of 10.5 per cent and 6.7 per cent. Of OECD's 'high-tech' manufactured exports, the US share is 24 per cent, Japan's 20 per cent and EU-11's 39 per cent. The US, however, has a massive net surplus from technology exports followed by Japan, whereas almost all the EU-11 countries have a negative balance.

NICHOLAS PIRAMAL

Focusing on Core Business

WHILE some companies prefer to expand their business slowly over the years in order to grow, others opt for the mergers and acquisitions (M&A) route. Still others prefer a concoction of the two. Nicholas Piramal's growth strategy resembles an M&A exercise. The company acquired Gujarat Glass, a company engaged in the manufacture of soda lime bottles and vials which are consumed by the pharmaceutical industry, in 1984 (merged in 1991). The company began its pharmaceutical business by acquiring Nicholas Laboratories in 1988. In 1995, the company again acquired Sumitra Pharmaceuticals, which has engaged in exporting bulk drugs. In 1996-97, the company merged with Piramal Healthcare and Boehringer Manheim.

The M&A strategy, however, has saddled the company with a couple of virtually unrelated businesses. Apart from the obvious soda lime bottles manufacturing venture – only 5 per cent of the sale of bottles is for internal consumption at present – the bulk drug export business too could be described as more of an opportunistic move to enter a field that looked promising at one stage. Though the move looked like a breakthrough earlier, constant dumping by China, over-capacity, price downturn and a shake-out in the industry considerably reduced the available opportunities.

Realising its folly, Nicholas Piramal has now decided to concentrate on its core business of pharmaceuticals and hive off its unrelated divisions. The company has a presence in almost all the major therapeutic categories. Antibiotics account for a quarter of the company's total sales.

In a move that has made it a debt-free company, Nicholas Piramal has restructured its business by hiving off its two key business segments – Gujarat Glass and the bulk drugs division – into two separate subsidiaries. The move brought in a cash flow of Rs 225 crore. While Gujarat Glass accounted for around 20 per cent of the company's turnover, the bulk drugs business accounted for another 10 per cent.

After suffering a setback in 1997-98, when its bottomline declined by 16.4 per cent, the move could prove to be precisely what the doctor ordered. Considerably reducing interest outgo, the company will now be in a position to invest about Rs 500 crore over the next two to three years to improve its business.

While Nicholas Piramal will initially hold around 54 per cent of the glass subsidiary's equity, this will be moved up to 60 per cent depending of profitability of the business. The company has categorically stated that it will not be making any additional investments in bulk drugs, real estate, the stock market or other unrelated businesses including group companies.

The fall in the company's profitability during the year under review saw its earnings per share fall from Rs 16.3 to Rs 13.6. Bookvalue, too, declined from Rs 104.6 per share to Rs 103.3 per share. Strangely, the company decided to declare a higher dividend of 100 per cent in 1997-98 despite the fall in profitability, as compared to the 37.5 per cent declared last year. The company's equity share price currently rules around Rs 335 on the Bombay Stock Exchange, discounting its 1997-98 earnings by 24.7 times.

VIDEOCON INTERNATIONAL

New Projects

Videocon International, the flagship company of the Videocon group, performed well in 1997-98. While net sales were higher by 23.2 per cent over the previous year, the company's operating profit more than doubled. However, a sharp rise in interest charges and non-operating expenses offset the increase in profitability somewhat. Nonetheless, the company's bottomline improved by 30.3 per cent.

The company is a leading player in the colour television and washing machine markets in the country and has recently signed a memorandum of understanding for acquiring the Salt Lake city colour television unit of Philips. The company was in the news during 1998 when Dhoots, the promoters of the company, made an offer to acquire 2 per cent of the company's shares from the public. They will reportedly be increasing their stake every year until it reaches 51 per cent.

Besides taking over Philips' unit in Salt Lake city near Calcutta, Videocon International also plans to invest Rs 200 crore for setting up two greenfield production lines. These will comprise an audio factory and a white goods production line. The proposed investment will be carried out over a two-year period and will reportedly create 1,500 new jobs. Moreover, the company will also increase the capacity of the Philips unit to two lakh television sets.

The company has also decided to pick up a 40 per cent stake in the Rs 1,500 crore equity capital of a proposed Rs 4,500 crore naphtha cracker project which will be set up at Kuthekur near Surathkal. Work on the project is expected to commence by mid-1999 and the foreign collaborator is expected to have a 40 per cent stake in the equity capital of the mega project. The Karnataka State Industrial Investment and Development Corporation (KSIDC) is also expected to pick up a little less than 4 per cent equity in the project while the public holding will be around 16-17 per cent.

Videocon International has also entered into a joint venture with the Necchi Group – one of the largest manufacturers of compressors and white goods in the world. As per the terms of the arrangement, a new company under the name of Mecne SpA was established, and Videocon International has acquired a 50 per cent stake in the venture.

Videocon Narmada Electronics was merged with the company during the year under review. Consequently, the company's equity has now increased to Rs 71 crore. As a result, though net profit increased by 30.3 per cent, earnings per share fell from Rs 17.1 to Rs 16.2. The company decided to maintain the dividend rate at 35 per cent. Bookvalue, meanwhile, moved up from Rs 179.1 per share to Rs 186.1 per share. The company's stock presently quotes at around Rs 40 on the bourses, discounting its 1997-98 earnings per share by a mere 2.5 times.

EIH

From Business to Tourist Sector

The performance of EIH (formerly East India Hotels) was adversely affected by the depressed economic conditions prevailing in 1997-98. While earnings were virtually stagnant, the company's operating profit declined by 4.2 per cent. Sharp increases in interest charges (up 12.8 per cent) and depreciation (up 30.3 per cent) saw the company's bottomline fall by 5 per cent over the previous year,

NA means not available.

1996-97. Though earnings per share fell from Rs 33.8 last year to Rs 32.1, the company decided to maintain the dividend rate at 50 per cent, the same as last year. Book value moved up from Rs 102.3 per share to Rs 120.3 per share. The company's stock rules at around Rs 223 on the bourses, discounting its earnings by 6.9 times.

For the first six months of the current year, the company's income from operations was marginally higher by 6.5 per cent as compared to the corresponding period last year. While interest rose by 37.8 per cent, depreciation was higher by 14.6 per cent. The company's net profit was higher by 13.1 per cent during the same period.

The company has now decided to shift its focus from the business segment to tourism. The decision has been taken mainly because of the industrial recession in the country and better communication facilities which are causing poor average room realisations in the hotel industry catering to the business segment. In line with this strategy, it is planning to make a substantial investment in the next five years in the tourism sector and has already set up a core committee to prepare a strategy in this regard.

The company's brand name Oberoi is popular and it has recently commenced operations of Hotel Cecil in Shimla to cater to up and medium market tourists. Three other similar projects are also in the pipeline in Kerala, Himachal Pradesh and Rajasthan. EIH plans to invest up to Rs 500 crore over the next five years to set up the largest chain of tourist resorts. During the current year itself, the company has planned a capital expenditure of Rs 176 crore, a large part of which has been earmarked for such resorts.

The company was successful in its bid for the hotel site located at International Finance and Business Centre in Bandra-Kurla complex in Mumbai and plans to build a 500-room Trident hotel here. The cost of the project is expected to be in the region of Rs 400 crore. Work on the Trident hotel in Pune, a 175-room project, has also commenced and is expected to cost around Rs 115 crore. The company will also manage deluxe Oberoi brand hotels which are under construction in Chennai (325 rooms) and Agra (104 rooms), which are expected to open in 1999. New Trident brand hotels are also expected to open in Udaipur and Cochin in the next few months.

Maharashtra Cotton Monopoly Procurement Scheme

What Has It Achieved?

Madhav Godbole

The monopoly procurement of cotton scheme of the government of Maharashtra, launched as a short-term measure in 1971, has become another holy cow. Whichever political party has come to power in the state has pressed for its continuance. A review of the working of the scheme, however, leads to the unambiguous conclusion that it must be wound up at the end of its current lease of life in June this year.

THE monopoly procurement of cotton scheme of government of Maharashtra has got yet another lease of life. The government of India has agreed to extend the scheme by another year with the caveat that no more extension will be permitted beyond June 30, 1999. No one, least of all the state government, takes such empty threats seriously as such threats have been given by successive governments at the centre since the last two decades without ever following them up in practice.

The Maharashtra Raw Cotton (Procurement, Processing and Marketing) Act, 1971 (hereinafter referred to as the Act) was passed on December 23, 1971. It is one of the few legislations in the country which had a 'sunset' provision in that, as the Objects clause of the legislation emphasised in its opening sentence, it was to be "an Act to provide for carrying on *for a certain time* of all trade in raw cotton by the state of Maharashtra" (emphasis added). This was again repeated in the fuller text of the Objects clause of the legislation. Since the Act has continued to be in force for nearly three decades since then, it will be useful to begin the discussion by taking a close look at the Objects of the legislation:

> Whereas, *ginned and pressed cotton has been commanding a high level of prices at the terminal markets in the recent years*, nevertheless it has been brought to the notice of the government of Maharashtra that because of too many intermediaries and also defects in the marketing system, growers of cotton in the state do not get a fair share of the price for their crop;
>
> And whereas, *it is necessary to supply unadulterated cotton to consumers at a reasonable price, and to guarantee the purity of cotton and honest trade practices at processing centres;*
>
> And whereas, the government of Maharashtra has decided that all trade in raw cotton should be carried on by the state *for a certain time*; and for that purpose to take power for acquiring 'kapas' [unginned cotton] from growers and other persons having stocks of cotton, getting it ginned and pressed into bales, selling it in that form to consumers and others on behalf of the tenderers and paying compensation to the tenderers; and provide for matters relating to the purpose aforesaid; it is hereby enacted in the twenty-second year of the Republic of India as follows" (emphasis added).

Section 1(4) specifically provided that the Act shall remain in force up to and inclusive of June 30, 1980, and shall then expire. It also provided that Section 7 of the Bombay General Clauses Act, 1904, shall apply upon the expiry of the Act, as if it had then been repealed by a Maharashtra Act. Before the expiry of the Act, one would have normally expected the state government to review whether the Act needed to be continued further in the light of the changed circumstances from time to time, but it has become another 'holy cow' in the state. It is considered heresy to question the justification for the continuance of the Act. It is not therefore surprising that whichever political party came to power in Maharashtra, it pressed for long-term continuance of the Act. The present Shiv Sena-Bharatiya Janata Party (BJP) coalition government too has requested the central government to permit extension of the Act by 10 years. None of the successive governments at the centre, belonging to various political parties, had the courage to reject the requests of the state government at any time during the last 26 years. This is yet another proof of the competitive populism of political parties in the country.

It would be useful to take a look at some of the salient provisions of the Act and to examine the extent to which these have been adhered to in their implementation over the years.

'Guaranteed price' means the price determined as such under the Act, in respect of any specified variety of cotton, as payable to the cotton growers and other persons tendering kapas, at the collecting centres. Section 24 lays down that "at the commencement of every cotton season, the state government shall, *in consultation with the central government*, fix the guaranteed price for different varieties or grades of kapas and shall notify such price in the official gazette and in such other manner as it deems fit" (emphasis added).

The Act prohibits carrying on of business in kapas (Section 17), cotton ginning and pressing (Section 18), and transport of kapas outside the state (Section 19). Every grower of cotton is required to sell his produce to government (Section 20). Grading and pooling of kapas tendered at collection centres has been made obligatory (Section 22). Advance price payable to the tenderer is to be 80 per cent of the guaranteed price (Section 25).

Special attention may be invited to the provision pertaining to the fixing of the final price. Section 29 lays down that final price has to be announced, "having regard to the prices at which the bales of cotton, cotton seed and cotton waste were sold and the stock of bales of cotton, cotton seed and cotton waste on hand and taking into consideration all expenditure incidental to the handling of kapas and disposing of the same after ginning the same, and pressing it into bales...".

The Act provided for a Price Fluctuation Fund (PFF). Section 33 (1) made a provision that, "where for any cotton season, the final price is less than the guaranteed price, the amount of difference shall be paid from and debited to the Fund". "Where for any cotton season, the final price is more than the guaranteed price of cotton, subject to the provisions of Section 32 [payment of additional bonus], the amount of one-fourth of the difference shall be credited to the Fund..." (Section 33 (2)).

Section 32 provided for payment of additional bonus. "If for any cotton season, the amount at the credit of the PFF is equal to or more than 30 per cent of the average total sales of cotton during the three preceding seasons, the entire amount

realised in excess of the guaranteed price shall be distributed and paid as bonus to the persons concerned, in the same manner and subject to the deductions (if any) as laid down in Sections 26 and 27".

To begin with, the Maharashtra Co-operative Marketing Federation was appointed as the agent of the state government for this scheme. After gaining some experience, the Maharashtra State Co-operative Cotton Growers Marketing Federation (hereinafter referred to as the Federation) was appointed as an agent of the state government in February 1984 to implement the scheme.

The implementation of the Act was reviewed by four committees set up by the state government from time to time. Significantly, none of these committees was asked to examine whether the scheme deserved to be continued, and if so, whether in the same or in any modified form. The central government also does not seem to have insisted on the state government to get such an in-depth study made at any time before agreeing to the continuance of the scheme. The committees therefore confined themselves to the nitty-gritty of the implementation of the scheme. It would be useful to refer to a few important recommendations of these committees to place in proper perspective some of the subsequent ad hoc decisions of the state government, from time to time, regarding the implementation of the scheme.

The first of these committees was the Korpe Committee which submitted its report in 1976. Some of the salient recommendations of the Korpe Committee may be briefly brought out as under:

(i) The Federation should devise suitable mechanism to detect disproportionate tendering of kapas. Exemplary action should be taken against the personnel involved in smuggling of cotton. Follow-up action on green cards [issued to cotton growers indicating their land holding, area under cotton and past figures of tendering of cotton] should also be taken.

(ii) Grading of kapas at procurement stage is most essential and should be continued.

(iii) There should in all be four grades – super, fair average quality (FAQ), fair and X.

(iv) The committee recommended certain price differentials between various grades of cotton.

(v) For effective control mechanism of grading, the Federation should appoint senior and sufficient number of touring inspecting graders for each zone.

(vi) For scientific classification of cotton for effecting better sales, the Federation should set up laboratories at regional headquarters.

(vii) The scheme has every right to draw fully upon the funds of the co-operative banking system, the accumulation of which is, in no small degree, due to the scheme.

(viii) The original concept of fixing guaranteed prices on the basis of cost of cultivation should be adhered to.

(ix) There should be ceiling of Rs 40 crore on the accumulation in PFF. The PFF should be utilised for the trading activity of the scheme.

The second committee, N D Patil Committee, submitted its report in 1978. Some of the more important recommendations of the committee may be summarised as under:

(i) The original concept of fixing guaranteed price on the basis of cost of cultivation recommended by the Korpe Committee should be reintroduced.

(ii) The guaranteed price for 1978-79 season should be 15 per cent over and above the Agricultural Prices Commission Support Price.

(iii) If the Reserve Bank of India does not give the required financial assistance, the state government should come forward to meet the additional financial burden.

(iv) Any deficit beyond what can be accommodated by the PFF should be made good by the state government and should not be adjusted with the future accruals. This principle should apply for 1974-75 season and the deficit made good by government.

(v) The PFF belongs to the growers and the Federation should maintain personal accounts of the growers and give them pass books so that in the event of non-operation of the monopoly scheme, their share in the PFF could be distributed to them.

(vi) The deduction towards PFF should be at the rate of 5 per cent of the difference between the guaranteed price and the final price, in future, including the 1977-78 season.

It can be clearly seen how there has been a subtle, but significant, shift in the approach to the scheme, away from the origional intention of making it self-supporting, with larger and larger demands being made on the state government. There was also a major effort to reduce the contributions to the PFF. The scheme was no longer to be run on commercial lines with bank finance but was viewed as a typical departmental scheme of the state government with the entire financial burden, by way of making good the shortfall in working capital as also reimbursing losses, falling on the state government.

The third committee, known as the Hate Committee, which submitted its report in 1987, was set up by the state government against the background of the huge financial loss of Rs 386 crore sustained by the scheme during 1984-85 and 1985-86. Some important observations/recommendations of the committee are brought out below:

(i) Cotton production in Maharashtra in 1985-86 could not have been higher than 20 lakh bales. The Federation seems to have purchased, in 1984-85 and 1985-86, 3 lakh and 9 lakh bales of cotton, respectively, from outside the state. The loss on this account in 1985-86 alone was as much as Rs 103 crore. No proper precautions were taken to avoid this as also to make detailed enquiries in the matter. Such purchases were against the principles underlying the monopoly purchase of cotton scheme. The committee recommended a number of measures to put a stop to this practice.

(ii) It was wrong on the part of the state government not to accede to the requests of the Federation to temporarily suspend the purchase of cotton during the period of heavy rains.

(iii) Of the five varieties (super, FAQ, fair, X and 'kavadi') in which cotton is graded, only cotton produced by registered certified seed users should be graded as of super variety.

(iv) Fixation of guaranteed price higher than the support price led to the loss of Rs 81.72 crore in 1985-86. Similarly, paying a higher price for the newly developed hybrid variety AHH 468 led to the loss of Rs 67 crore to the scheme in that year.

(v) Quota for export of cotton may be given only to the Cotton Corporation of India (CCI) and co-operative institutions and not the private traders.

(vi) Looking to the grading of cotton in the international market, present grading of cotton be discarded and cotton should be graded in five varieties according to the grades adopted by the East India Cotton Association, namely, extra superfine, superfine, fine, fully good and good.

(vii) The Federation should set up a fully computerised high volume testing laboratory to ensure quality of the cotton sold in the domestic and international markets.

(viii) The inroads of private traders at the purchase centres, in the garb of cotton producers, is a matter of serious concern.

(ix) According to ideal grading standards, cotton of super variety should not be more than 20 per cent of the total. But, in 1985-86 cotton season, 90 per cent of

the cotton was graded as super/FAQ. Of this more than 60 per cent was graded as super. In future, super grade may be given only to the first and second pickings of cotton from pedigree and foundation seed plots. It must be incumbent on the farmer to produce a certificate to this effect from the agriculture department.

(x) The guaranteed prices fixed by the state government have been higher than the corresponding support prices declared by the central government and generally even higher than those recommended by the advisory committee set up under the Act. This has led to losses to the scheme.

(xi) Special steps may be taken for proper development of cotton crop in the state by promoting suitable newly developed varieties, stopping cotton purchases of age-old varieties not recommended any longer by the state and central government, making use of Cotton Control Act to prohibit growing of cotton not suitable for the area, keeping in view the soil and climatic conditions.

(xii) The committee expressed concern at the fact that though the state government had not fulfilled the conditions laid down by the Reserve Bank of India (RBI), regarding making good the financial loss of the scheme and providing margin money to the Federation, the Maharashtra State Co-operative Bank had continued to extend large financial assistance to the Federation, much beyond what was sanctioned by National Bank for Agriculture and Rural Development (NABARD)/RBI. Requirement of funds beyond what has been sanctioned by RBI should be met out of the state government budget.

(xiii) The contribution of the state government to the Capital Contribution Fund (CCF) of Rs 25 crore should be retained in the Fund permanently. If there is any shortfall in future, it should be made good by the state government.

(xiv) The state government should not give interest-bearing loan for meeting the loss sustained by the scheme. The outstanding state government loan of Rs 163 crore given to the Federation for this purpose should be converted into grant. This alone will help the Federation to open a new chapter on a clean slate. In future whenever the scheme incurs any loss, it should be borne by the state government.

The fourth committee, under the chairmanship of the then co-operation minister, submitted its report to the state government in 1994. This committee also proceeded on the assumption that the scheme has to be continued in future. Major recommendations of the committee are as under:

(i) The present practice of classifying cotton in five grades may be continued.

(ii) The purchase price of cotton may be decided each fortnight, or even at earlier intervals, based on prices in other states, processing and administrative expenditure, and expected margin of profit.

(iii) The provision regarding CCF may be deleted.

(iv) Stern steps may be taken to put a stop to illegal trading of cotton. All cotton users in the state must be made to buy cotton only from the Federation.

(v) The Federation should try to reduce administrative expenditure.

(vi) A forward linkage scheme of 'cotton to cloth' may be implemented in a pyramidal fashion by involvement of co-operatives.

(vii) Agriculture department should undertake special steps to increase cotton production in the state in consultation with co-operation department, agricultural universities and cotton experts in the field.

(viii) The present restrictions on the co-operative spinning mills to procure their cotton requirement only from their members may be done away with. Such mills may be permitted to buy cotton from non-members of the spinning mills as well.

The study group for the Ninth Five-Year Plan on co-operation and marketing appointed by the state government has, in its report, shown total lack of understanding of the major issues involved in the continuance of the scheme and has merely recommended that, in view of the reluctance of the central government to continue the scheme, it "should be brought under co-operative fold so as to make it more profitable to cotton farmers"!

The above background brings into sharp focus a few points. First, the need or relevance of the scheme has never been examined since the inception of the scheme and it has been assumed that for some unexplained(?) reasons it has to be necessarily continued. At no time was the question asked to why monopoly procurement was necessary only for the cotton crop and not other agricultural commodities. The only ostensible reason for the continuance of the scheme is to pander to the vote bank of cotton farmers in Vidarbha and Marathwada. Second, in this sense, making a 'sunset' provision in the Act has in practice been meaningless. Third, the initial concept of making the scheme self-supporting has been given up and now it has become the responsibility of the state government to meet all shortfalls whether by way of losses or deficits in the margin money, PFF and CCF. The RBI has been insisting on the state government making good the losses of the scheme as also providing the margin money.

Fourth, the initial objectives of the scheme to supply unadulterated cotton to the consumers at a reasonable price and to guarantee the purity of cotton have been frustrated. As can be seen, all the four committees had laid stress on proper grading of cotton. A number of steps were recommended by them to make the grading system rigorous and fool-proof. Instead, the state government has played havoc with grading by reducing, in December 1997, the number of grades for cotton from five to two, effectively giving unduly high prices for low grade cotton, and doing away with any incentive for growing superior quality cotton. Fifth, yet another objective of the Act was to guarantee honest trading practices at processing centres. As the analysis of all the committees has shown, this has not been achieved in practice.

Sixth, the guaranteed price has been fixed at levels higher than the support price. It also does not have any relation to the cost of production. The central government also is not consulted before declaring the guaranteed price. This is totally contrary to the original objectives of the Act. In fact, announcement of high guaranteed price has become an act of political patronage and successive state governments, whether belonging to the Congress, Progressive Democratic Front or the Shiv Sena-BJP coalition, have made use of this patronage to pauperise the scheme at the cost of the state government. Seventh, from 1994-95 season, the state government decided to give advance additional price, in addition to the guaranteed price, making a total final price of Rs 2,100 per quintal for H-4 super quality grade cotton, with final prices of other varieties being fixed accordingly. On an average this has meant paying about Rs 300 to Rs 400 per quintal higher than the prevailing market price. The latest example of this is the announcement, in January 1999, by the deputy chief minister of the state, who belongs to the BJP, that his party would insist on the price being stepped up from Rs 2,100 to Rs 2,500 per quintal. This was in retaliation of the announcement of Bal Thackeray, Shiv Sena chief, that he will insist on the state government supplying free power to the agriculture sector. This will further increase the losses of the scheme substantially. Eighth, ad hoc decision-making has been the bane of the system. Thus, for example, the deduction of 3 per cent amount from cotton price towards the CCF was suspended for the two years 1993-94 and 1994-95. This has increased the financial burden of the state government.

Ninth, the scheme has meant fragmentation of the cotton market by erection of barriers at the state boundaries. When several countries the world over are making strenuous efforts to establish common markets, we, in this country, are sacrificing the major advantage of one large market by its fragmentation. If not on any other ground, at least on this ground, this scheme which militates against the concept of 'one country one market' should not have been permitted to be operated at all. Unfortunately, the constitutional validity of the Act has never been tested and the scheme has been continued with impunity for the last 26 years. Economic reforms initiated since 1991 too have not made any difference to the continuance of the scheme. The only difference, if at all, is that the scheme is now being extended from year to year instead of being extended for three years at a time!

Tenth, the cotton crop in Maharashtra is a cash crop of farmers in the rain-fed area. Its productivity is therefore dependent on the vagaries of nature. Most of the cotton farmers are small farmers. These are, no doubt, important considerations. But, continuance of the cotton monopoly scheme is not an answer to the problem. It has nowhere been shown convincingly that the cotton farmer in the state has benefited from the scheme. There is considerable harassment of the cotton farmers due to malpractices at procurement centres, including delays in getting payment for the cotton tendered. As a result, even if prices are low in adjoining states, as is the case in 1998-99, some farmers prefer to sell their cotton in these states. Recent news reports indicate that cotton worth over Rs 75 lakh, which was being taken out of the state, was confiscated by police at the borders of the state. It is seen that in the years of low production of cotton, when the market prices in the nearby states are high, cotton is smuggled out from the state to take advantage of the higher prices in these states. In the years in which cotton crop is good and prices in the nearby states are low, huge quantities of cotton are smuggled into the state and brought to the procurement centres as the produce of Maharashtra farmers. It is necessary to remember that no state can operate as an island economy trying to rewrite the rules of the market place.

Eleventh, the scheme has made no difference to the productivity of or area under cotton in the state. The area under cotton in Maharashtra accounted for 35 per cent of the all-India total for the period 1993-94 to 1995-96. The area under cotton in the state did not record any increase during 1970-71 to 1990-91 on a point-to-point comparison. Only in 1996-97 the area under cotton in the state went up marginally. The yield (kg per hectare) of cotton in Maharashtra is the lowest among all major cotton producing states in the country and was only 111 in 1997-98 as compared with 691 in Madhya Pradesh, 486 in Andhra Pradesh, 435 in Gujarat, 379 in Tamil Nadu, 304 in Rajasthan and so on (Suresh Shah, 'This Season's Look Is Wet Cotton', *The Economic Times*, September 28, 1998). The difference may partly be due to the Maharashtra cotton being rain-fed but this cannot be the only reason. There has been no concerted effort to introduce new, hybrid, high yielding varieties of cotton, to adopt improved package of practices, to train farmers and so on. In this light too, it has to be accepted that the scheme has been a failure. In contrast, according to news reports, the CCI had earmarked an outlay of Rs 11 crore during the year 1997-98 for increasing the productivity of cotton crop in certain states in which it operates. Twelfth, the CCI, which operates on the basis of support price, has made profit for the 10th year in succession in 1997-98. In contrast, the Maharashtra cotton monopoly scheme has incurred a loss of Rs 1,152 crore till the end of 1996-97. The estimated loss for the year 1997-98 is of Rs 115 crore, making a grand total loss of approximately Rs 1,270 crore. It is necessary to note that, according to the provision of section 33(2) of the Act, the state government is bound to make good the deficit in the PFF. During the last four years since 1994-95, the deficit for the scheme is entirely due to the decision of the state government referred to earlier to pay advance additional price of Rs 2,100 per quintal for H-4 superfine variety of cotton and corresponding prices for the other varieties. One only hopes that this price will not be stepped up further to Rs 2,500 per quintal as demanded by the BJP in return for the BJP agreeing to the Shiv Sena proposal of supplying electricity free of cost to agriculture sector! Thirteenth, the state government has not been able to meet the large financial demands of the scheme. As a result, the Federation had to take deposits from the Mumbai Metropolitan Regional Development Authority (Rs 200 crore) and co-operative banks (Rs 212 crore). This is over and above the amount of Rs 743 crore which the Federation owes to the state government. Such funding of the scheme goes to show the seriousness of the problem.

Against this background, it is time the very justification for the further continuance of the scheme beyond June 1999 is examined afresh and steps are taken to wind up the scheme. The concepts such as monopoly procurement of cotton are a vestige of the Nehruvian socialist era and have been discarded the world over. One need not always believe in the magic of the market place but if one has to choose between the market and state trading in any commodity as a monopoly, one would have to opt for the former. Concerns regarding market imperfections are no doubt important but these can be dealt with by putting in place suitable regulatory mechanisms. Unfortunately, with its preoccupation with the perpetuation of the scheme, the government of Maharashtra has never explored these alternatives. It is high time both the state and central government show political courage and sagacity to do so. Let us hope the sun will finally set on this scheme in the god's good year 1999.

Worker Co-operatives in India
Lessons from Kamani

E A Ramaswamy

Is the Kamani experiment, the most celebrated case of worker take-over in India over? What are the lessons it offers?

KAMANI is undoubtedly the most celebrated case of worker take-over in India. Unfortunately, two of the three Kamani plants taken over by workers have ceased production. Kamani Tubes which was the first to be taken over and the object of so much attention and hope, ceased production in early 1997, and there seems to be little prospect of its ever returning to health. As for Kamani Metals and Alloys, the Mumbai plant ceased production in 1997, while the one in Bangalore is limping along. This is a tragic outcome for workers who sacrificed so much to revive the bankrupt Kamani firms and the trade union which spearheaded their campaign with such determination. While they have suffered an immense loss, worker take-over initiatives and the labour movement in general have been delivered a serious blow by this unfortunate development. While all this is extremely depressing, the Kamani experience also has valuable lessons to offer to whatever is left of the worker take-over movement.

The focus here will be on the internal structures, policies and arrangements which co-operatives need to evolve in order to survive and succeed. This does not mean that the external environment is unimportant. Government policies, legislative support and the extension of credit by banks and financial institutions are obviously of great importance. We also know that after liberalisation, the wider environment has become steadily unfriendly to co-operative effort. The policy environment in the country does not view worker self-help as an answer to the growing problem of plant closures and loss of employment. There is no clear strategy to help workers take charge of their own destiny. The government and the public sector are one with private capital when it comes to accepting closures and voluntary retirement as the only way to deal with the problem of industrial restructuring. These factors undoubtedly hamper the ability of workers and their unions to take over and manage industrial enterprises. Moreover, the internal structure and environment cannot in reality be separated from the external. When a firm is engaged in a struggle to find working capital, keep up production, pay wages and meet its minimum obligations to employees, survival becomes the sole objective. These harsh external realities are bound to cast their shadow on the internal environment.

While no one can refute any of this, it is equally true that co-operatives cannot function like other business enterprises. They have to evolve a culture which is distinctively co-operative. They must come up with internal arrangements which fit in with the co-operative way of life. Worker co-operatives have had to do go through this process of innovation everywhere in the world. There are no exceptions. In a country like India where industrial producer co-operatives are rare, there are no easy models to copy. The model has to be evolved through trial error. It is a difficult exercise full of trials and tribulations. Being a pioneer, Kamani has had to grope its way through this process. Kamani's experiments with worker ownership and self-management have much to tell other co-operatives, present and future, about the problems of internal governance. These lessons are too valuable to be lost sight of. It is for this reason that we must try and separate the internal environment and structure of Kamani from the external and see what lessons it has to offer.

Need for a Co-operative Culture

Internally, the fundamental problem at Kamani has been the absence of the spirit of co-operation. Formally and legally KTL and KMA are co-operatives, but a distinctly co-operative culture did not evolve. The period immediately after the buy-out was marked by tremendous enthusiasm and even euphoria. This found reflection in increased production, declining absenteeism, and the willingness and ability of workers to work without supervision. This was also the time which saw the first rudimentary attempts to put in place the institutions of self-governance such as the plant level committee and the general body of the co-operative, and provide education to members in the culture of co-operation. What did not take place, however, was a determined effort to press ahead with this process of experimentation and innovation with the institutions of self-management. Instead, the responsibility for running the company – and for institutional innovation – appears to have been transferred to professional managers. This was perhaps not surprising because there were no precedents within the country in worker buy-out to learn from, nor much of an exposure to international practice in this regard. With hindsight, of course, it does not come as a surprise that professional managers did not take even the first step towards institutional innovation. In the absence of a sustained effort to promote a sense of identification with the firm the initial enthusiasm was soon lost and the familiar industrial divide between workers and management – the feeling of 'them and us' – began to gain ground. Workers and managers started to blame each other for the poor performance of the company.

As the Kamani firms began to slide and the initial enthusiasm faded, workers who had willingly taken a wage cut began to compare themselves with those in neighbouring factories. It was especially hard to resist comparison with KEC, located in the same compound and organised by the same trade union, which paid its workers much better. Workers wanted a comparable livelihood and did not very much care if this came from a co-operative. Quite a few in fact felt that a co-operative ideology was incapable of providing a better livelihood and the solution to their predicament lay in a strong (and even totalitarian) managing director or take-over of the company by private interests. While these views were expressed a lot more by staff and supervisors, they also came increasingly from workers. Such perceptions can be attributed in part to the hardships experienced by workers and to propaganda by vested interests. On the other hand, the fact is also that little effort had been made to enable workers to view co-operation as a way of life. Co-operation is an ideological question, and ideologies do not simply happen. People have to be shown the centrality of the ideology to their existence, and this cannot happen without the evolution of co-operative institutions and education in the co-operative way of life, of which there has been very little. As a result, for most workers co-operation has been useful to the extent that it brought a closed factory back to life and restored jobs which would have otherwise vanished. That co-operation is also the way to sustain the Kamani firms and ensure their long-term future was hardly the common perception, with the notable exception of course of the core of trade union activists. In retrospect, the failure to cash in on the

early enthusiasm of workers and the expectation that managers would promote the co-operative spirit have turned out to be fatal mistakes.

The age profile of the workforce has tended to compound some of these problems. Most of the workers are well past middle age, and a good number are close to retirement. Indeed, Kamani had many superannuated workers on its rolls since there was no money to pay off their retirement benefits. The immediate concern of the retired and retiring workers has been their own future rather than the future of the company. They have argued, and from their own point of view quite rightly, that they have made enough sacrifices and the time must come to get something back in return. In addition to being uncertain about the future of the Kamani firms, they have felt that they themselves would not benefit even if the firms did turn around and become profitable. From their point of view, another group of workers might reap the fruits of a turnaround, whereas they have made all the sacrifice and endured all the hardship. Such workers seem to be among the strongest supporters of the view that the co-operative way of life has no future. They also have a natural interest in believing that it is somehow possible to sell of the property of the company and distribute the proceeds among shareholders.

Ownership Issues

Who owns a co-operative? The easy answer, at one level, is that a co-operative is owned by employees who have bought shares and others (such as the government and financial institutions) who may have contributed to its capital. While this large and amorphous group is ultimately the owner, there is a need for a more compact body which represents the ownership function from day to day and makes sure that the interests of those who have put in the capital are well protected. In some of the most successful producer co-operatives in the world, this function is discharged by the governing body of the co-operative. It is this body which takes policy decisions, appoints the management of the firm and supervises its performance. In the famous Mondragon co-operatives of Spain the governing body is in fact called the leadership. This leadership is clearly separated from management even though top managers too are members of the co-operative. Management is an executive function. It can contribute to policy-making, but the ultimate responsibility for policy lies with the leadership of the co-operative.

In contrast, the co-operative in Kamani appears to have taken a back seat. While its expressed intention is to take over and run the company, all it has done in practice is to elect a managing committee which in turn nominates two members to the board of directors. The co-operative and its organs, including its nominees on the board, scarcely think of themselves as having the right of ownership. They are willing to meet board members and make suggestions, but do not think that the board can be questioned or held accountable for its actions. The absence of an agency to adequately discharge the ownership function has been a glaring gap. While Kamani workers have waged and won an epic battle to gain control of their firm, the social engineering required to evolve self-management system has proved very much more difficult.

The more serious problem is that, after distancing itself from the ownership function, the co-operative has begun to act more like a trade union. Some members have contested elections to the managing committee on sectional platforms and tried to promote sectional interests after winning. Others have promised wage increases, knowing very well that this could not be achieved. Some have even demanded that the co-operative should be disbanded, the land in its possession sold off and the income distributed among the members. Not viewing themselves as the owners, they have made demands, leaving it to others to decide whether these demands can be conceded. It is difficult for most of us to think of a situation where those who own an enterprise make demands on it. What could their demands be? More importantly, before whom would they place their demands? In the view of the co-operative at Kamani, managing is the job of management. This has in effect meant that vital policy issues should be decided by the board of directors, with the managing director taking the lead. Acting in the belief that management is at the helm, and endowed with the power to consider any demand, the leaders of the co-operative have tended to place their demands before management.

As the co-operative sought to hand over more and more power to professional managers, a divorce between power and responsibility has taken place. In a bid to win favour with workers, senior executives have promised wage increases which the company could not afford, and which the board of directors was certain to shoot down. Such an arrangement could not – and did not – work. Kamani has had to change several chief executives within a short span of time because they took decisions without caring for their long-term consequences. The problem has been further compounded by a steady depletion in the number and quality of managerial personnel. Managers at the highest levels have failed to perform even basic managerial functions. There has in fact been a collapse of management.

The job of managers is to put resources to the best possible use. Since resources are by definition scarce, it helps no one to use them wastefully. The ultimate test of good management is the generation of wealth. One can argue that business must serve wider social objectives, but no social objective is served if an enterprise consumes more than it produces. Any form of economic activity, therefore, needs good management. Worker-owned firms need them all the more since it is only through economic performance that the ideology of self-management can be sustained in the long run. Workers of sinking firms might be happy in the short run that their jobs have been saved through self-help, but they would soon want decent living standards, a return on the capital they have invested and an appreciation in the value of that capital. No co-operative can satisfy its members for ever with the argument that jobs which might have been lost have been saved.*

It has not taken long for Kamani workers and their union to find out how critical good managers are to the success of the enterprise. In recognising the value of competent management, they have moved away from the growing tendency among organised labour to view managers as a parasitical class that earns too much for doing too little. The problem however is that recruiting and retaining talented managers has proved a Herculean task. The inability of the cash-strapped Kamani enterprises to compete for talent in the labour market is only part of the story. The more difficult task has been to find managers who can function in an enterprise whose workers are also its owners. Since there are few worker-owned firms in the country, it is no wonder if managers find this an unfamiliar arrangement. Their response to this predicament has been to swing between extremes. Some have taken the view that while workers might well be the owners of the firm, once inside the plant they are workers like in any other factory and must respect the authority of managers. Others have turned populist by going along with workers' wishes and demands. Neither response has been particularly helpful. Authoritarian attitudes do not sit well in a democratically owned

plant. Reckless populism, on the other hand, is an even bigger disaster. Even after a co-operative has been formed, the natural tendency of workers is to place their demands before managers. Having got used to the ways of the public and private sector, it is almost impossible for them to get awy from this mindset. When managers turn populist and concede what the firm cannot afford, workers scarcely realise that short-term benefits are being given at the cost of long-term survival. Where there is no strong ownership function, as has been the case at Kamani, the problem is to find someone who can apply the brakes on this dangerous practice. At Kamani, as we shall see, the union has had to take on this unpleasant task, with serious consequences for its own popularity and role clarity.

Co-operatives make greater demands on managers than either public or private sector enterprises. Managers must deliver efficient performance as in any other business, but must accept that ownership has been democratised and that the workers they are dealing with are not quite the same as in other firms. At the other end, the familiar symbols of ownership are no longer present. Worker-owned firms may have boards of directors, but true ownership vests with the co-operative and its managing committee, which too are democratic bodies with their own compulsion and contradictions. Worse still, there may be a vacuum in the place of ownership, confounding managers even further. As if all this is not sufficient, Kamani expected its managers to exhibit owner-like behaviour, assume owner-like responsibilities, and engage in the social engineering necessary to evolve self-management structures. And all this was happening at a time when the managerial force was being seriously depleted and managerial quality was insufficient to meet even normal expectations. There are no easy solutions to the problem of finding suitable managers for worker co-operatives, especially if the co-operative cannot compete in the labour market for managerial talent.

Role of Union

Worker take-over of collapsing firms is such a complex and daunting task that there is no chance at all that it can happen without an uphill battle by a trade union. The campaign waged by the Kamani Employees' Union (KEU) to take over Kamani Tubes and Kamani Metals and Alloys is too well known and well recognised to need repetition. To set the record straight, unions which favour worker take-over are an exception, and the KEU is most certainly one of them. The stand of the vast majority is simply that the public sector should not privatise and the private sector should not be allowed to close down.

What should a trade union do after it has brought a closed unit back to life? What is the legitimate role of a union in a worker-owned enterprise? Do worker-owned firms need a trade union in the first place? What kind of grievances might workers have that require a union's intervention. Although these are new and unfamiliar questions to most of us, other industrial societies have faced them and come up with some answers. We can learn from their experience, although there are important differences between their situation and ours which must be kept in mind. Elsewhere in the world, the initiative to form worker co-operatives has not come from trade unions. These co-operatives have been organised from scratch and not salvaged from bankruptcy through take-over, and a trade union has mobilised the workers subsequently, as in any other firm. In contrast, Indian producer co-operatives formed under the Sick Industrial Companies Act (SICA) on the directions of the BIFR would not have been born if it had not been for a union. The trade union is not a subsequent formation, but the very force which has given birth to the co-operative. It is against the backdrop of this difference that we must consider international experience.

At one extreme, it has been argued that since employee ownership does away with the divide between labour and capital, a trade union is unnecessary. This is the stand of the Mondragon co-operatives in Spain which permit neither trade unionism nor any form of industrial action. Strikes are considered by Mondragon to be an attack on the co-operative and punished with dismissal. But of course, Mondragon has strong democratic traditions and powerful democratic institutions evolved over decades of experimentation to ensure that workers have an effective voice at every level. Trade unions do exist in most other co-operatives, but they rarely perform conventional union roles. Industrial action loses its relevance in co-operatives since workers would eventually have to aim a strike at themselves. Moreover, it is considered absurd for a union to bargain for higher wages with a management that has no ownership rights. Trade union responsibility therefore boils down to protecting workers against arbitrary and unfair treatment in the matter of discipline, promotions and the like which can take place even in a worker-owned firm. Trade union relevance is limited largely to redressing micro-level grievances.

The situation at Kamani is entirely different. The trade union has had to take on diverse roles, some of them in direct conflict with its primary objective as a union. With the co-operative failing to act as the owner of the business, ownership has become a trade union responsibility. Worse still, the co-operative has tended to act like a trade union, forcing the union to take positions which seem anti-labour. There has been such a stark reversal of roles that the common remark at Kamani is that the co-operative has become the union while the union has become the co-operative. Populist managers have added further to the union's burden by making promises that canot be kept. Hard pressed workers accustomed to viewing managers as anti-labour are unable to comprehend why their own union should come in the way when management is so generous.

It is awkward for a union which should be asking for more to plead that workers should accept less, which is precisely what the KEU has had to do. Few institutions at Kamani have suffered as much as the KEU from the lack of role separation between management, co-operative and trade union. By taking on all three roles the union has not only not achieved very much for the Kamani firms, but brought enormous problems upon itself. For a union, the price of extreme role reversal is loss of popularity, and the KEU has had to pay that price. It has been held responsible by many sections for everything that has gone wrong. Among the few to empathise with the union's predicament are its own cadres for whom trade unionism is truly a way of life.

Kamani's experience tells us not only what the union should not, or cannot do in a worker co-operative, but also what it should. Indian trade unions cannot retreat into the shadows or limit themselves to the redressal of shopfloor grievances in the manner of unions elsewhere in the world. They have brought the co-operative to life and they are among the few institutions to have an interest in their success. The environment is so hostile for co-operatives that without a union they would be friendless. And yet, the union cannot become labour, management and owner rolled into one. These roles have to be played by others if co-operatives are to have a chance of survival. The union's role is to experiment and innovate the institutions of self-governance. It has also to be the watchdog which oversees these institutions to make sure that they function as they should.

Worker co-operatives have to find ways of preserving and harnessing the enthusiasm generated among members in the early days of their formation. Without popular participation, the spirit of co-operation is impossible to sustain. One of the most useful ways of promoting participation is to involve workers in the reorganisation of work. Industrially developed nations have been experimenting with employee involvement in the labour process for well over a decade. Unlike in earlier times when workers were expected to merely carry out the directives of their superiors, it is now acknowledged that they have a fund of knowledge which can help improve the production process. The effort is to get workers to find ways of accomplishing tasks more efficiently with less materials, in less time, with less effort, with better quality, and with greater safety. In the quest to promote efficiency, organisations across the world have been promoting such direct participation of ordinary working people in the nitty-gritty of their work. Improved efficiency is only one of the benefits of such participation. A more fundamental outcome is the sense of involvement with the firm and its objectives. There is much that co-operatives can learn from these experiments. Direct participation in work should be far more easy and very much more natural where workers are also the owners of the business. It is an interesting new way to promote the spirit of co-operation, sustain the enthusiasm of workers and harness their energies for a common purpose.

In retrospect, the main lesson of the Kamani experiment is that worker-owned firms have also to become worker-controlled and self-managed if they are to survive. Ownership is only the first step, and perhaps the simpler one. Once a firm has been taken over by a worker co-operative, ways have to be found for putting in place democratic control and management structures. This job must begin when workers are still full of enthusiasm. It cannot wait for a later date. While it is true that worker co-operatives are confronted with a hostile world internal reform cannot be treated as a secondary task that can wait until the external constraints are overcome. On the contrary, co-operatives need internal struggle to be able to face external threats. Kamani is not alone in this. A major weakness of co-operatives in general is that while they are worker-owned, they are neither worker-controlled nor worker-managed.

Protectionism vs Unfair Trade in Steel

C Satapathy

Suddenly everyone seems to have forgotten the theory of competitive advantage and the benefits of free trade. Practically every country is accusing the rest of the world of dumping steel in its backyard and trying to protect its steel industry, backtracking on free trade promises. Perhaps this is the right time to call a halt to the protectionist trend and start a fresh round of discussions for a Multilateral Steel Agreement which would ensure some order in steel trading.

ABRAHAM LINCOLN is said to have argued, "If I buy a foreign good, I have the good and the foreigner has the money; whereas if I buy the same good locally, I have the good and our country has the money, too."[1] Economists may call such protectionist arguments fallacious but such arguments continue to be heard even today. According to the latest (November/December 1998) worldwide opinion poll by *The Economist*, 56 per cent of the Americans favour protectionism to only 37 per cent favouring free trade.[2] The question asked was: 'Which of the following two broad approaches do you think would be the best way to improve the economic and employment situation in this country – protecting our local industries by restricting imports, or removing import restrictions to increase our international trade?' Worldwide, the protectionists were 47 per cent against 42 per cent free traders. Of the 22 countries surveyed, protectionists outnumbered free traders in USA, UK, France, Italy, Canada, Australia, India, Philippines, Brazil, Chile, Mexico, Russia, Malaysia and Indonesia. Free traders were in greater number only in the remaining eight countries: South Korea, Taiwan, Germany, Thailand, Japan, Hongkong, China and Spain. It is often said that in good times people are happy to enjoy the benefits of free trade whereas 'recession is the midwife of protectionism'. However, it is inexplicable by such conventional logic that eight years into an economic boom, only 37 per cent Americans favour free trade, whereas in the crisis-ridden South Korea free traders far outnumber the protectionists despite the fact that "finding a job is harder than pulling a star out of the sky" in South Korea today.[3] Nevertheless, the US continues to project itself as the staunchest defender of free market!

For the past few months, a lot of noise is being made in the US against increased steel imports. On October 15, 1998, the US House of Representatives passed a resolution with an overwhelming majority of 345 to 44 that the US president should review imports of steel from Australia, Brazil, China, South Africa, Ukraine, Indonesia, India, Japan, Russia and South Korea and should immediately consider imposing a one-year ban on imports of all steel products. It also called upon the president to establish a task force to closely monitor imports of steel and to submit a report to the Congress in the first week of January 1999. On November 13, 1998 the United States International Trade Commission (ITC) gave a finding that US steel industry was threatened by material injury by import of hot rolled steel products from Brazil, Japan and Russia. The Commission's determination was unanimously supported by all the six commissioners: three Democrats and three Republicans. During his visits to Japan and South Korea in late November 1998, president Clinton not only questioned increased steel exports to the US but also warned, "since the US economy has continued to grow, the American people and the American political leadership have supported keeping the US market open, but if there is a perception of unfair trade the consensus could disappear". *The Public Ledger* also reports on December 14, 1998 that since the outbreak of the Asian crisis the US government has taken a protectionist stance particularly in the steel industry and that it has even backed local producers who have filed law suits against competitors from Russia and Japan. The United Steel Workers of America Union has urged that the administration has an obligation to stick up for the workers and not just give their jobs away. Massive rallies held across the mid-west and television advertisements exhort Americans to 'stand up for steel'. US Senate has a powerful 40-member steel caucus and several senators are critical that the US president has not done enough for protecting the suffering American steel workers. Senator Robert Byrd has accused the president of "taking baby steps when

leaps and bounds are needed". Senator Jay Rockefeller feels that the president is more concerned about the global economic effect of taking action on steel than protecting suffering American workers. The strongest words, however, came from Republican senator Arlen Specter, chairman of the Senate steel caucus who says, "you have a steel industry haemorrhaging with the flooding of our markets with foreign dumped steel, causing the loss of thousands of jobs, and the administration is applying a small Band-Aid". In response to the American Congress Resolution of October 15, 1998, the Clinton administration has since released a seven-point plan against high level of steel imports on January 7, 1999. These are:

(1) Bilateral talks with Japan, Russia and Korea to reduce exports to the US.
(2) Strong enforcement of US trade law promising to expedite anti-dumping and anti-subsidy action.
(3) Expediting Section 201 safeguard action.
(4) Instituting early warning system to monitor steel imports.
(5) Restoring global economic growth to ensure market-based reform in distressed steel exporting nations.
(6) $ 300 mn tax relief to the steel industry over a five-year period.
(7) Assistance for out of work steel workers.

There are reports of increased trade tension between Japan and US. Charlene Barshefsky, the United States Trade Representative (USTR) says that steel is perhaps the most visible element of this tension.[4] There are also warnings from US to Japan to cut steel imports quickly or face retaliatory action. South Korean Pohang Iron and Steel (POSCO), the second largest steel maker in the world, has since announced voluntary cut in exports rather than risk retaliatory action. The US is also blaming EU that it is not absorbing enough steel imports from Asia. On the other hand, steel workers of Europe, in a petition to EU, have criticised the US decision to impose dumping duties saying, "this leads to the diversion of even more steel deliveries to the EU".

Under the US domestic law, the industry and the government can typically take recourse to any of the following actions to protect domestic industry:

(a) Levy of countervailing duty and anti-dumping duty

US industries may petition the US government under Title VII of the Tariff Act of 1930 for relief against dumped imports sold at less than fair value or against imports which are subsidised by foreign governments. The US department of commerce determines whether dumping or subsidising exists and if so, the margin of dumping or amount of subsidy. The ITC determines whether the dumped or subsidised imports have materially injured or threatened to materially injure the US industry. On a positive determination, the secretary of commerce issues a countervailing duty order (in a subsidy investigation) or an anti-dumping order (in a dumping investigation) which is enforced by the US customs service. These investigations are referred to as '701' investigations and '731' investigations after the respective initial sections in the Tariff Act of 1930 for countervailing and anti-dumping duties.

(b) Section 201 action

Under Section 201 of the Trade Act of 1974, domestic industries seriously injured or threatened with serious injury by increased imports may petition the ITC for relief. Section 201 of 1974 Act does not require a finding of an unfair trade practice as does the Act of 1930. If ITC determines that an article is being imported in such increased quantity that it is a substantial cause of serious injury or threat of injury, it recommends a relief to the president who makes the final decision. Such relief can be in the form of tariff increases, quantitative restrictions or orderly marketing agreements. ITC can conduct investigation under Section 201 upon receipt of a petition from a trade association, firm, recognised union, or a group of representative workers. It can also conduct similar investigation on a communication from the president or the USTR and also upon receipt of a resolution of the House Committee on ways and means or Senate Committee on finance; or upon its own motion.

(6) Section 301 action

Section 301 of the Trade Act of 1974 is the principal statutory authority under which the US imposes trade sanctions on foreign countries. By providing the means of a credible threat of retaliation, it empowers the US government to negotiate and enforce trade agreements. Section ·01 investigation can be started on a petition to the USTR by an interested party. The USTR can also self-initiate a Section 301 investigation for trade retaliation. The USTR is authorised to take retaliatory actions, subject to the direction of the president, including imposition of duties and import restrictions on goods.

During the recent past, several of these actions have been initiated at the instance of US steel industry and US steel workers. These include:

(i) '701' and '731' investigations against stainless steel plate from Belgium, Canada, Italy, Korea, South Africa and Taiwan (May 1998).
(ii) '731' investigations against stainless steel round wire from Canada, India, Japan, Korea, Spain and Taiwan (June 1998).
(iii) '731' investigations against stainless steel sheet and strip from France, Germany, Italy, Japan, Korea, Mexico, Taiwan and the UK (August 1998).
(iv) '701' and '731' investigations against hot rolled steel products from Brazil, Japan, Russia (September 1998).
(v) '701' and '731' investigations against stainless steel wire rods from Germany, Italy, Japan, Korea, Spain, Sweden and Taiwan (September 1998).
(vi) '731' investigations against carbon steel flat products from Russia, Brazil and Japan (September 1998).
(vii) Section 201 petition against steel wire rod from 39 countries including India (December 1998).

In addition to taking these actions, Charlene Barshefsky, the USTR has warned Japan on January 12, 1999 to cut steel exports quickly or face retaliatory action. Apart from expediting pending anti-dumping cases and initiating fresh ones on other varieties of steel, the USTR is determined to self-initiate retaliatory action under Section 301 against Japanese steel imports if Japan does not take urgent action to reduce its steel exports to US. The warning has been subsequently reiterated by president Clinton in his State of the Union address in the absence of suitable response from Japan.

While US steelmakers are crying foul against increased steel imports, which grew by 30 per cent in the first 10 months of 1998, similar noises are also being made elsewhere. EU for the first time became a net importer of steel registering a 70 per cent increase in imports in the first half of 1998. The steel makers and workers in EU are also agitated and at their initiative, the following actions have been initiated recently:

(i) EU opened investigation into dumping of hot rolled coils from Bulgaria, India, Iran, South Africa, Taiwan and Yugoslavia on January 7, 1999 on a complaint filed by Eurofer, association of European producers in November 1998. The imports are said to have increased 200 per cent in 1998 with dumping margins up to 67 per cent.

(ii) EU has fixed agreed quotas on steel imports from Russia and Ukraine and autonomous quotas in respect of steel imports from Kazakhstan.

(iii) Eurofer has also filed anti-subsidy cases against hot rolled coils from India, South Africa and Taiwan in December 1998.

(iv) EU has imposed countervailing duties against stainless steel bars from India.

(v) EU has started investigation into dumping of stainless steel plates from South Africa and Slovenia.

(vi) EU has imposed anti-dumping duties against seamless tubes from Russia, Romania, Czech Republic and Slovakia. Dumping complaints have also been filed against similar imports from Ukraine and Croatia.

US and 15 member states of EU are not the only countries that have taken recourse to such protective action against import of steel. There are 21 other countries such as Argentina, Brazil, Canada, Chile, Colombia, Czech Republic, Egypt, India, Indonesia, Israel, Malaysia, Mexico, Philippines, Russia, Singapore, South Africa, Taiwan, Thailand, Turkey, Venezuela and Viet Nam which are either investigating dumping cases or have imposed anti-dumping duties.[5] In addition, Hungary has imposed quotas on steel imports from Czech Republic and is considering similar action on imports from Romania and Poland. India has recently imposed anti-dumping duties on hot rolled steel products from Russia, Ukraine and Kazakhstan. It has also fixed floor prices for seconds and prime grade steel originating from all countries. Indian steel industry is going through difficult times both on account of cheaper imports at home as well as its exports to major markets like US, EC and Canada being subjected to protectionist measures. Nearly all the major steel producing and consuming countries numbering about 40 are involved in restricting their doors to foreign imports and protecting their own domestic industries. Rightly *Metal Bulletin* bemoans, "Whatever happened to the lofty ideals of free trade and non-discrimination espoused by most of the world's trading nations at the formation of the WTO only four years ago? As far as steel is concerned, national markets are steadily, one by one, closing to imports. Protectionism is becoming more usual than free trade."[6]

Suddenly, everyone seems to have forgotten about the theory of competitive advantage and the benefits of free trade. Practically every country is blaming the others of dumping steel in its backyard and is trying to protect its own steel industry back-tracking on free-trade promises. The trend is typically protectionist, only difference is that instead of hiking import tariffs or imposing quotas on imports, recourse is being taken to anti-dumping, countervailing and safe-guard actions as these are WTO mandated. Anti-dumping duties are particularly popular as these "can be presented not as protection but as redress against unfair protection".[7] Indian exporters have often complained about trade data being manipulated to prove dumping/injury and there being certain lack of transparency in the methods followed in other countries. Often considerable damage is caused to the trade by merely starting dumping or anti-subsidy investigations. Sometimes these are politically motivated and upon failure of one investigation, another one is started. Moreover, anti-dumping duties are heftier than the normal tariffs of many developed countries and once imposed, they remain for five years. The legal costs of fighting these cases are also particularly high in the US and EU.

Many believe that the recent state of anti-dumping and other measures initiated worldwide in respect of steel imports are not so much to prevent unfair trade as to bring back protectionism by the backdoor. After all, such anti-dumping action is hardly on account of predatory pricing. Studies have shown only 3 per cent anti-dumping cases in EU and 4 per cent anti-dumping cases in US involved possible predatory pricing. Such studies also show that "anti-dumping duties are generally twice as costly to the economy as equivalent import tariffs" [8] More and more of such protectionist action by US and EC and followed by others can only push the international trade in steel from one crisis to another.

The present crisis in steel trade can be traced back to the earlier financial crisis of Asian countries and the near collapse of Russian economy. The crisis in Asia resulted in less construction and other infrastructure building activities. This pushed down Asian demand for steel. In turn, even the steel produced in Asia became surplus. Diversion of Russian and Asian steel to US and EU markets was the only alternative to cutting down production. Over supply pushed down prices everywhere. Over the years, steel capacity has been enhanced in Asia and elsewhere anticipating increased use. The extent of drastic fall in demand in Asia for steel in 1998, which led to global over supply, and consequent price fall was perhaps beyond anyone's anticipation. Steel requires very heavy investment and long period to commission a plant. Uncertainty in steel demand therefore has very disastrous consequences for the industry. In many ways, steel also mirrors the future of other commodity markets. As such, the world community must address the present crisis in international steel trade with greater political wisdom and statesmanship. What is at stake today is not only the 250 million tonnes of steel traded internationally per annum but the repercussions of the steel crisis in all other markets. Trying to cut each other's throat by imposing protectionist measures in the name of curbing unfair trade is not going to help matters. Few years ago, discussions on a Multilateral Steel Agreement had not succeeded. Perhaps this is the right time to call a halt to the protectionist trend in steel trading and start a fresh round of discussions for a Multilateral Steel Agreement which would ensure some order in steel trading. So far US has been merely talking tough apart from initiating several trade disputes and threatening further action under Sections 201 and 301 of its trade law. Once these actions fructify and the threats are carried out, doors of the world's biggest steel consumer will be closed plunging the steel trade to a greater crisis. World leaders should utilise the opportunity provided by the somewhat soft stand of the present US administration to work out a new world order for steel trade before it is too late. As early as the first week of November 1998, ambassador Hans Colliander, chairman of the OECD Steel Committee had warned, "the steel trade is one of the first sectors to experience serious disturbances stemming from the financial and economic crises, but that other sectors are also affected. Steel producers and especially governments in all regions of the world should, therefore, be aware that their response to the problems facing steel could signal a precedent for other sectors in the economy".[9] Threat of protectionist action from all round the world, however, indicates that no one is prepared to listen to such advice.

Oil Politics in Central Asia

R G Gidadhubli

The Caspian region, rich in oil and gas reserves has become the focus of intense competitive interest among the big powers. Adding to the complexity of the situation is the fact that the existing pipelines pass through Russia which is both a partner and a competitor in the energy field in the region.

ENERGY rich Caspian Sea has attracted major countries of the world for exploiting the potential resources of Caspia. Moreover, the former Soviet republics of Azerbaijan, Kazakhstan and Turkmenistan which are also sharing the Caspian Sea along with Russia and Iran are asserting their sovereign rights after the Soviet break-up for the exploitation of oil and gas resources of this inland sea. Caspia has become a scene of game politics on an international scale. In particular, there has been active interest in the US and enhanced activity among the policy-makers, energy groups and academics on the Caspian Sea. For India which is one of the major importing countries of oil in the world market, current developments in the Caspian region should be of considerable interest. As Dennis Kirillov points out in an article 'Caspia Remains Sea of Unresolved Problems' in Moscow's *Finansavaya Izvestiya* (April 8, 1998) there is a realisation that Russia is losing its influence on the Caspian Sea and that it was necessary for Russia to retain the remaining power. Russia's influence on Caspia seems to have been affected on two counts - Russia's policy status on Caspia; and Russia's pipeline network connecting the Caspian Sea with the rest of the world.

Caspia's Status

After the Soviet break-up, differences have arisen among the Caspian Sea States (CSS) on the status of the Caspian Sea. Russia possibly wanted the Russo-Iranian treaty of 1921 and 1940 to be valid and hence Russia's contention was that the Caspian Sea should be exploited with the agreement of all littoral states without dividing the sea into national sectors. In this regard there was convergence of the position of Russia and Iran that both the sea bottom and water surface of the Caspian Sea be utilised equally by the CSS. But this view was not acceptable to Azerbaijan and Kazakhstan possibly because they accounted for 80-90 per cent of about 115-130 billion barrels of the proven oil resources in the Caspia (see table). On the other hand, the share of Russia and Iran are reported to be negligible. On the status of Caspia, Azerbaijan wanted to treat it as a lake dividing the sea into national sectors both the bottom of the sea as well as the volume and surface of water thus providing exclusive rights of the state. On the other hand, Kazakhstan wanted to divide Caspia on the basis of the 'law of the sea' thus providing division of only the bottom of the sea into national sectors (*Finansavaya Izvestiya*, April 8, 1998). Russia's 'collectivist model' for the exploitation of Caspia has not received favourable response from other states. According to Rajan Menon (1998), "Russia itself did not push the proposal aggressively due to bureaucratic infighting in Russia's fragmented state which made a coherent policy on the Caspia well nigh impossible". In the opinion of Kirillov, indecisiveness on the part of Russia's ministry of foreign affairs (MID) about the status of Caspia affected the interests of Russian firms.

Even as the status of Caspia was being discussed, Azerbaijan, Kazakhstan and Turkmenistan, exercising their sovereign rights, formed an international consortia and called for tenders for the exploitation of oil and natural gas. Azerbaijan formed the Azerbaijani International Oil Consortium (AIOC) which includes British Petroleum, Amoco, Pennzoil, Unocol, Exxon, Lukoil of Russia and Turkish Petroleum and the Azerbaijani state oil company, SOCAR. Azerbaijan also set up another consortia, the Caspian International Operating Company (CIOC) in which LukoilAgip, Pennzoil, Lukoil, SOCAR and Agip are the shareholders. Similarly, Kazakhstan formed the Caspian Sea Pipeline Consortium (CPC) which includes Chevron, Rosneft of Russia, Kazak State Oil Company, etc. According to some Russian reports, it was not represented in the discussions while forming the consortia although the fact remains that Russia's privatised energy firms such as Rosneft, Gazprom and Lukoil did participate in some of these international consortia.

Inability to arrive at the consensus among the CSS on the status of Caspia has often created problems for Russia. For instance, Russian firms Lukoil and Rosneft which participated in a major oil project had to withdraw from it since it was said to be located in an 'intermediate zone' which Azerbaijan called 'Kyapaz' and Turkmenistan called it 'Serdar' and both claimed rights over it and called for tenders for exploiting oil. In a similar way Russia called for tenders for exploiting oil in Sever (northern) zone in which Lukoil and Yukos(of Kazakhstan) participated. But it was later realised that it partly fell in the Kazakhstan sector.

In April 1998 Russia and Kazakhstan became 'shore brothers' after working out a preamble which ensures 'sovereign rights of both the countries for the use of sea bed' (*Finansavaya Izvestia*, April 29, 1998). An agreement to this effect was signed by Boris Yeltsin and Kazakh president Nazarbaev in October 1998 during the former's visit to Kazakhstan. However, Azerbaijan looked at this with indifference. The Turkmen president also seemed to be not in favour of the Russia-Kazakhstan position that the Caspian Sea bed but not its waters be divided into national sectors (*RFE-RL Newsline*, May 19, 1998). During the visit of Boris Pastukhov, Russia's deputy foreign minister to Baku in April 1998 a protocol was signed between Russia and Azerbaijan to divide the bottom of Caspia on the basis

Table: Oil and Gas Resources of Caspia and Central Asia*

Country	(Billion Barrels)			(Trillion Cubic Feet)		
	Proven Oil	Possible Oil	Total Oil	Proven Gas	Possible Gas	Total Gas
Azerbaijan	3.6-11	27	31-38	11	35	46
Kazkhstan	10-16	85	95-101	53-83	88	141-171
Russia	0.2	5	5.2	na	na	na
Turkmenistan	1.5	32	33.5	98-155	159	257-314
Iran	0	12	12	0	11	11
Uzbekistan	0.2-0.3	1	1.2-1.3	74-78	35	109-123

Note: * The energy wealth of Russia and Iran depicted in the table covers only their Caspian Sea zone.

of the 'middle line' and other norms of international law. According to Kirillov it amounted to a set back from the original position thus making for a loss of influence in the Caspian region.

Another significant issue that Russia has been facing is with regard to the network of pipelines for transporting oil and gas from the Caspian region. In the Soviet era, pipelines from Azerbaijan and Kazakhstan passed through Russia either for consumption within the country or for export. Hence Baku-Grozny-Novorussisk pipeline (known as the northern route) from the Azerbaijan capital to the Black Sea port in Russia was the route for exporting oil. For the Caucasian republic of Azerbaijan a pipeline passing through the neighbouring republic of Georgia would have been the nearest for exporting oil through the Black Sea. But the difficult mountainous terrain in Georgia possibly favoured the northern route. But more importantly in the past all decisions for production and transportation of oil and gas resources in the whole country were made in Moscow. The republics had hardly any say in the matter. Since the Soviet break-up alternative routes technically more hazardous, are being considered. In fact, political considerations have become more important. In Azerbaijan, Kazakhstan and Turkmenistan, oil and gas are the principal sources of revenue and exporting them to earn hard currency is vital for their successful economic transition. During the last 4-5 years, there have been many occasions when Azerbaijan and Kazakhstan have felt that Russia was using the pipeline to its own advantage affecting the interests of other Caspian Sea states. Russians have their own story to tell. A Russian analyst observed that for the Caspian states their national interest is top priority and the common interest of partnership with Russia is given a secondary place. An article in *Finansovaya Izvestiya*, April 28, 1998 observes that Turkmenistan proposed that Russia should purchase 20 million cu m of gas to be supplied to Ukraine through Russian pipes by paying 50 per cent of the cost in hard currency while Russia was unable to get $ 1 billion from Ukraine for gas supplied in 1997.

Western countries have also realised that Russia will have powerful leverage if they depended only on the northern route. The US, UK, etc, have strongly supported the opening of an alternative route passing through Georgia and Turkey to transport oil from the Caspian Sea. In a detailed study of oil politics in the Caspian region, Ariel Cohen (1996) has opined that after the Soviet disintegration, the Russian military and security services intended to restore Moscow's control over the region and over the pipeline routes (see map). In his view the US should not allow Russia to play a dominant role in Caspia as "otherwise Moscow will capture almost monopolistic control over this vital energy resource, thus increasing western dependence upon Russia-dominated oil reserves and export routes". Russia hence can be an equal partner in the development of energy resources in the non-Russian sectors in the Caspian region. Moreover, western oil firms want an additional and competitive source of energy supplies to the Persian oil to meet their future needs.

A somewhat different perception of the role of Russia in Caspia is to be seen in the observation of Federico Pena, US Department of Energy, that the US looked forward to co-operation and collaboration in the Caspian region through partnership with Russian companies. He also asserted that Caspia was strategically important for the US and that US companies were playing a leading role in the region. This is evident from the multiple pipeline strategy that the US has been promoting in Caspia, which in effect, reduced the role of Russia's northern route in exporting oil from this region.

In 1995, the AIOC decided to export oil through the western route (Baku-Supsa port on the Black Sea in Georgia) as well. Part of the Baku-Supsa pipeline needed to be reconstructed as it was worn out. But there was support for this proposal not only from Georgia which would be a beneficiary since the pipeline would bring revenues to the country, but also by western oil firms. The Baku-Supsa 700 km pipeline which is expected to cost about $ 1.1 billion is in the final stage of construction and is expected to be completed by October 1998.

Another western route has received wide publicity for transporting oil from Azerbaijan to the western markets, and that is the proposed pipeline from Baku to Ceyhan (port city on the north-east Mediterranean Sea in Turkey) passing through the territories of Azerbaijan, Georgia and Turkey. This 1900 km pipeline is estimated to cost about $ 3 billion. For obvious economic and political reasons, Turkey has been taking an active role in seeking western assistance for the route. Reports indicate that US policy-makers and oil firms have strongly supported this route. It appears that groundwork for this proposal was laid during the visit of Federico Pena to the Caspian states and Turkey in 1997. It is contended that this route will serve the national interest of the US in meeting part of its own energy needs over the next 25 years when global energy demand is expected to double. Moreover, the proposed pipeline, it is argued, will bring economic prosperity to young democracies of the countries of Caspia-Caucasia which will ultimately facilitate their political stability. A mea-

sure of great significance in this regard is that in May 1998 energy ministers of Turkey, Azerbaijan and Georgia signed a memorandum affirming support to the Baku-Ceyhan pipeline and that the presidents of the three countries are expected to sign soon. This will give a boost to US policy-makers and the oil companies of the western countries.

Russian firms such as Lukoil, Rosneft, etc, have been participants in Azerbaijan's international oil consortia of AIOC and CIOC enjoying 7-10 per cent share. But in the three latest contracts signed in May 1998 by the Azerbaijan government in the Kyurdashi field with proven reserves of 100 million tonnes, south-west Gobbustan field with 50 million tonnes and Kyursangi oil deposits, Russian firms are conspicuous by their absence, whereas Japan's Mitsui, Turkey's Tospo, US's Union TEXAS, and British and Saudi firms are represented. Azerbaijan's SOCAR firm holds 40-50 per cent of shares in each of the three projects (*RFE-RL Newsline*, June 3, 1998).

Kazakhstan is another important Caspian country with huge reserves of oil and gas. In the Soviet era oil from this republic was transported through the pipelines passing through Russia to Novorussisk port after the Soviet break-up, Kazakhstan has often experienced difficulties in exporting oil through this traditional route. Hence efforts have been made to find alternative routes to export oil and earn much needed hard currency. To avoid constraints of exports through Russia, Chevron located in Kazakhstan was sending oil from Tengiz oil fields to Baku by barge and then by rail to the Georgian port of Batumi on the Black sea bypassing Russia. In January 1998 an oil transshipment terminal was opened at the Azerbaijani port of Dyuband south of Baku for handling Kazak oil (Summary of World Broadcast (BBC) Former USSR, January 9, 1998). Kazakhstan explored another alternative route – a swap deal with Iran under which Kazakhstan sends oil to the northern part of Iran and in turn, Iran exports equivalent quantity of oil from its southern ports in the Persian Gulf. In addition to these alternatives, Kazakhstan had been considering an eastward route as China is a major market for oil. Prospects for this proposal possibly became brighter when Chevron started exporting Tengiz crude oil to the refinery at Urumqui in China's Xiniang region by rail. In turn, considering vast resource potentialities of Kazakhstan and its own energy needs, China has invested in Aktyubinsk and Uzen fields in western Kazakhstan. Further in February 1998, the Chinese National Oil and Gas Corporation (CNOGC) paid $ 320 million to Kazakhstan's Aktyubinsk Oil and Gas Company for 60 per cent of its shares. (*Kazakhstanskaya Pravda*, February 21, 1998). Rajan Menon comments that this proposed 6,000 km eastern pipeline involves a large investment and it was doubtful whether China could raise that much money and whether it could be commercially viable. According to some experts barring the distance factor, this eastern route does not involve any third country and would have fewer legal and political problems.

Notwithstanding these developments, Russia seems to have made efforts to retain closer links with Kazakhstan in the Caspian energy field. This is evident from the fact that Russia is one of the important partners in the 1,580 km Caspian Pipeline Consortium (CPC) which carries oil from Tengiz region to a new terminal near Novorussisk on the Black Sea which can export 67 million tonnes of oil per year. Russia's share in the CPC is about 24 per cent, Chevron 15 per cent, Mobil 7.5 per cent, etc. Equally significant is the fact that in January 1998 Russia's Lukoil and Kazak oil have entered into an agreement for joint drilling in the Caspian region which will make Russia's Lukoil the biggest investor raising its share capital to $ 740 million in seven major oil fields by the year 2000.

Turkmenistan is in a less enviable position. This is partly because Turkmenistan's proven reserves of oil are relatively less although that of natural gas are abundant (see table). But Turkmenistan is more dependent on Russia's Gazprom company which handles almost the entire transportation of 40 billion cubic metres of natural gas supplying mainly the former Soviet republics such as Ukraine, Georgia, etc. However, to increase exports to hard currency countries and to reduce dependence on Russia, Turkmenistan has been exploring alternative routes. In October 1997 Central Asia Gas Pipeline (CENTGAS) an international consortium was formed with the participation of others such as UNOCOL, DELTA of Saudi Arabia, and firms from South Korea, Japan and Pakistan to construct 1,271 km pipeline from Turkmenistan to Multan in Pakistan at a cost of about $ 2 billion. The construction is to start by December 1998 to be completed by the year 2001. As per some reports, it is envisaged, though very unlikely in the foreseeable future, that the pipeline could be extended to India with an additional cost of $ 600 million for an additional distance of 640 km. But this route has to pass through Afghanistan and the political situation in that country will be a critical factor. Turkmenistan has also been exploring another route towards China and Japan through Uzbekistan and Kyrgyzstan. This will be a 5,000 km long route which, according to some experts is economically less attractive. However, Turkmenistan seems to be more successful in exporting natural gas to Turkey via Iran after an agreement was reached in 1995 among the three countries. In 1997 US agreed to purchase about 28 billion cubic metres of Turkmenistan's gas via the Iranian pipeline. But the prospects of export of Turkmen gas to western Europe and the US may be affected as the US is critical about pipeline passing through Iran. In order to overcome such possible prob-

tems, as reported by Moscow's *Finansovaya Izvestiya* on April 28, 1998, Turkmen president S Niyazov met US president Bill Clinton in Washington on April 24, 1998 during which an agreement was signed for transporting Caspian gas with the US assistance.

All this is likely to reduce Russia's importance and hence its influence on other Caspian states. Therefore, realising this possibility, the former energy minister of Russia Valeri Garipov made persuasive arguments to convince western powers and oil firms that transportation by the northern route was twice or thrice cheaper than that of the western routes passing through Georgia, Turkey, Ukraine, etc. According to him Russia's Transneft ensures reliable operation of pipelines and high quality of transportation services and new technology to all clients including Azerbaijan, Kazakhstan, etc. Transneft has not only reconstructed pipelines passing through the Chechen republic but has also offered seven alternative equally economic routes bypassing Chechnya to ensure that ethnic conflict there does not affect Russia's interest. Russia's contention is that economic considerations should prevail over political considerations for the other Caspian states as also for the western countries (*Russia Business Watch*, Washington Fall 1997, p 32).

Georgiy Chanturiya, an official of the Georgian International Oil Company claims that the Azeri-Georgian (Baku-Supsa) western route will be the most economical for transporting Caspian oil to the Black Sea coast and hence advantageous to foreign oil importing partners.

There are differences in the perception and assessment about the economic viability of pipeline routes among the western oil companies. For instance, the British Petroleum, an important partner in the creation of the international consortium to develop Azeri off shore oil fields, is lukewarm about the proposed Baku-Ceyhan oil pipeline (*RFE-RL Newsline*, May 15, 1998) stressing that more than one pipeline would be used to export Azeri oil. In fact, the government of Ukraine and British Petroleum are making efforts to develop the Odessa-Brody pipeline. The Ukrainian government has proposed the setting up of an international consortium to complete the construction of Odessa-Brody pipeline and of the oil terminal at Odessa with an annual capacity of 12 million tonnes. In contrast James Tilley of the Caspia International Petroleum company, has implicitly supported the Russian viewpoint, that western firms should utilise the existing northern route which is the main export pipeline. While western firms have made huge investments in Caspia on the basis of vast potential reserves of oil, some analysts caution that expectations of huge potential reserves may not materialise. Apart from this, in the opinion of western experts on Caspia, there are problems of security for the pipelines which pass through several autonomous regions inhabited by ethnic groups which are politically sensitive – Chechnya in Russia, Meshketiya, Javakati in Georgia, etc. In the aftermath of the Soviet break-up, ethnic problems have often led to conflicts and violence.

Even as significant developments have been taking place in the energy rich Caspian region since the last six or seven years in which many countries are actively participating, India appears to be rather slow in taking interest, although developments in the Caspian region should be of concern to India as a major importer of oil. Recently, India has shown an active interest in the region particularly, Azerbaijan and Kazakhstan. For instance, following a meeting of the Indian delegation with Azerbaijan's president Heyder Aliev, India is set to participate in oil projects and have some stake in Ateshgyakh or Kyrdashi oil field (Summary of World Broadcast (BBC) Former USSR, February 6, 1998). In this regard the visits of the Indian foreign secretary K Raghunath to Baku and subsequently of the petroleum and natural gas minister V K Ramamurthy during the fifth international Caspian oil and gas exhibition in Baku in May 1998 in which ONGC participated are significant. It is important to note that India has maintained cordial political relations with all the Caspian countries. Moreover, India has developed technical expertise in the exploration and exploitation of oil and gas over the last few decades with the collaborations of the former Soviet Union. Therefore, it should be possible for India to utilise these advantages to successfully participate in international tenders being invited by the Caspian countries from time to time.

After the Soviet break-up, the Caspian region has become the venue of intense competition among the big powers reminiscent of the early 20 century Russo-British clash over Caucasia and central Asia. The stake is not geopolitical domination over the region, but indirect control over the rich energy resources of Caspia. Out of five littoral states of Caspia, only two states, Azerbaijan and Kazakhstan account for most of the proven oil reserves. In fact, the proven oil reserves in the Russian sector of Caspia are negligible although Russia is rich in its own right with reserves in other parts including Siberia far exceeding the reserves of Caspia. What has added to the complexity of the situation is that the existing pipelines pass through Russia. Making it both a partner and a competitor in the energy field in the Caspian region. Notwithstanding the present decline in oil prices in the world market, billions of dollars are being invested by leading oil companies not only for exploration and exploitation of oil in Caspia but also for finalising alternative routes to pipe out oil in the direction of the west and the east to reduce dependence on the existing northern route which passes through Russia.

For the newly independent Caspian states of Azerbaijan, Kazakhstan and Turkmenistan, the export of oil and gas to world markets is a major source of income, necessary for their economic survival. Perceiving that Russia may want to become a competitor rather than a partner for the development of energy resources, they have attempted to assert their sovereign rights, and have taken a position on the status of Caspia which is different from that of Russia. They have actively sought support and collaboration of several developed countries to invest in Caspia's energy sector which will also indirectly help them to strengthen their political stability and acquire international recognition. These Caspian states have maintained cordial relations with Moscow although the degree of interaction with Russia varies for each Caspian state.

In the post-Soviet scenario, Russia cannot expect to retain its original influence much less control over the Caspian region. Setbacks in Russia's policy on Caspia with regard to both its status and pipeline issues, may be partly attributed to the delay in accepting these realities. Russia needs to depend more on economic rather than political leverage to retain its influence in the Caspian region. But its ability to exercise economic leverage is limited by its own domestic economic compulsions and constraints and by the aggressive role of the major international oil companies politically supported by developed countries to control energy resources of Caspia. Being an oil importing country, India needs to play a more active role in the Caspian region.

India and Ongoing Review of WTO Dispute Settlement System

B S Chimni *

India should question the heads-I-win-tails-you-lose approach of the present rule-oriented WTO dispute settlement system whereby it is expected to strictly fulfil its obligations when more powerful states can avoid doing so through the incorporation of novel interpretive schemes or by using the national security exception clause.

I
Introduction

THERE is under way in the World Trade Organisation (WTO) a review of the Understanding on Rules and Procedures Governing the Settlement of Disputes (the 'DSU') adopted as a part of the Final Act Embodying the Results of the Uruguay Round of Multilateral Trade Negotiations (hereafter the 'Final Act'). The review process is to be completed in the next couple of months. It is of utmost importance that India does not merely raise technical and procedural issues in the review process but attempts to draw attention to the fundamental problems which characterise the WTO dispute settlement system (DSS) and suggest solutions which safeguard the interests of the Indian people. In this note I will, eschewing details, argue that India should, among other things, contend that the rule-oriented system which has been established by the DSU is of uncertain value to it and the rest of the third world and that it should be substituted by a system which gives greater weightage to national interpretations and determinations of rules which constitute the WTO regime.

Let me elaborate. There is a consensus among western researchers that the WTO DSS represents a move from a power-oriented system (as embodied in GATT) to a rule-oriented system. For example, according to Trebilcock and Howse "the Uruguay Round Understanding on Dispute Resolution seeks to advance substantially the legal orders conception of the GATT".[1] The incorporation in the DSU of the negative consensus principle is in particular seen as an important step in this direction. Its inclusion in the DSU ensures that the reports of WTO panels or the Appellate Body (established for the first time and viewed as the other significant step in establishing a rule-oriented system) will more or less be automatically adopted by the WTO Dispute Settlement Body (DSB) which is composed of representatives of all the member states. According to Article 16(4) of DSU, "Within 60 days after the date of circulation of a panel report to the Members, the Report shall be adopted at a DSB meeting unless a party to a dispute formally notifies the DSB of its decision to appeal or the DSB decides by consensus *not to adopt the report*". The same rule applies in the case of the adoption of a report of the Appellate Body. The meaning of consensus is stated in a footnote to Article 2 para 4: "The DSB shall be deemed to have decided by consensus on a matter submitted for its consideration, if no Member, present at the meeting of the DSB when the decision is taken, formally objects to the proposed decision". Read together Articles 16(4) and 2(4) guarantee that a report of a Panel or an Appellate Body will inevitably be adopted as it is difficult to imagine a situation in which a state winning its case before a WTO Panel or Appellate Body will vote against the adoption of the relevant report.

To the extent that the move to a rule-oriented DSS represents an attempt to establish the rule of law in the world of international trade it is welcome. For in a battle of briefs the less powerful countries in the international trading system have a better chance of having their views accepted than in negotiations openly visited by power. I will however dissent and contend that the move towards a rule-oriented system in the WTO is of uncertain value for the underdeveloped world, in particular India. First, a positive evaluation of the WTO DSS is sustained through viewing it in separation from the substantive rules which constitute the trading regime. Whereas the characterisation of a DSS as progressive or otherwise should depend on an assessment of the content of the rules which are to be interpreted and enforced. In other words, while a rule oriented DSS has some intrinsic value it is mistaken to believe that it automatically translates into justice in the international trading system. In the case of the WTO perhaps the contrary is true. Since the substantive rules essentially codify the interests of the dominant actors in 'international trade', a rule-oriented system only contributes to the rigid enforcement of the embodied inequities.[2] It also explains the paradox that the developing countries are making greater use of the WTO DSS than they did of the GATT DSS: it is a desperate search for fairness in the international trading system. While I am convinced that the fact that India has little to gain from the substantive rules is sufficient reason for rethinking its approach to the WTO DSS, I will not pursue this line of argument further here.

Indeed, I will concede that despite the bias of the substantive regime the rule-oriented DSS has the potential of hurting the principal actors in the international trading system. The problem however is that in certain key areas the rule-oriented DSS has been so constructed as to leave open vast interpretive spaces through which powerful states can safeguard their critical interests. For instance, as I shall argue in detail in Part II of the paper, concerned about the possibility that a rule-oriented system may on occasions prove inimical to the interests of even the most powerful state, the United States has contrived to include in the key agreement on anti-dumping special interpretive rules which all but ensure that WTO DSS will accept the determinations made by its national agencies. Needless to add, the anti-dumping provisions of the Final Act are very often invoked by the developed world against competitive exports from the third world to give protection to their domestic industry.[3]

The heads I win and tails you lose approach this represents is supported by certain other rules and procedures of the GATT/WTO regime. Of these I would like to focus, in Part III of the paper, on the national security exception clause contained in Article XXI of GATT for it has troubling implications for India in the post-Pokhran II era. Article XXI appears to allow states to justify the non-fulfilment of any WTO obligation in the name of national security. While the national security exception clause contained in it can be invoked by all states its use by dominant states is likely to have grave implications for the trade and security of other states in the international system. Policy-makers in India therefore need to take a close look at it.

In sum, I will attempt to look at certain aspects of the WTO rules and the DSS to contend that powerful states appear to have the best of both worlds in what is described as a rule-oriented system. On the one hand, a rule-oriented DSS allows these states to ensure that the developing-countries world fulfils their obligations under the WTO regime. On the other hand, the system is appropriately non-rule oriented when it addresses those areas where a rule oriented DSS could harm the interests of these states, as in the case of anti-dumping. The national security exception clause likewise allows sufficient flexibility to the powerful states to pursue unconstrained non-trade objectives.

If this analysis is correct then I would like to suggest that India should pursue in the ongoing review process a strategy which seeks to make the present DSS less rule-oriented as a whole. As will become clear in the course of my exposition, by a less rule-oriented system I mean a system which pays greater deference to the determinations and decisions of national authorities with respect to all the agreements which constitute the Final Act. To put it differently, the DSS must be made less rule-oriented not by restoring the previous power-oriented system based on the positive consensus principle but through redefining the meaning of a rule-oriented system.

II
Deference to National Governments and the Anti-Dumping Code

Among the key issues which arose in the course of negotiating the WTO DSU was as to how far panels should show deference to determinations arrived at by national agencies and authorities. A view was expressed by the United States that in the past GATT panels "had over-reached their authority and been too intrusive in disagreeing with national government authorities".[4] While perhaps the principal area of concern was past panel decisions on anti-dumping rules, the objection was framed by the larger objective of making the WTO DSS more deferential towards national interpretations of international trade obligations. Insofar as the specific problem of anti-dumping was concerned the Final Act conceded ground to those who felt that the GATT panels had been too forward in their decisions. Thus, Article 17.6 of the Agreement on Anti-dumping contains a most unusual provision from the standpoint of international law (as opposed to national law). It reads as follows:

> In examining the matter referred to in paragraph 5:
>
> (i) in its assignment of the facts of the matter, the panel shall determine whether the authorities' establishment of the facts was proper and whether their evaluation of those facts was unbiased and objective. If the establishment of the facts was proper and the evaluation was unbiased and objective, *even though the panel might have reached a different conclusion the evaluation shall not be overturned*;
>
> (ii) the panel shall interpret the relevant Provisions of the Agreement in accordance with customary rules of interpretation of public international law. *Where the panel finds that a relevant provision of the Agreement admits of more than one permissible interpretation, the panel shall find the authorities' measure to be in conformity with the Agreement if it rests upon one of those permissible interpretations.* (Emphasis added.)

The model on which this Article 17.6 is based is that of administrative law jurisprudence of the US.[5] It imposes serious constraints on the power of a WTO panel to question national determinations. Clause (ii) in particular compels panels to accept alternative interpretations of a provision of the agreement as long as it falls within the category of 'permissible' interpretations. However, as has been pointed out that unlike in the instance of US jurisprudence the word used here is 'permissible' and not 'reasonable'. The reason for this replacement is significant. According to Croley and Jackson this substitution was a result of a 'compromise' in order to accommodate those

> ...who wanted to ensure the effectiveness of many rules of the WTO, particularly those in the intellectual property area. These interests also believed that the "reasonableness criteria" would constrain panels too much, and make it difficult to successfully challenge objectionable practices that were inconsistent with various WTO rules.[6]

In other words, it was not certain at this stage as to whether the provisions of Article 17.6 would be confined to the question of anti-dumping and would not have general applicability. That it was so confined was because it was felt that allowing divergent national interpretations of the different agreements which formed a part of the Final Act could lead to undermining the DSS itself and prove counter-productive. In the words of Petersmann:

> An assumption of the legitimacy of diverging national interpretations could transform the WTO into a 'tower of babel' and conflict with the declared objective of the WTO dispute settlement procedures "to clarify the existing provisions of those agreements in accordance with customary rules of interpretation of public international law" (Article 3:2 of the DSU). This could undermine the declared objective of "the maintenance of a proper balanc of rights and obligations of member through "the prompt settlement of situ tions in which a member considers th any benefits accruing to it directly or i directly under the covered agreemen are being impaired by measures take by another Member" (Article 3.3 of th DSU).[7]

In the same vein Croley and Jackson writ

> Standing alone, that deferential review necessary to protect authorities' nation sovereignty fails to acknowledge that son balance between authorities' interest protecting their sovereignty, on the o side, and the broader interest in realisi the gains of international co-ordinatio on the other, must be struck. The argume proves too much, in other words, as unwittingly challenges the very rationa of the GATT/WTO itself.[8]

In their view:

> ...perhaps all that is required is that pane (including appellate panels) perceive a show sensitivity toward the issues involv when an international body reviews t legal appropriateness of national gover ment authorities' actions.[9]

This seems a reasonable view but ove looks, first, the politics of interpretatio It is difficult to imagine texts which a as filled with ambiguity as the agreemen which form part of the Final Act. It is the not difficult to imagine that over a peri of time the jurisprudence with which the ambiguities will, under the pressure non-compliance of key players,[10] be fill will tend to favour the dominant state But second, and more significantly, co trary to the impression that Croley a Jackson give, their view does not seek strike a balance between national a multilateral interests with respect to a areas of WTO operation. A close readi of their argument reveals that they do n seek to universalise the nuanced approa to the actions of national authorities b to insist that this be the case where issu like anti-dumping are concerned. On t other hand, it is the burden of my argume that countries like India should insist th this be the case with respect to all ob gations. Thus, India's interpretation of i obligations under the TRIPs Text (f example, of its Article 8)[11] should also b upheld as long as it can satisfy the 'pe missible' interpretation criteria. There a possibility of advancing this line argument for the ministerial conferen which adopted the Final Act took a sign ficant decision which was made a part the text of the Final Act:

> *Decision on Review of Article 17.6 of t Agreement on Implementation of Article of the General Agreement on Tariffs a Trade 1994*

Ministers decide as follows:

> The standard of review in paragraph 6 of Article 17 of the Agreement on the Implementation of Article VI of GATT 1994 shall be reviewed after a period of three years with a view to considering the question of whether it is capable of general application.

Currently, a general review of the WTO DSS is underway and offers the opportunity to India to argue for the universalisation of the applicability of Article 17.6 in order to safeguard the interests of the Indian people. I now turn to an analysis of the national security exception clause in GATT.

III
Interpretation of GATT National Security Exception Clause: Complete Deference to States

The relevant parts of Article XXI of GATT read as follows:

> Nothing in this agreement shall be construed
>
> (a) ...
>
> (b) to prevent any party from taking any action which it considers necessary for the protection of essential security interests
>
> (i) relating to fissionable materials or the materials from which they are derived;
>
> (ii) relating to traffic in arms, ammunition and implements of war and to such traffic in other good and materials as is carried on directly or indirectly for the purpose of supplying a military establishment;
>
> (iii) taken in time of war or other emergency in international relations.

The interpretation of Article XXI raises the issue of whether the WTO DSS has the authority to review a national security claim by a member state to refuse to fulfil certain obligations. This is a critical issue for, in the words of one scholar, "there is little doubt that Article XXI of the GATT employs a very vague concept; it is thus a far-reaching national security exception with broad potential for abuse. Article XXI is a possible threat to the delicate system of WTO/GATT rules".[12]

The International Court of Justice (ICJ) had in the *Nicaragua* case (1986) had occasion to consider a national security exception clause which was contained in Article XXI of the 1956 Treaty of Friendship, Commerce and Navigation (FCN) arrived at between the Unites States and Nicaragua. Article XXI of the FCN treaty permitted measures "necessary to protect [...] essential security interests". It is not widely known that the ICJ in its decision directly compared the wording of the FCN treaty with Article XXI of GATT and observed:

> That the Court has jurisdiction to determine whether measures taken by one of the parties fall within such an exception, is also clear *a contrario* from the fact that the text of Art XXI of the Treaty does not employ the wording which was already to be found in Article XXI of the General Agreement on Tariffs and Trade. This provision of the GATT [...] stipulates that the Agreement is not to be construed to prevent any party from taking any action which it 'considers necessary for the protection of its essential security interests' [...]. The 1956 Treaty, on the contrary, speaks simply of 'necessary' measures, not of those considered by a party to be such.[13]

It is clear from the opinion of the ICJ that it distinguished between an objective formulation ('necessary') and a subjective formulation ('considers necessary') and concluded that the latter removed the matter from its jurisdiction.

GATT practice also reveals that states are unwilling to have a panel, or any other body, review their invocation of the national security exception clause. For example, in 1982, during the discussion of the trade restrictions affecting Argentina for non-economic reasons the US representative stated that "the General Agreement left to each contracting party the judgment as to what it considered to be necessary to protect its security interests. The CONTRACTING PARTIES has no power to question that judgement."[14] The representative of the EC stated that Article XXI "constituted a general exception, and required neither notification, justification, nor approval, a procedure confirmed by 35 years of implementation of the General Agreement".[15]

However, despite the *obiter dictum* of the ICJ, and the views expressed by the United States and EC in the past, the language of Article XXI appears to offer the possibility of arriving at a view which takes into account both the concerns of a state invoking Article XXI along with that of affected states through focusing attention on the sub-clauses of clause (b) which appear to limit the freedom of states. This understanding is supported, first, by the fact that the CONTRACTING PARTIES of GATT in 1981 adopted a 'Decision Concerning Article XXI' which noted that Article XXI could constitute an "element of disruption and uncertainty for international trade" and affirmed that all parties affected action under it "retain their full rights under the General Agreement".[16] While legally speaking this decision did not offer an authoritative interpretation of Article XXI, leaving the question open, it does offer a preliminary view on the subject. Second, in a recent dispute between the EC and the US over the 1996 Helms Burton Act the EC appeared to contend that the national security exception clause is justiciable. The Helms Burton Act provides, among other things, for basis of claims in US courts against anyone who traffics in property confiscated by the Cuban government from persons who are US citizens. The executives of corporations who traffic in such property are to be denied entry into the US. Upset over this the EC, after a series of infructuous consultations, requested the establishment of a panel in October 1996. It claimed that the Helms Burton Act violated several provisions of GATT. The matter was however settled through diplomatic negotiations and the US and EU concluded a MOU on April 11, 1997 in which they agreed to suspend the proceedings of the panel. But there is little doubt that the EU was willing to challenge the national security defence which the US would have in all likelihood advanced if the case had proceeded before a panel. In brief, the move of the EC to request the establishment of the panel supports the view that the national security exception clause is justiciable.

But even if this view is accepted it will only be in the rare instance that a WTO panel will find against the state asserting the national security defence:

> Assuming [...] that in principle the panel has competence to decide upon the questions emanating from Article XXI of the GATT, it has to be noted that the panel's powers are severely limited and that the state concerned has a wide margin of appreciation; since security to a large extent is a question of perception and not of hard fact, it is primarily –but not solely – the state that is competent to determine the existence of an emergency in international relations.[17]

Thus, Article XXI harbours great potential for abuse. This abuse can have grave consequences for the international trading system when invoked by powerful states. While it may not be frequently resorted to, its use in critical situations can cause serious injury. India has already become an illegitimate target of Article XXI; it is the only defence that the US has to its imposition of sanctions after Pokhran II insofar as they conflict with their GATT/WTO obligations. And given the wordings of Article XXI India will find it difficult to have a WTO panel hold against the most powerful state in the international system.

IV
Conclusion

I would therefore like to reiterate the conclusion that India should question the heads I win and tails you lose approach

of the present rule-oriented WTO DSS whereby it is expected to strictly fulfil its obligations when more powerful states can avoid doing so through the incorporation of novel interpretive schemes or using the national security exception clause. There are, I must emphasise, other provisions of the GATT/WTO regime which I have not touched upon (the provision governing the trade-environment interface, the agreement on subsidies, etc) which likewise offer the space to the principal trading states to harm the cause of the underdeveloped world.[18] But that is another story for another time. For the present I would like to plead with those in charge of policy-making in this country to frame a negotiating and litigating strategy which allows the Indian people to protect their vital interests.

India would appear to have two options: either to argue in favour of making the present DSS more rule-oriented or to attempt to universalise the standard of review contained in the agreement on anti-dumping. I would suggest the latter course of action for the following reasons. First, it is doubtful if the system can be made more rule-oriented in view of its negative implications for certain critical interests of the dominant states. Second, it is unlikely that a WTO panel will find against a state invoking the national security exception clause. Third, strengthening the rule-oriented DSS is not in India's interests as it gains little from the substantive trade rules which the DSS will interpret and enforce. Fourth, it will have even less to gain from the envisaged agreements on investment, social clause and the trade-environment interface. Fifth, even when the WTO DSS decides a case in favour of India it will not always be easy to effectively enforce the same against the developed countries in the face of asymmetrical power relations. Sixth, the threat of unilateral retaliations is not ruled out in practice despite the establishment of the rule-oriented system. Consequently, India should argue in favour of the general applicability of the rationale which informs Article 17.6 of the agreement on anti-Dumping. It will stand to gain from a DSS which pays greater deference to the national interpretations of all the obligations undertaken under the WTO regime. It should therefore attempt to persuade the rest of the WTO membership that an imbalance between international obligations and domestic independence will undermine the GATT/WTO regime and the principles upon which it is based.[19] This should not be difficult to do when it is kept in mind that Article 17.6 applies to an issue area of which the following is said: "For all practical purposes, there is nothing wrong with dumping, as it is a normal business practice. The problem is anti-dumping".[20] Surely, the applicability of Article 17.6 cannot be withheld from the rest of the WTO agreements.

Notes

[This is a slightly revised version of a paper read at a Seminar on "Certain Aspects of the Functioning of the WTO Dispute Settlement Mechanism and other Allied Matters" organised by the Asian African Legal Consultative Committee along with the Ministry of Commerce and the Ministry of External Affairs held in New Delhi on November 17-18, 1998.]

1 M J Trebilcock and R Howse, *The Regulation of International Trade* (Routledge, London, 1995) p 397. Likewise, according to Petersmann, legal advisor to WTO:

> The progressive transformation of traditionally 'power-oriented' trade... policies into 'rule-oriented' policies constitutes one of the most important achievements of international law and policy since second world war. [Ernst-Ulrich Petersmann, *The GATT/WTO Dispute Settlement System* (Kluwer Law International, The Hague, 1997) p 84.]

2 Is it not surprising that at a conjuncture in international relations when one state, or at best a small group of states, dominate the entire international system that a rule-oriented system has been established. One would have expected the converse to happen. That it has not happened can only be explained by the fact that a rule-oriented system serves the interests of powerful states

3 Available data indicates a substantial increase of anti-dumping investigations since the mid-1980s Compared to the 1985-86 period the total number of investigations increased by roughly one-third from 178 to 237 in the 1991-92 period. Of the 1148 investigations initiated in the period the US (300), Australia (282) and the EC (242) led the way. A large number of these investigations were directed against third world countries. Norbert Funke, 'Trends in Protectionism: Anti-Dumping and Trade Related Investment Measures', *Inter Economics*, vol 29 (Sept/Oct 1994, pp 219-25 at p 220). The tendency to initiate anti-dumping investigations has, unsurprisingly, not subsided in the post-WTO period. A recent issue of *The Economist* (November 7, 1998) notes "the surge of anti-dumping cases" According to it, "the American government is encouraging anti-dumping suits, promising to vet them faster". What is perhaps new is that the developing countries have sought to retaliate in kind: " ..perhaps the most worrying new trend is that developing countries are retaliating with anti-dumping actions of their own. Mexico, Argentina and Brazil have launched a bevy of cases, many against the US. So has South Africa. And Asian countries are at last hitting back Anti-dumping actions are multiplying in China and South Korea India is setting up a new body to cope with an upsurge in cases", id But most developing countries are not in a position to seriously hurt their northern trading partners. Little wonder, as *The Economist* goes on to note of the US: "It is so keen on anti-dumping that it is loth to complain when other countries retaliate in kind"

4 Steven P Croley and John H Jackson, 'WTO Dispute Procedures Standard of Review, and Deference to National Governments', *American Journal of International Law*, vol 90 (1996) pp 193-213 at p 195

6 Ibid, p 199.

7 Petersmann, op cit, p 227.

8 Croley and Jackson, op cit, p 212

9 Ibid.

10 " ..an important question is whether the new dispute settlement procedures will work effectively. There will indeed be temptations of some member nations, probably the largest, to ignore or undermine the results of dispute settlement procedures when those procedures do not entirely suit their interests The dispute settlement procedure will lose credibility, and thus will fail in its primary purpose of establishing and maintaining a creditable 'rule-oriented' system " John Jackson, 'The World Trade Organisation: Watershed Innovation or Cautious Small Step Forward', *The World Economy* (1995) pp 11-27 at p 25

11 Article 8 of the TRIPS Text reads as follows:

> 1 Members may, in formulating or amending their laws and regulations, adopt measures necessary to protect public health and nutrition, and to promote the public interest in sectors of vital importance to their socio-economic and technological development, provided that such measures are consistent with the provisions of this Agreement.
>
> 2 Appropriate measures, provided that they are consistent with the provisions of this Agreement, may be needed to prevent the abuse of intellectual property rights by right holders or the resort to practices which unreasonably restrain trade or adversely affect the international transfer of technology.

How and Why Nehru and Abdullah Fell Out

A G Noorani

Selected Works of Jawaharlal Nehru, second series, volume 22 (April 1953 – June 30, 1953) edited by **Ravinder Kumar** and H Y Sharada Prasad; Jawaharlal Nehru Memorial Fund, distributed by Oxford University Press, Delhi, 1998; Rs 500.

Regional Security, Ethnicity and Governance edited by Justus Richter and Christian Wagner; Manohar, Delhi, 1998; Rs 380.

WHAT exactly was Jawaharlal Nehru's policy on Kashmir before he publicly ruled out a plebiscite in the state in early 1954? On the eve of independence, the AICC's stand, as declared in its resolution of June 15, 1947, was that "the people of the states must have a dominating voice in any decisions regarding them". In contrast, Mohammed Ali Jinnah asserted, on July 30, that the ruler would decide which of the two states to accede to "or to remain independent". When a dispute arose with Pakistan over Kashmir's accession to India on October 26, 1947 following a tribal raid from Pakistan, Nehru said repeatedly that the people would, nonetheless, decide the issue in a plebiscite. The two countries arrived at an "international agreement", to use V K Krishna Menon's words, on the modalities of a plebiscite in the form of two resoultions of the UN Commission for India and Pakistan (UNCIP) dated August 13, 1948 and January 5, 1949. On this basis a cease-fire was declared on January 1, 1949. The resoultions received the endorsement of the UN Security Council. They were never carried out.

From 1947 till 1953 Nehru was profuse in proclaiming his commitment to hold a plebiscite (A G Noorani, *The Kashmir Question*, Bombay, 1964, pp 33-68). On record also are the speeches of Kashmir's prime minister Sheikh Muhammed Abdullah from 1947 till 1952 which reflected a strong disapproval of plebiscite. The roles were reversed in 1953. The Sheikh began to look favourably on the proposal to Nehru's dismay; for by now Nehru had set his face against it contrary to his public stance. On August 8, 1953 Sheikh Abdullah was sacked from the office of prime minister of Jammu and Kashmir and put behind the bars along with some colleagues, chief among them being Mirza Muhammad Afzal Beg (vide his memoirs recently published in Urdu, *Khaak-e-Anjumand* edited by Mirza Mumtaz Afzal Beg, Rajbagh, Srinagar).

Documents which emerged in driblets revealed how the transformation came about in both Nehru and Abdullah The volume under review records Nehru's despair on the eve of the breach in August 1953.

The Nehru-Abdullah rift marked a turning point in the history of Kashmir. It had long been in the making. Yet the background is little known and less understood. Two factors caused the breach. Nehru's pressure on Abdullah to finalise the accession beyond doubt and the Jan Sangh-supported agitation in Jammu with which not a few among Nehru's colleagues sympathised. Earlier volumes of *Selected Works of Jawaharlal Nehru* record the drift towards the breach. Kashmir's Constituent Assembly first met on October 31, 1951. In a note to Girja Shankar Bajpai, secretary-general of the ministry of external affairs, dated September 18, 1951 Nehru opined: "the Constituent Assembly cannot decide finally about the accession of the state, though *it may express its opinion upon that or any other subject*" (vol 16, p 296; italics mine throughout).

At a press conference in New Delhi on June 21, 1952, Nehru discosed: "When the Constituent Assembly met in Kashmir for the first time I might inform you that it was its intention to pass a resolution forthwith confirming the state's accession to India. We asked it not to do it *so as not to be embarrassed before the United Nations.*"

What he did not disclose was that his opposition in 1951 was purely tactical and momentary and that he had since altered his stand. In a speech at a public meeting in Calcutta on January 1, 1952, Nehru said: "If, then, the people of Kashmir tell us to get out, we will do so...If tomorrow Sheikh Abdullah wanted Kashmir to join Pakistan, neither I nor all the forces of India would be able to stop it *because if the leader decides, it will happen.*" In August 1953 Abdullah was imprisoned for far less; he never favoured accession to Pakistan. Nehru asked "why would they [the people of Kashmir] live in a country where the Jan Sangh and the Rashtriya Swayamsevak Sangh are constantly beleaguering them? They will go elsewhere and they will not stay with us" (vol 17, pp 76, 77 and 78).

Pressure from New Delhi was constantly preying on Abdullah's mind. On April 10, 1952 came his famous speech at Ranbirsinghpura. Kashmir's accession to India would have to be of a restricted nature as the communal spirit still existed in India. While the government of India was trying to curb communalism, *unlike that of Pakistan*, it was none too successful. He did not equate the two. "So far as Kashmir was concerned, it wanted to preach the mission of secular democracy, both to India and Pakistan." Relying on a PTI report, Nehru commented on it publicly drawing a mild reproach from Abdullah on April 23. Nehru replied on April 25, in a long, rambling letter, with a reproach of his own in another letter of the same day in respect of Abdullah's speech that very day. Nehru was clearly over-reacting and eager to score points.

It was against such a background that Nehru and Abdullah concluded the famous Delhi Agreement on Kashmir's closer integration with the Union on July 24, 1952. The negotiations were conducted in a tense atmosphere with reservations on both sides (vol 19, pp 211-53).

Soon thereafter, Nehru bared his thoughts in a confidential Note to Abdullah dated August 25, 1952 while camping at Sonmarg in Kashmir. *He revealed his decision to reject a plebiscite as far back as 1948, his public statements notwithstanding.* Nehru formulated with cold, brilliant clarity his policy on Kashmir.

If NSC-68 drawn up by the US National Security Council was an accurate statement of its policy of containment of the Soviet Union during the cold war, Nehru's Note has the same historic significance as a statement of his policy on Kashmir. It was based on sheer *realpolitik*: treated the people of Kashmir dismissively ("... are not what are called a virile people. They are soft and addicted to easy living"); and ensured that the Indo-Pak cold war that had been launched in 1947 would con-

tinue, as indeed, it has for over half a century (vol 19, pp 322-30)

Well before the Delhi Agreement was signed, Nehru had met M A Beg, Maulana Mohammed Saeed Masoodi and D P Dhar in New Delhi on June 19, 1952 In a note he had then drawn up for the benefit of senior colleagues like Maulana Azad Nehru recorded "The point I stressed was that *even before they finalised their Constitution the relationship of Kashmir to India must be fully clarified* Once this was done the other matters would not offer much difficulty " He wrote to president Rajendra Prasad the same day that "in my talks with the Kashmir Ministers, I told them that the first question *to decide* and clarify was the position of Jammu and Kashmir state *vis-a vis* India" (vol 18, pp 403 and 405) Nehru obviously sought to finalise the accession and nullify the condition on plebiscite

Beg could not have failed to report this to Abdullah who thus, knew what the Delhi Agreement could signify *to Nehru* Now his Note of August 25, 1952 dispelled all doubt in Abdullah's mind

The Note presents a problem to a student of history on understanding Nehru s psyche For while in private he was for foreclosing all doubt and thus ending the dispute publicly he continued to go about as he had since 1947 speaking in the most extravagant terms of the people s will Vols 18 and 19 contain texts of his speeches in this tenor His speech in the Lok Sabha on June 26 1952 for instance ' it just does not matter what your Constitution says if the people of Kashmir do not want it it will not go there' If the plebiscite went against India he would accept the verdict and we would change our Constitution about it' (vol 18 p 418)

Nehru s Note of August 25 1952 made a startling revelation about his change of mind as far back as *in late 1948* The timing is very important Towards the end of 1948 it seemed to me that there were only two possibilities open to us (1) continuation of the war in a limited way, (2) some kind of a settlement on the basis of the then existing military situation I have not mentioned the plebiscite, because *it became clear to me then* that we would never get the conditions which were necessary for a plebiscite Neither side would give in on this vital issue, and so I ruled out the plebiscite for all practical purposes "

Why, then did he accept the UNCIP's proposals for a plebiscite on December 23, 1948? The Note explains his letter to the Sheikh soon thereafter on January 12, 1949 "You know well that this business of plebiscite is still far away *and there is a possibility of the plebiscite not taking place at all* (I would suggest, however, that *this should not be said in public*, as our bona fides will then be challenged)"

Nehru mentioned the period repeatedly Events had "led me to certain definite conclusions towards the end of December 1948 These conclusions were that the only possible way of putting an end to this conflict was by accepting, more or less, the status quo then existing " Unilaterally of course Thus while formally he had accepted the plebiscite proposals on December 23, 1948, in his eyes *their virtue lay in paving the way to a cease-fire* which would preserve "the status quo then existing"

Nehru defined the policy he proposed to pursue on Kashmir insofar as it involved Pakistan, coolly and with remarkable clarity of purpose

> We are superior to Pakistan in military and industrial power But that superiority is not so great as to produce results quickly either in war or by fear of war Therefore our national interest demands that we should adopt a peaceful policy towards Pakistan and at the same time, add to our strength Strength ultimately comes not from the defence forces but the industrial and economic background behind them As we grow in strength, and we are likely to do so Pakistan will feel less and less inclined to threaten or harass us, and a time will come when, through sheer force of circumstances it will be in a mood to accept a settlement which we consider fair whether in Kashmir or elsewhere The only danger is that the government of Pakistan, or some military clique there might in sheer desparation launch on an adventure

This arrogant misjudgment is responsible for strained relations with Pakistan to this day Even at Shimla in June 1972 Pakistan refused to accept partition based on the status quo Incidentally not a few of the ones who talk of rapprochement with Pakistan would yet refuse any serious concession on Kashmir

The other was his wilful neglect of the crucial factor – the people of Kashmir Nehru assumed (a) that the Sheikh alone represented them, and (b) that neither he nor his people would turn against Nehru's government When they did, Nehru adopted the same policy of reliance on force, imprisonment and rigged polls

Nehru reckoned with the democratic factor only to dismiss it

> Purely from the point of view of India's national interest we cannot agree, unless circumstances force us, to see this part of Kashmir state go to Pakistan There are no circumstances visible that can force us to do this Pakistan cannot The United Nations cannot override our wishes in this matter
>
> There is another aspect which we have stressed and which is important This is the wishes of the people of Kashmir If the people of Kashmir clearly and definitely wish to part company from India there the matter ends however we may dislike it or however disadvantageous it may be to India But, as I have stated above *I see no chance whatever of any proper plebiscite determining this question*
>
> So ruling out the plebiscite we have to accept *the present leadership of Kashmir* and the Constituent Assembly there as representing the will of the people of Kashmir If the Constituent Assembly told India to get out of Kashmir we would get out because under no circumstances can we remain here against the expressed will of the people As far as I know *the Constituent Assembly will not do such a thing and therefore the question* does not arise for me

He warned Abdullah

> *Doubts in the minds of leaders* percolate to their followers and to the people generally What is required is a firm and clear outlook *and no debate about basic issues* Personally I have that clear outlook *and have had it for these years*

Volume 19 also contains a transcript of his press conference on October 4 1952 at which he referred to the UNCIP's Resolutions We accept them still and we are perfectly prepared to proceed on these lines' This of course, was untrue

It is hard to reconcile Nehru's public utterances and, indeed his negotiations on plebiscite with UN mediators from 1949, to go no further till 1953 with his disapproval of debate or argument' on accession Were they for the record, for foreign consumption? Or was he simply confused? Also how is one to reconcile the Note of August 25 1952 with his agreement of August 21 1953 with Mohammed Ali Bogra, PM of Pakistan on a regionwise plebiscite in the state?

In truth Nehru was torn between *realpolitik* and commitment to democracy He opted for the former but was too intelligent not to perceive the vital omission ' What has sometimes worried me is what happens in Kashmir because I have found doubt and hesitation there and not clarity or vision or firmness of outlook'

He had Abdullah in mind not the people of the state Their mood was ever more distrustful of New Delhi This was a perceptive observation For by 1952 Sheikh Abdullah was a deeply worried man

On May 14, 1948 from Srinagar Indira Gandhi wrote to Nehru: "They say that only Sheikh Saheb is confident of winning the plebiscite...Personally, I feel that all this political talk will count for nothing if the economic situation can be dealt with. Because after all the people are concerned with only [one] thing – they want to settle their goods and to have food and salt." That still remains New Delhi's attitude towards them. Nehru's was little better. (Sonia Gandhi, *Two Alone, Two Together: Letters Exchanged between Indira Gandhi and Jawaharlal Nehru, 1940-1964*, Hodder and Stoughton, London, 1992, distributors B I Publications, p 551.)

As mentioned earlier, on January 12, 1949 a week after the UNCIP's plebiscite resolution of January 5, Nehru wrote reassuringly to Sheikh Abdullah: "You know well that this business of plebiscite is still far away and there is a possibility of the plebiscite not taking place at all. (I would suggest however that this should not be said in public, as our bona fides will then be challenged)" (S Gopal, ed, *Selected Works of Jawaharlal Nehru*, Nehru Memorial Fund, OUP, Second Series, Vol 9, p 198). On July 14, 1953 President Rajendra Prasad wrote to Nehru that according to the Vice-President, S Radhakrishnan, who had been to Kashmir the previous year, "*even Sheikh Abdullah thought that we would lose in a plebiscite as Sheikh Abdullah himself had told him that*" (Valmiki Choudhary, *Dr Rajendra Prasad: Correspondence and Select Documents*, Allied, Vol 16, p 90). Such a result could not have failed to affect Nehru's authority, if not, indeed, his tenure as PM.

Abdullah was able to end dynastic rule on Novemebr 11, 1992 and replaced it with an elected constitutional head of state 'Sadar-i-Riyasat', the maharaja's son, Karan Singh. By the end of 1952 the Jammu agitation was in full swing. Nehru was torn between pressures from the Jan Sangh leader, Syama Prasad Mookerjee, *and some of his own colleagues* and Abdullah's narrowing room for manoeuvre in view of the Jammu agitation, the rise of Jan Sangh and not least the growing alienation in the valley itself which affected Abdullah's own standing. Nehru gently reminded Abdullah, on January 5, 1953, of the need to implement the Delhi Agreement by appropriate decisions of Kashmir's Constituent Assembly so as to give it legal form (Vol 21, p 175). This was repeated on January 30. "Dhar told me that you were considering taking steps in regard to the implementation of the agreement..." (ibid, p 189). And, once again, on February 10: "That would partly disable any big agitation" (ibid, p 196).

Nehru would counsel Mookerjee to be patient (February 15, ibid, p 206) but patient he himself would not be. He wrote to Azad, in exasperation, on March 1, 1953: "I fear that Sheikh Saheb's mind is so utterly confused that he does not know what to do... My fear is that Sheikh Saheb, in his present state of mind, is likely to do something or take some step, which might make things worse...He talks about a complicated procedure for conforming to (*sic*) Delhi Agreement" (ibid, p 210). He meant its implementation, doubtless. Nehru had so taken Abdullah for granted that he missed the point that the Delhi Agreement was yet in force in Abdullah's perception.

Unknown to both, time was running out on it. Even for a person impatient of legalities and procedures, Nehru should not have looked askance at the reasonable, and by no means 'complicated', procedure the Sheikh had outlined in his letter of February 27 as summarised in a footnote – a Drafting Sub-Committee to give 'final shape' to the agreement for submission to the basic principles committee which was due to meet on March 5. Once the latter finalised the draft, he would "take immediate steps to send a copy" to Nehru. Part at least of Nehru's impatience stemmed from his passionate concern to finalise the accession, tell off the UN and Pakistan and get on with the task of governance interspersed with advice on moral behaviour to the rest of the world. Part at least of Abdullah's procedure stemmed from his desire to mark time and watch how events were shaping in New Delhi and Srinagar.

Volume 22 records that far from the breach narrowing, it became wider by the day; not least because of Nehru's growing impatience: "I do not myself understand why this particular limited matter of Kashmir's association with India should not *be speedily* decided...this matter at least should be tackled with speed *and settled*. I do not mind how long the rest of your Constitution takes." The tone was becoming sharper (pp 213-14). Abdullah had placed the Delhi Agreement before the Constituent Assembly on August 11, 1952. Nehru had done likewise in parliament on July 24.

An observation Nehru made in his letter to the Sheikh is of particular interest: "*My own view about the Constitution has all along been that it is always better to have a brief and flexible Constitution. We have made a mistake, I think, in having too long and complicated a Constitution of India and we are regretting it... it comes in the way all the time*" (p 214).

On May 18, 1953 members of the working committee of the National Conference took a fateful step. They were oppressed by the sense of uncertainty which had singled out their state in the entire subcontinent. Sheikh Abdullah took his colleagues into confidence and placed the matter before the working committee which met under his presidentship. The committee after prolonged discussions came to the conclusion that it was impossible to have internal stability so long as the state's future was uncertain. It accordingly appointed a committee consisting of the following eight members to explore avenues of a settlement: Sheikh Abdullah, G M Sadiq, Maulana Masoodi, Sardar Budh Singh, Mirza Afzal Beg, Pandit Girdharilal Dogra, Bakshi Gulam Mohammed and Pandit Shamlal Saraf.

Nehru, who was in Kashmir from May 23 to 25, was informed about the deliberations. Here is an extract from the minutes of the committee's final session held on June 9, 1953:

> As a result of the discussions held in the course of various meetings, the following proposals only emerge as possible alternatives for an honourable and peaceful solution of Kashmir dispute between India and Pakistan: (a) Overall plebiscite with conditions as detailed in the minutes of the meeting dated 4th June, 1953. [This apparently was a reference to Maulana Masoodi's suggestion that the choice of independence be offered in the plebiscite.] (b) Independence of the whole state. (c) Independence of the whole state with joint control of foreign affairs. (d) Dixon Plan with independence for the plebiscite area [regionwise disposition of the state].

Bakshi Saheb was emphatically of the opinion that the proposal (d) above should be put up as first and the only practicable, advantageous and honourable solution of the dispute. Maulana Saeed, however, opined that the order of preference as given above should be adhered to.

What G M Sadiq then said is worth recalling:

> If an agency consisting of India, Pakistan, Afghanistan, *Soviet Russia and China* could be created to supervise and conduct the plebiscite, I would suggest that *we should immediately ask for an overall plebiscite*. Failing this, we may ask for a supervision commission representing *all the Members of the Security Council* for ensuring free and fair plebiscite in the state.

Sadiq was close to the CPI.

In June 1953 Maulana Azad visited Kashmir and was apprised of these

developments. Early in July 1953, Nehru was informed about the decision (vide *Sheikh-Sadiq Correspondence, August-October 1956*, published by Mridula Sarabhai, New Delhi). Sheikh Abdullah quoted the minutes in his letter of September 26, 1956. Sadiq did not counter them. The editorial footnote is inaccurate: "Abdullah was said *(sic)* to have shown his preference for 'overall plebiscite or independence' while Bakshi Ghulam Mohammed and G M Sadiq differed substantially" (p 191).

Nehru found the proceedings disturbing as his letters to Azad and Girja Shankar Bajpai, both dated June 11, 1953, make clear. Azad was warned: "I am afraid Sheikh Abdullah will give us a good deal of trouble. He is acting very irresponsibly. I hope your visit will check him" (p 191). It, in fact, exacerbated the problem. Abdullah was reportedly discourteous to Azad at the Idgah.

It is, however, highly significant that Nehru was not disturbed by the stands taken by Bakshi and Sadiq, both of whom endorsed plebiscite as late as in June 1953 'emphatically' and 'immediately'. The minutes were sent to Nehru Clearly the two were dissimulating in order to deceive Abdullah They were in touch with Nehru. The circumstances suggest that he was not unaware of their conduct if not, indeed, privy to it

Meanwhile, in April 1953 the governor-general of Pakistan had dismissed Khwaja Nazimuddin from his office as prime minister and appointed in his place Mohammed Ali Bogra, till then ambassador to the US. Nehru made two comments about him. First, that he "is certainly keen on an agreement on various issues". They met in Karachi from July 25 to 27, 1953, having met earlier in June in London. The other comment Nehru made was that after the coup "Pakistan is now very much under the influence of the United States". Plans for US arms aid to Pakistan could not and need not have come as a big surprise to him

Two letters in this volume reflect Nehru's style of approach and his thought processes. One is a letter to Abdullah on June 28, 1953 One wishes he had gone to Srinagar as he said he might, since Abdullah would not come to Delhi. Nehru reminded him of his Note of August 25, 1952:

> This Note was discussed by us in Srinagar later and *I gathered from you and your colleagues that you agreed with that analysis and conclusion. Recent developments have, however, led me to think that you have either changed your mind completely or are not clear about your thinking.* This necessitates our understanding, as clearly as possible, what we respectively think. If one cannot agree, one should at least know precisely what the difference is. *That difference appeared to me considerable when we talked at Srinagar last.* But it seems to me that I could not get a grip of what you had in your mind, except negatively. *You told me that there were only two courses open for Kashmir, either full integration or full autonomy*, whatever that autonomy might mean. I did not agree with you in this, nor do I agree with you even now, because there are many other middle courses...

Surely, 'full autonomy' within the union was the very basis of Kashmir's accession to India in 1947 and 1949 in the discussions on Article 370 in the Constituent Assembly. Nehru added: "My government has stood, as you have so consistently stood, for a secular democracy. *I do not know what your feelings are on this subject now.* But I fear the tendency in Kashmir is away from it. Unfortunately that will have its reactions in India as such tendencies in India have their reactions in Kashmir." Nehru was wantonly giving a communal colour to a demand for autonomy. It was a wounding letter to one whose secular credentials were as impeccable as his own. Excerpts from Abdullah's reply are provided in the footnotes:

> Muslims may rightly feel that in spite of you and many others, the ideals of secular democracy are not much in evidence insofar as treatment to Kashmiri Muslims is concerned I derived my strength from what I supposed was an assurance that the state's accession with India would result in a fair deal to all sections of the people. But unfortunately that goal has not been achieved.

On the charge of lapses from secularism Abdullah retorted:

> May I say, this is an unkind cut Time alone will prove my faith in the principle for which I have consistently fought all these years My idea about secular democracy is not cramped or narrow-minded. I believe in justice for all sections of the people and my attitude is conditioned by realities and not by wishful thinking.

The Sheikh also wrote:

> You have spoken about guarantee. We certainly believed that the terms of the Indian Constitution provided adequate guarantee.. But I would point out to you the discrepancies that we came to notice from time to time in the attitude of the government of India in regard to this position. When Article 370 was devised, we felt assured by Sardar Patel that the Instrument of Accession would be the final basis of the Indo-Kashmir relationship. Subsequently, when the Delhi Agreement came up before the Council of States on August 5, 1952, Shri Gopalaswamy Ayyangar stated that Article 370 was *not* a permanent feature of the Indian Constitution and '*when the time was ripe' the provision could be wiped off the Constitution.* This clearly shows that even though assurances were given to us...such assurances came with a good deal of mental reservation.

Events were to prove that Abdullah's fears were fully justified.

Significantly, Nehru observed: "What I have felt lately has been that your government is very far from harmonious and in fact pulls in a number of different directions, that your organisation is also disintegrating in the same way". Abdullah replied: "I have not been able to understand your reference to disruptive tendencies both in the administration and in the organisation. All I can say is that it is baseless and probably the result of incorrect information given to you. I may, however, assure you that so far as the basic principles are concerned, there is no difference *of opinion among us in Kashmir*." The minutes supported him. Nehru sent a copy of his letter to Bakshi, but fairly informed Abdullah that he was doing so. In truth, it was New Delhi that was destabilising the state government by encouraging dissidence in the party. Abdullah was not aware of these intrigues evidently, least of all of Bakshi's liaison with New Delhi.

Nehru's letter to the chief minister of West Bengal, B C Roy – whose none too illustrious a record on secularism never earned him even the mildest reproach from Nehru – was written on June 29, the day after his letter to the Sheikh:

> It is difficult to speak openly about the injurious results of this movement. It has made the Kashmir problem far more difficult than it ever was. Before this movement was started, I had little doubt in my mind that the final decision about Kashmir would be in our favour, however long it might take. But this movement has upset all my calculations and weakened our position in Kashmir terribly I am for the moment talking about the Kashmir Valley only. As you know, the people in the valley are over 90 per cent Muslim. The reaction of the Jammu Praja Parishad movement on them has been very great. They have become frightened of the communal elements in Jammu and in India and their previous wish to be attached to India has weakened Indeed, at the moment, all the hostile forces against us

are dominant in Kashmir. The Pakistanis in Kashmir have taken full advantage of this and have even come out in the open for the first time. If Hindu communalists could organise a movement in Jammu, why should not Muslim communalists function in Kashmir? *The position now is that if there was a plebiscite, a great majority of Muslims in Kashmir would go against us.* In fact there has been some petty violence also.

Nehru added:

> The whole difficulty has been about the Valley of Kashmir and *we are on the point of losing it* because of the Praja Parishad movement. *Psychologically we have lost it and it would be difficult to get back to the older position.* You will appreciate how it has distressed me to see the hard work of several years washed away by this movement. *In the ultimate analysis, we gain Kashmir if we gain the goodwill of the people there.* We cannot keep it at the point of the bayonet if it is clear that the people do not want us. For the first time public cries are raised in Kashmir that the Indian army should get out.

Strangely enough when writing to B C Roy, Nehru was all patience and understanding of Abdullah's problems in contrast to his impatient letters to Abdullah himself. He wrote to Roy:

> It is true that if the Kashmir government had implemented the rest of the provisions of our agreement with them, this would have helped considerably. *But they were not given much of a chance. They started implementing it with the change in the Headship of the state. They would have followed with other provisions. But the first change itself was immediately followed by this agitation in Jammu and later outside. A new situation was thus created with which we have been struggling all this time and it became progressively more difficult to take any step in Kashmir of the kind we desired.* It is easy to criticise Shaikh Abdullah and I think that he has acted unwisely in many matters during the past few months. But the point is that we have continuously lost ground there and have fought what might be called a rearguard action in regard to the main problem of the Kashmir state...During the past few months, I have had no greater trouble or burden than this feeling of our losing grip in Kashmir.

Why did he not extend the same understanding in his direct exchanges with Sheikh Abdullah himself? Bluntly put, did Nehru have a split personality or was he being clever? Was he confused on cunning?

In the second quarter of 1953, both Jawarhalal Nehru and Sheikh Abdullah found their standings in their respective constituencies under threat. But there was a vital difference. Nehru was vastly more secure; when threatened he could always point to the danger from Pakistan. Abdullah's problem was far more acute. He found his popularity waning and pro-Pakistani feeling on the rise even in 1948 as Indira Gandhi testified to her father. The Delhi Agreement, if implemented, might spell his doom, he feared. Not without cause! In 1953 he was under attack from New Delhi, in Jammu and in Srinagar itself. His fingers on their pulse always, Abdullah *knew* that the people disapproved of his policy. His offer to Nehru of "full autonomy" (i e, cancellation of the Delhi Agreement) was the only alternative before him. Nehru could not sell it to India and was not interested in it either. By now both distrusted each other.

Nehru was impatient to 'end' the Kashmir dispute in 1953. Rather than patently deal with Abdullah, he chose to put him out of commission. The thought that he might use this opportunity for a dialogue with Pakistan now with Abdullah's approval did not enter his mind; it could not, given the mindset that produced the Note of August 25, 1952. Nehru used brute force to crush Abdullah and all he stood for and proceeded to follow the Note of August 25, 1952. In between he concluded an agreement with Pakistan for a regional plebiscite in August 1953 but soon resiled from it.

The point of no return for Abdullah and Nehru arrived in July 1953.

For the march of later and more fateful events we will have to wait for the next volume. Their consequences, however, stare us in the face today. They form the subject of Subrata K Mitra's essay 'Nehru's Policy towards Kashmir: Bringing Politics Back Again' in the volume edited by Richter and Wagner, two eminent German scholars. The volume comprises, besides, able essays on the MQM in Pakistan, the ethnic conflict in Sri Lanka, the political conflict in Bangladesh, which has split the polity vertically, not to overlook Partha S Ghosh's fine analysis of cross-border population movements in south Asia. Mitra's brief survey covers the years 1947-1986. His conclusions deserve wide notice in India:

> As long as they keep chanting the *mantra* that Kashmir is an integral part of the Indian Union on the basis of the Instrument of Accession and as a symbol of Indian secularism, India's policy-makers would stand dangerously exposed to the political and moral disapproval of the international political community. Nor is it any longer possible to make it a non-issue in internal politics: with the rise of Hindu nationalism, the earlier consensus has gone. In its place, there is a demand to strengthen the integration of Kashmir by removing Article 370, projected by the Bharatiya Janata Party and other parties of Hindu nationalism as the last obstacle to real integration. At the same time, ...it is politically inconceivable today for any political party to take the kind of initiative that Nehru was proposing towards the end of his life. India may not be able to impose law on Kashmir but she has demonstrated every will, and ability, to impose order. The tragic reality of the situation is thus that while the status quo is clearly far from ideal, the alternatives are far from realistic. The need of the hour is for quiet diplomacy based on legitimate interests of the conflicting parties as opposed to the rhetoric of plebiscite and the puerile argument of Kashmir as a guarantee of Indian secularism.

The truth is that after the Delhi Agreement of 1952, both Nehru and Abdullah found their popularity dwindling in their respective constituencies. Till then Abdullah was stoutly opposed to a plebiscite despite the fact that he had a most unpleasant experience of breach of faith practised by Vallabhbhai Patel, Abul Kalam Azad and N Gopalaswamy Ayyangar just before Article 370 was adopted by the Constituent Assembly on October 17, 1949. Had the agreed draft not been altered unilaterally, Abdullah's dismissal on August 8, 1953 would have been constitutionally barred beyond the slightest doubt (vide this writer's essay, 'Article 370: Broken Pledges and Flawed Secularism' in *Hindus and Others* edited by Gyanendra Pandey, Viking, 1993, pp 205-7). When Nehru pressed him to conclude the Delhi Agreement and thereafter to implement it while at the same time foreclosing all possibilities of a settlement with Pakistan by his note of August 25, 1952, Abdullah's mind turned to other options. It is a matter of opinion whether it was a bargaining ploy to set aside the Delhi Agreement or indeed to settle the future of the state once and for all. Nehru panicked and Abdullah was put in jail. In retrospect it is clear that we are in the mess we are in because Nehru had second thoughts on his promises to both the people of the state as well as Pakistan. He might have pulled it off had he allowed Abdullah's Kashmir to retain the status it enjoyed prior to the Delhi Agreement. Backing out of agreements with both Abdullah and Pakistan was, to say the least, unwise.

Bangalore as 'Silicon Valley'

James Heitzman

Bangalore has in the recent decades seen an explosive growth of not only the software industry but of a diversified high technology research and industrial base. More recently, infrastructural problems, among other developments, have prompted the reopening of the long-standing debate on the sustainability of this growth, which is examined in this paper from the perspective of high technology organisations that have been driving formal job creation in the recent past. Presented here are four short case studies of companies active in the field of information technology and services: one a large-scale public sector enterprise; three indigenous firms that originated as small-scale enterprises and two companies started by multinational corporations. The studies demonstrate the new challenges facing these companies and the consequences of the ongoing shift from an older paradigm of state intervention toward the new paradigm of entitled liberalisation.

THE city of Bangalore (city population 2.63 million, metropolitan area population 4.1 million in 1991), has been one of the fastest growing cities in India and has provided a congenial atmosphere for entrepreneurship since independence. During the late 1980s, the electrical and electronics industries in Bangalore experienced profound shifts in the ground rules of competition under the impact of 'liberalisation' and greater opportunities for interaction with multinational firms. There has been an explosive growth of the software industry, which has given Bangalore the title of the 'Silicon Valley' of India among business circles worldwide,[1] but software companies comprise only one facet of a diversified high technology research and industrial base. Analysis of the business environment and corporate strategies within a variety of technological niches is necessary in order to understand the dynamics underlying Bangalore's recent growth and the possibilities for continued expansion of the city's economy. A long-standing debate has questioned the sustainability of this rapid growth on environmental grounds, and state policy has attempted to encourage the location of industries in other areas in order to create multiple nodes of industrial strength. This article will approach sustainability from the perspective of the high technology organisations that have been driving formal job creation in the recent past.

Bangalore had a long history as a centre for textile production, originally through a variety of non-mechanised and decentralised 'putting out' arrangements, then through the introduction of large mills during the late 19th and early 20th centuries. With encouragement of the government of Mysore, other industries began to grow in the Bangalore area, and during the second world war the establishment here of a number of public sector companies, including Hindustan Aeronautics, caused the greatest spurt in population growth the city has ever seen within a decade. The industrial base of Bangalore thus rested, at independence, on the two limbs of textiles (home made and factory made) and public sector enterprises. These two limbs remain even today the most important parts of the formal economy in Bangalore.[2]

We may distinguish four phases in the economic history of the city since

---

For putting together this issue of the *RPE* with the focus on Science, Technology and Medicine we are grateful to Shiv Visvanathan who has penned the following general introduction to this selection of papers:

The study of science as a knowledge system still has no place in the university. What we have is Science Policy Studies which unfortunately is a reserve for retired or mediocre scientists happy to be extension counters of the current regime. Critiques of science have been more inspired by NGOs who have functioned as dissenting academics to the university. We decided to use *Economic and Political Weekly* as a floating academy, a forum for historical, social, philosophical studies of science, technology and medicine.

The current issue has six papers. The first by James Heitzman is an attempt to study the making of Bangalore as an information city. Heitzman began originally as an Indologist and is in fact an authority on the Chola period. His book *Gifts of Power* (OUP) is a study of Lordship in an Early Indian State. Heitzman now leads a parallel life as a computer and information expert. His essay is an evidence of his twice-born status.

Shambu Prasad's essay on cotton is an attempt to re-read its scientific and technological history. He shows how a certain view of commerce and an accompanying notion of technology created the tragedy of cotton in India. The second half of his essay demonstrates how Gandhian *ashrams* became research laboratories to redeem cotton. There are intriguing sections on Maganlal Gandhi and Richard Gregg.

The third paper is an essay on mathematics by the late Chhatrapati Singh. Chhatrapati was known more for his work on the philosophy of law and his researches into environmental law. He was also one of India's finest philosophers of science. This still tentative work on an Indian theory of numbers is evidence of the multifaceted nature of his work

Dhruv Raina is a historian of science. Along with his colleague Irfan Habib he has done much to revive the interest in the Indian mathematician, Ramachandra. Raina shows how the conventional history of science which creates a split between science and religion blinds one to the role of Jesuits in science. Raina provides a detailed understanding of the role of the Jesuits in the history of astronomy in India. It is a self-reflective work of a secular historian who looks creatively at the contributions of a religious group to the development of astronomy and its historiography.

The final paper by Shiv Visvanathan is a detailed study of the Lentin Report on the deaths in J J Hospital in 1986. Justice Lentin's investigation into the nature of responsibility became a classic report on medicine. Visvanathan analyses the extraordinary nature of the indictment.

independence. The first phase, during the 1950s and 1960s, was dominated by the government of India initiatives in locating public sector research and production facilities in Bangalore. These institutions still have a major impact on the city, the five largest public sector companies in 1991 officially employing over 81,000 people in their Bangalore plants.[3] Their direct impact, including management of their own townships, housing schemes, and transport systems, was supplemented by the numerous subcontracting opportunities they provided for small and medium enterprises. The second phase, beginning in the late 1960s and running through the 1970s, witnessed the rapid growth of state government bureaucracy, employment and eventually state-run businesses, helping to fuel the second largest spurt in the city's population growth during the decade of the 1970s. The third phase began during the 1980s, when Bangalore began to experience the effects of preliminary 'liberalisation' and private enterprises became growth engines, especially in micro-electronics-based companies. The fourth phase, beginning in the late 1980s, brought increasing and more varied relationships with multinational corporations.

The results of each of these phases still exist, inscribed in the physical space of the city and in the overall industrial structure of the metropolitan region. It is probable that the formal sector with the largest impact on employment is still textiles, if one includes the populations connected to silk weaving and cottage industries still visible in the old city and in Bangalore rural district. Next in importance are the public sector giants and the institutions of central and state governments. Although it is clear that business opportunities will remain in all these areas for the foreseeable future, it is doubtful that they will generate growth, employment or subcontracting arrangements that will keep up with the rate of population increase in the Bangalore metropolitan region. The growth of the economy will depend on the dynamism of private sector enterprises with high-value outputs, minimal environmental impact, and the ability to generate direct employment as well as indirect growth of services. The most likely candidates are micro-electronics-based companies in hardware and software production fields with a variety of connections with foreign firms.

This paper will present short case studies of companies active in the field of information technology and services, representative of the 'high technology' component in the industrial structure of the Bangalore metropolitan region. These cases include a large-scale, public sector enterprise, three indigenous firms that originated as small-scale enterprises within emerging technology markets, and two companies started by multinational corporations. These cases will demonstrate the challenges that have confronted these companies in the rapidly changing economic scenario during the last 15 years, and the shift that has been occurring from an older paradigm of state intervention toward the new paradigm of entitled liberalisation. The problems encountered by these firms and the strategies they have pursued for success, offer instruction on management strategy and public policy appropriate for the near future.

I
Indian Telephone Industries (ITI)[4]

The Indian Telephone Industries was established in 1950 in order to provide equipment to the department of telecommunications (DoT). Originally there were two units in Bangalore, but in 1973 ITI became a multi-unit organisation with plants in Naini, Palghat (Palakkadu), and Rae Bareli. Later, additional plants were established in Mankapur, Naini and Srinagar, and the second plant in Bangalore shifted to a 'model factory' in Electronic City. ITI had a large impact on Bangalore because of the large workforce employed there (the workforce in 1995 was about 11,000, including 4,000 in manufacturing) and its organisation of a complete township on the east side of the city and provision of extensive benefits packages for its workers, including housing facilities in multiple locations. ITI also offered lots of opportunities for subcontracting firms to grow up in the Bangalore area.

By the 1970s, political interference in this public sector company combined with retrograde technological decisions to cripple ITI's long-term competitive posture. The establishment of the Rae Bareli plant (in prime minister Indira Gandhi's electoral district) involved an investment of Rs 60 crore into crossbar switch production – embracing an already obsolete technology instead of collaborating with a foreign company to upgrade production of electronic components. The 1970s also witnessed the withdrawal of ITI from the export market, severely damaging its long-term market position. The main research wing until this time was the Telecom Research Centre in Delhi, which viewed ITI as a mechanical organisation with only technical experience in production.

The management of ITI took steps to upgrade its technological profile and modernise its management techniques. Chairman I K Gupta started research and development capacity in the mid-1970s. Chairman CSS Rao in the early 1980s insisted that the company grow its own managers and stopped additional recruitment. He tried to take ITI out of the ministry of communication and into the ministry of industry, the only acceptable alternative to privatisation at the time, but the move was quashed. KPP Nambiar introduced concepts of scientific management, corporate planning, and decentralised decision-making within the company. These moves were necessary because it was apparent by the mid-1980s that ITI would be operating within an increasingly competitive market. Competition for private area branch exchanges began as early as 1985; competition in the telephone instrument market began in 1987; crossbar production ended at the Bangalore plant in 1989. The pace of liberalisation increased after 1991 until 1994, when ITI found itself in a completely open market.

Although ITI was under pressure to develop locally or to indigenise modern equipment, it had regularly engaged in arrangements for technology transfer with multinational corporations.[5] By the mid-1990s ITI had technical collaborations with 16 foreign firms, including arrangements with ALCATEL for production of exchange equipment, with DSC Communications (Denmark) and AT&T for fiber optic systems, and with NEC Japan for microwave equipment. The tendency to rely on foreign collaborations, and the slow pace of development for switching technology appropriate to conditions in the country, was the stimulus for the founding of the Centre for the Development of Telematics (C-DOT) in 1988, and arrangements for transfer of its designs to ITI. During the 1990s, switch designs transferred from C-DOT were under production at Electronic City and Rae Bareli plants. The equipment produced by the main plant in Bangalore included digital switches, telephones, and equipment for microwave radio, coaxial cable, multiplexing, VFT channels, satellite communications, UHF/VHF systems, and fiber optics. ITI was rated 'excellent' for its performance according to a memorandum of understanding with the government of India from 1990 until 1994. In fact, until 1994 ITI

TABLE 1. PERFORMANCE OF ITI

	1984-85	1989-90	1993-94	1995-96
Sales and services (Rs in crore)	236 93	958.75	1,527.25	782 62
Profit after tax (Rs in crore)	15.51	29 48	84.35	-283.96
Total assets (Rs in crore)	362 64	994 55	1,494.34	1,173 15
Number of employees	30,126	32,334	28,633	26,272
Value added per employee(Rs)	54,997	153,401	268,708	104,244

continued to record acceptable growth statistics, having increased sales by 159 per cent and profit after tax by 286 per cent over a five-year period (see Table 1).

The crash came in 1994-95, when the company registered a loss of Rs 81 crore, but the situation became much worse the next year, with losses of Rs 284 crore. Net worth per rupee of paid-up capital declined from a high of 3.64 in 1994 to less than zero in 1996. Despite an increase in the quantity of equipment produced by 1996, its market value was significantly decreasing. Signs had appeared in 1993, with a 0.1 per cent decline in annual growth of the value of production, but the decline hit 35 per cent in the following year and 29 per cent by 1996. Export earnings declined from Rs 2.76 crore in 1994-95 to Rs 1.42 crore in 1995-96. ITI was not demonstrating an ability to compete in high-value market segments, but was still stuck with providing low-value products to a DoT that was diversifying its vendor base. During this period the company was without a chief executive officer for over a year.

One management response was to move away from the reputation of a strictly manufacturing company, redefining the business as full-service consultancy for telecommunications. With the division of the country into 18 telecom circles open to limited private competition in the mid-1990s, ITI could become a low-cost technology company offering bandwidth with technical expertise and decision support. The problem with this strategy was continuing opposition from its main customer, DoT, which blocked ITI's competition for basic services. Another management response was to downsize or 'right size' the company, lowering the salary and benefit bill in order to increase production costs for value-added manufacturing. Salary expenses in 1993-94 were Rs 186.73 crore and benefit contributions were Rs 22.28 crore. In 1995-96 these expenses had risen to Rs 203 crore and Rs 35.47 crore, despite reductions in the total number of employees. Expenditures on amenities for its employees, including maintenance of industrial townships, transportation, medical and canteen facilities, schools and social activities, parks and vegetable farms, amounted to Rs 66.66 crore in 1993-94 and Rs 76.75 crore in 1995-96. Labour unions and workers had fought bitter battles in order to obtain these wages and benefits,[6] and naturally responded slowly to management suggestions for dismantling this extensive system. ITI was already decreasing the number of employees by 1994 (see Table 1), and by 1997 the company had let go 4,000 workers through a voluntary retirement scheme (costing the company Rs 54 crore) and was planning to let go another 7,000 workers.[7]

ITI restructured itself into nine business groups targeting markets both inside and outside the department of telecommunications, such as defence, railways and electricity boards. A network systems unit was established in 1994-95 to position ITI as a provider of network services and value-added services such as email, paging, or voice mail. ITI formed a new company in collaboration with Korea Telecom for production of pagers, signed a memorandum of understanding with US-based James Martin and Company for software development and consultancy, and an agreement with the Swiss firm Ascom Energy Systems to manufacture power plants.[8] In 1993-94, ITI spent Rs 47.05 crore on research and development, but in 1995-96 expenses amounted only to Rs 33.35 crore, or 4.25 per cent of total turnover.

ITI began to turn around in 1996 under a new chief executive officer. Marketing, research and development again came under centralised management. Negotiations for technology acquisition from partners, which had involved one or two years, now concluded in six months. In-house subcontracting began to replace outsourcing. Regional marketing and customer support offices were reactivated. Losses in 1996-97 declined from Rs 284 billion to 51 million. A Rs 100 billion bond issue in September/October 1997 was oversubscribed and the company was expected to break even during 1998-99.[9] The survival of ITI, therefore, was no longer in doubt, but after the downsizing and the cutbacks in external subcontracting, it was no longer an engine for job creation in the Bangalore area.

II
Namtech[10]

KPP Nambiar began his career in England doing research on silicon semiconductors, including work for Transitron, a US corporation. He returned to India in 1963, worked for Phillips India and then helped start Tata electronics research and development capabilities in Bombay. In 1973 he moved to the Kerala State Electronics Development Corporation (KELTRON), where he became chief managing director. This corporation was the first of its kind in India, and served as the model for later innovations in other states including KEONICS in Karnataka. In 1985-86 he was chief managing director of ITI in Bangalore, where he oversaw the transition to electronic switching equipment. He became the secretary of the Indian government's department of electronics from 1987 to 1989, where he directed moves toward liberalisation.

His son, Padman 'Sunny' Nambiar studied at the University of Wales and obtained a degree in electrical engineering in 1980, after which he worked in Phillips Research Laboratories, Surrey, on projects systems integration, microprocessors and graphics. Returning to India, he began the Namtech group from scratch in 1984. The first organisations on the books were Namtech Consultants (NCPL) and Namtech Systems (NSL). In reality, NSL remained dormant for several years. Only NCPL, begun with absolutely no capital functioned as a platform for accumulating knowledge of local conditions and transferring technical, project and systems knowledge to the Bangalore area. The reasons for choosing Bangalore as a business site, in order of importance, were (1) the desire for a south Indian location to take advantage of his family's expertise: Kerala, the ancestral home with KELTRON ties, was seen as politically volatile and a poor labour market for technical personnel; (2) the nice climate (3) the labour base, with fewer union activities and cadres of workers eager to live there because of the climate and intellectual environment for technology. The business strategy followed from the start was to cultivate Indian markets for foreign electronics components until Namtech could introduce their own production regime and capture markets directly. Everything Namtech did therefore, was a strategy for technology transfer that moved fully-researched and operational production, created overseas into their own hands with indigenous markets already penetrated.

In 1986 NSL began marketing gas discharge tube surge arrestors for telecommunications equipment such as phone lines, primarily for DoT. This initial marketing agreement with CITEL France changed into a licensing agreement in 199[illegible] which included complete transfer of production processes with equipment from the US, France and Switzerland. In 1987 a $50,000 investment and a licensing arrangement with the Ronan Engineering Company of Los Angeles established a scheme to produce and market a line of eight separate instrumentation, control and testing products useful in a variety of industrial and power generation plants. Ronan received a royalty of $65,000 and 10 per cent of sales. The fabrication of these products, which used primarily foreign electronic components, was manpower intensive, which made assembly in India particularly attractive. For example the X-86 process instrument calibrator, sold to over 200 plants in India, required careful and time-consuming calibration in the factory before delivery. However, large casted components and mounting boards were subcontracted to firms primarily in Bangalore, to make use of the installed base of mechanical engineering firms near the plant. These outsourcing arrangements

were so successful, and the quality so high, that Ronan began to ask for payment in the form of casted components rather than cash. In 1994 NSL decided to discontinue four Ronan products but agreed to produce and market eight additional products, giving Ronan royalties of $90,000 and 10 per cent of sales.

The factory for NSL was located in a two-story building at Electronic City. The management here came from Kerala through contacts from the elder Nambiar's KELTRON days. KEONICS, which managed Electronic City, promised preferential allocation of electricity and water, but NSL experienced shortages typical of locations in the Bangalore region, including power outages up to four hours daily and water availability at about 50 per cent of requirements. These infrastructure problems necessitated the installation of equipment for electricity generation and uninterrupted power supply, and the boring of a tube well for water. The roads at Electronic City were also in very poor shape, giving evidence of construction with sub-standard materials and little if any maintenance.

With the expansion of the CITEL arrangements in 1990, the Nambiars created a new company, Namtech Electrical Devices (NEDL), and set up another factory down the road from the first plant in Electronic City. The new plant involved considerable investment in equipment, including a $1 million heating machine. The management here, recruited from Kerala as before, made great strides in just four years in the indigenisation of technology, inserting computers made at NSL as control devices and duplicating entirely some testing equipment and cast parts with locally-milled components. By 1995 Namtech began production at this factory of a new line of ceramic arrestors through arrangements with Suntech, a Japanese firm.

By the early 1990s Namtech had identified a market for thermistors in India, and began a search for foreign collaborators that ended in a marketing agreement with Bowthorpe, a British firm that was among world leaders in this technology. In 1994, with Namtech controlling 70 per cent of the market in India, they created a company for the production of thermistors in a new factory in Electronic City ready in 1995. This was a novel arrangement for Namtech, because Bowthorpe controlled 74 per cent of this company and Namtech 26 per cent, making Padman Nambiar into just one of many managers worldwide reporting once a month to a head office in London.

By 1994 Namtech was employing 100 people in the Bangalore area, of whom 35 were in three offices in the city in marketing, secretarial and accounting roles, while the remainder worked in two plants in Electronic City. With the addition of a new plant and expansion into new lines for control and telecom equipment, the company was expecting to double its work force within two years. Namtech maintained a van for transportation of employees to and from Electronic City, since traffic was terrible on Hosur Road during the rush hour. They were planning to build their own office locations off Hosur Road on the outskirts of the city to avoid the time-consuming commute. There was also an office in the city called 'The School,' which fronted as a training institute for multimedia computer applications. This was the place where most corporate presentations occurred for prospective clients, investors, or collaborators. In 1994 NCL was worth $700,000, $1.5 million, and NEDL $2 million. NEDL was first listed on the Bombay Stock Exchange for Rs 10 per share, which rose to Rs 100 per share by 1994; the Nambiars controlled 35 per cent directly or through NCPL. Capital invested in Namtech totalled $5 million, with $1 million post-tax profit.[11]

III
Infosys[12]

Infosys Consultants began in 1981 with an investment of $300 and with N R Narayana Murthy as chairman and managing director. The original purpose of the company was to make use of inexpensive but well-trained software engineers in India to provide offshore and onsite consultancy on corporate programming projects mostly in the US. The company was, in essense, a body-shopping centre that exported labour and expertise, and thus was a precursor of the many software houses, both Indian and foreign, that later grew in Bangalore. Infosys competed as a vendor offering turnkey contracts for software engineering projects; used the difference in time zones between India and the US to allow 24-hour productivity in maintenance operations, as customer and vendor teams were able to work in relays; and pushed the concept of the 'offshore software development centre' that functioned as an extension of a customer's software staff. During the first year of operations, revenue amounted to Rs 1.16 million and profit after tax was Rs 3,78,000. During the next 10 years, annual revenues grew to Rs 100 million.

By the late 1980s the management of Infosys predicted that enhanced competition for professional personnel within India, and increasing competition from firms in other developing countries, would eventually restrict growth in consultancy services. They therefore decided to move up the value chain by developing their own business software products in order to compete internationally within specific niche markets. The products developed by Infosys included the distribution management application package (DMAP), a suite of 600 programs designed for distributors of consumer products, used by Reebock in France; EAGLE, a warehouse management package used by Reebock in Russia; and BANCS 2000, an automated banking package installed at over 60 bank branches in India by 1995.[13] By 1997 additional products focused on client server architectures.[14]

During 1992 the Indian government's economic liberalisation policies were attracting more foreign companies that located software shops in Bangalore, competing for skilled personnel and potentially eroding the margins of the offshore consultancy operations. Infosys decided to invest capital in software development centres in India and to accelerate the move toward product development.[15] In 1993 the name of the company was changed to Infosys Technologies and there was an initial public offer of stock. A new corporate office in Electronic City, touted as the largest of its kind in the country and involving expense of US$7 million, was inaugurated in February 1995; in a 1,25,000 square foot building there were over a thousand networked computers running at speeds of up to 10 mbps, 30 servers, video conferencing and multiple 64 kbps communication links, and backup electrical generating capacity of 760 kilowatts. In 1996 Infosys terminated its arrangement with Kurt Salmon Associates and established a new wholly-owned subsidiary, Yantra Corporation, based in Massachusetts, for the purpose of marketing and supporting software packages developed by Infosys.[16] The new corporation purchased EAGLE (renamed WMSYantra) for US$10 million in the form of 50,000 equity shares.

In 1995-97 Infosys still derived 73 per cent of its revenues from software development or maintenance, and was continuing to innovate in these areas. For example, they landed a contract to supplement the computing staff of Nordstrom, a US-based fashion specialty retailer.[17] The In 2000 service was an extension of its long-term consultancy services to address the Year 2000 problem, but management intended to restrict this facet of the business to between 25 and 30 per cent of total sales revenue. Instead, the company continued to push development of its own products, and in 1996-97 invested over US$2 million (5.17 per cent of total revenues) in research and development (up from 3.40 per cent and 3.50 per cent in the two previous years). Revenues from its own products, which had risen to 23 per cent of revenues by

1997, were projected to cross 30 per cent by the year 2000. New products included BankAway!, an electronic banking product for the World Wide Web, and Websetu, a suite of tools enabling construction of Internet-based electronic businesses. PorteNT was a solution to port programs from the OS/2 or UNIX operating systems to Windows NT. The company now adopted a structure based on five strategic business units focusing on specific business domains, plus 10 groups dealing with specific products or management fields (eg, education, technology infrastructure, human resources). Infosys had eight development centres in India, six sales offices in the US and two in Europe. The revenues of Infosys grew from US$2.64 million in 1991 to US$18.11 million in 1995 to US$39.59 million in 1997, while net income grew from US$4,09,000 in 1991 to US$9.41 million in 1997, when the company was worth $550 million and had 6,526 shareholders. Infosys was still getting 87.12 per cent of its earnings from exports and 76 per cent of its business from the Americas, and thus stood as one of India's great success stories in offshore software consultancy and innovation.

One of the strengths of Infosys was its concentration on human resources and public service issues. In March 1997 the company employed 1,705 employees, labeled 'infoscions,' including 1,261 revenue-earning software engineers, and intended to hire 700 more; employee costs were 36 per cent of total income. After borrowing US$2.06 million from the Housing Development Finance Corporation (HDFC) in 1994, Infosys constructed quarters for some of its staff, and provided a small fleet of buses for transporting employees to and from the Electronic City offices. Infosys provided an attractive benefits package and cultivated a collegial, campus-like atmosphere complete with sports facilities and daycare at its main offices, in an attempt to retain trained personnel in a field where employees typically stayed less than three years. Five per cent of revenues were spent annually on employee training. Concerned about traffic problems on Hosur Road which led to Electronic City, Infosys donated Rs 8.78 lakh to the Bangalore Traffic Police for purchase of an ambulance and six motorcycles, and established the Infosys Foundation, a non-profit trust to promote social causes. Three social programmes had begun by 1997: 'Catch Them Young', which taught algorithmic thinking and programming to school children; 'Train the Trainer', an outreach programme to local academics; and 'Reach the Rural', which attempted to disseminate education in villages.

IV
Informatics[18]

N V ('Satya') Satyanarayana received his masters degree in Library Science from the University of Mysore in the mid-1970s and faced a standard career in special libraries. He worked as a library assistant in an Udupi college, then worked at the Indian Institute of Science before joining the library at Smith, Kline and French (later Eskayef). He began to conceive of a private company that would help provide databases that were currently unavailable in India: "It was here that I realised how starved for information Indian industry was. I began to see the tremendous possibilities this field had." Later that year he joined the library at Hindustan Machine Tools (HMT) and met Suryanarayana Rao, an accountant: "We both decided that this thirst should be quenched. That's what prompted us to tap this field which resulted in Informatics."[19]

Satyanarayana began Informatics in 1979 and incorporated the company in 1980. The original mission had a broad profile, including provision of library supplies (including furniture), trading, design, reprography and document delivery through manual searching. Initially he and his employees carried out searches for clients in well-equipped libraries around Bangalore, including the library at the Indian Institute of Science. There was a gradual focusing on institutions of higher learning and industries conducting research and development; at that time there were less than 300 research and development establishments in Bangalore (by 1995 the number had grown to more than 1,500). An important role initially was acting as a broker for subscriptions to journals.

Informatics began an informal relationship with Dialog Information Services in 1984, with access through telex. Business that year amounted to Rs 8 lakh, and included customers such as Tata Chemicals, the Gas Turbine Research Institute and the Defence Scientific Documentation Centre; most queries came from the pharmaceutical industry, followed by the chemical industry. By 1990, when Informatics formally became Dialog's international training and educational consultants for the south Asia region, they had serviced over 400 different clients; in that year Informatics gave out passwords to 62 out of 65 Dialog users in India.[20] In 1991 Informatics participated with Dialog in the introduction of KOMPASS ASIA/PACIFIC, a business directory of Asia-Pacific companies.[21] The job of Informatics was to create a mass of mostly business users for Dialog (and, after 1993, for Dialog DataStar)[22] through the sale of passwords and training conducted by an Informatics office in Bombay. In this role, Informatics organised in Bangalore the Infotex '93 Conference officially attended by 226 representatives of government and business.[23]

In 1990 the department of science and technology had entrusted to Informatics the jobs of identifying international scientific databases available online, and the creation of a database on parliamentary questions and answers on science and technology.[24] During the next year Informatics won a contract from the Developing Country Trade Agency (DECTA), run by the British Government's Overseas Development Administration, to set up an Export Opportunities Service (EOS) in India, providing potential Indian exporters with targeted market data and tender notifications. Another project was an arrangement with Predicast (USA) to develop a techno-commercial database on Indian industry and business by scanning leading financial dailies and journals.[25] It later worked with Reuters to supply Indian data for their databases, while between 1990 and 1995 Informatics contributed 23,416 records from six leading Indian newspapers and journals to the PROMPT database of Information Access Company, USA.[26] By 1991, in addition to Dialog, Informatics was providing corporate representation to six other major information vending companies and access to 10 international database systems.[27] In 1993 a new company, Faxon Informatics, emerged from a deal with the US-based Faxon Informatics, the latter holding 40 per cent (with an equity base of Rs 3,00,000) and Satya's company holding 60 per cent. After this 'fusion of leaders', all current projects except database exports and those associated with Dialog were turned over to the new partnership.[28]

One of the main problems in expanding the online business was the state of international telecommunications during the 1980s. Only in 1986/1987 did packet switching become available for international computer communications. In September 1989 a breakthrough occurred when Videsh Sanchar Nigam (VSNL) to set up the Gateway Packet Switching System (GPSS) in Bombay. Informatics co-operated with VSNL in establishing an online database service centre called Infotel, initially consisting of two computer terminals connected to the gateway switch and a library of software and manuals to aid database searching. Satyanarayana was highly critical of high tariff rates on international business calls from India.[29]

By 1990 there had been a dramatic change in the mission of Informatics. Although commissions on magazine and journal subscriptions still accounted for 65 per cent of a turnover of Rs 1.25 crore,[30] the company had shifted away from the

primarily at the information needs of people in industry, including managers, engineers, and others in positions of decision support who utilised external sources of information. For this purpose Informatics became more active in a variety of awareness seminars. In June 1990 Informatics celebrated its 10th anniversary by organising a seminar on 'Database Production and Distribution Industries for the 1990s', the first of an 'Annual Lecture Series on Telematics' that served as a major focus for the information society in Bangalore, bringing together in one place people from business, telecommunication and library communities. Satyanarayana repeatedly emphasised that his biggest problem was not the size of the potential market fors services, but an awareness among customers of the value of information. In 1989, at the inauguration of Infotel, he said

> In India we are still not an information-conscious society and that most decisions are based on feelings and emotions even at corporate levels. This tendency has proved to be very expensive for us. The object of Infotel is to change this culture and spread a new information culture to benefit decision-making processes in an effective manner.[31]

Satyanarayana noted that among the thousands of global databases available internationally there was not one from India. He called for an opening of the vast archives of data stored in hundreds of government agencies: "It's impossible to get the public domain data anywhere from India, as most of the labs and institutes are not sure of making them public".[32]

By the late 1980s, Informatics was one of the only private businesses in India attempting to market compact disk (CD) database products to the Indian market. In 1988 they tied up with Silver Platter, Inc from the US to provide foreign databases, and gradually used their connections with Faxon to introduce a wide range of CD products.[33] By 1997, the explosion in the Indian CD market, and the widespread availability of CD production technology in India, allowed the company to upgrade its own facilities and outsource CD production. One result was EXIM INDIA on CD, an 'electronic book' on Indian foreign trade regulations that provided reference to customs, excise, imports and exports policies, procedures and tariffs, with search engine and hypertext links.[34]

In 1995 the Dialog operation accounted for approximately 40 per cent of Informatics business, CD subscriptions and systems for 40 per cent, and the old periodicals provision for 20 per cent. The Dialog business was stagnant, however, and one year later accounted for only relationship with Dialog then ended in 1996. The decline and loss of the online business pushed Informatics into a greater emphasis on CD products and support. The company now included a CD-ROM division in Bangalore and a CD Tech division in Pune, involved in the systems integration work that was the biggest growth area. Consulting services providing complete 'document management' solutions for networked CD database systems, including hardware and software vending, installation and support, and CD production facilities. In 1995-96 growth was 40 per cent because CD products took off. Informatics employed about 75 employees, including four operating out of an office in Pune, three in Calcutta, and six in Delhi. But the advent at last of a new technological paradigm provided another challenge for the company. In 1997 growth was only 12 per cent because increased availability of the Internet, according to Satya, put a 'transitional lethargy' into purchasing, 'stopping people from buying information'. Informatics was poised to move into business on the Internet, but Satya complained bitterly of the continuing monopoly over Internet access exercised by the government that was choking online entrepreneurship.[35]

V
Multinational Corporations and 'Offshore' Software Facilities

The concept of Bangalore as a 'Silicon Valley' took off in the mid-1980s under the impact of Rajiv Gandhi's policy of economic liberalisation in several high technology fields, including electronics. There was an announcement in 1985 of a software technology park scheme, with special rules and concessions for 100 per cent export-oriented units (EOU). The first, and most influential, multinational corporation attracted at that time was Texas Instruments, which chose Bangalore because of the ability of technical personnel to work with English and to absorb training, a potential labour pool emerging from the Indian Institute of Science and other educational institutions, the already installed base of electronics industries and subcontractors, the attractive climate, and relatively cheap real estate. In a successful case of technology transfer, Texas Instruments set up a 64 Kbps data link and later turned it over to the department of telecommunications. This allowed the Bangalore team to develop and support software and transmit code online to the US and other locations globally (By 1994 the line was operating at 128 kbps).

The projects beginning in August 1986 focused on a Design Automation Division, where proprietary computer-aided-design ... of integrated circuits, including applications for simulation, testing, layout and verification. In mid-1988 TI India expanded its activities to include design of mixed signal integrated circuits and development of a wider range of software. In 1990 design activities began on application-specific projects (cell libraries, methodologies and support software for very large-scale integrated circuits) and memories based on dynamic RAM and non-volatile semiconductor technologies. An Information Technology Group began to re-engineer mainframe transaction-based applications for customers worldwide using proprietary computer-aided software engineering tools. TI India began in 1986 with 26 engineers, a total staff of 33, and revenues of US$.5 million. By 1994 it employed 230 engineers, a total staff of 270, and generated revenues of US$6 million. Unlike the original Silicon Valley experience in California, it did not generate new spinoff companies and did not land direct design contracts from customers, although by 1994 Indian staff were working on training and subcontracting links with staff from educational institutions in Bangalore, and a Corporate Venture Projects organisation was looking for new business based on TI's digital micro-mirror device.[36]

The image of Bangalore as 'Silicon Valley' was already established when Will Bailey of the Australia and New Zealand Banking Group (ANZ) had a conversation with prime minister Rajiv Gandhi on obtaining a license to buy Grindleys Bank, which had numerous offices in India. He promised, as part of the agreement, that ANZ would do something to reimburse India. This evolved into the creation of Index Computing, a wholly-owned subsidiary of the holding company ANZ International, Singapore.[37] The Bangalore office opened in 1989 as an export oriented unit with D Chaudhury, who had 22 years experience with ANZ, as managing director. It was part of an A$500 million investment in information technology in three sites (Melbourne, London and Bangalore) dedicated to software production. The original investment in the Bangalore operation was Rs 70 lakh, with a staff of 22 professionals.[38]

The first job was performing some low-level mainframe conversion work for ANZ. The second project involved re-programming of retail banking software for offshore offices purchased by ANZ from a UK company. Index initiated customisation and development that changed an obsolete banking package from an NCR platform to a database kernel running on a PC platform, introduced LAN connectivity, and set up interactive front ends that

allowed funds transfer, teller operations, statement storage, online data entry and verification. They attached a signature module that allowed digital scanning and presentation of photos, signatures and documents, and called the package BANC, which they marketed to banking and financial institutions worldwide for back- or front-end office applications. It became their core product that generated a major segment of income through the early 1990s. Other projects involved a minicomputer environment for source code production control products, trade finance products, research and development on handwriting capture software, and outsourcing work ('body shopping') for ANZ as well as firms in the Gulf States and Singapore. About 25 per cent of the outsourcing work was on HOGAN, a worldwide mainframe banking product. Sales increased 35 per cent between 1991 and 1992, and profit after tax increased from Rs 1.6 crore (US$.5 million) to Rs 3.2 crore (US$1.1 million), with a value addition of 73 per cent within the first three years of operation.

By 1991 the staff at Index reached 126 persons and was projecting a major expansion, when ANZ experienced major problems and underwent restructuring that included shedding of professional staff. In the opinion of later general manager John Pinnis, Index was 'hitting the wall' because it had reached a state of maturity that necessitated a focus on core business areas in distinction to an early tendency to take on all sorts of poorly-articulated projects with short-term dependence on outsourcing contracts. So by 1993 the goals changed to a limited technology set, specified ranges of customers, and limited products. Pinnis refocused business on the ANZ Group and a small set of key external customers who could provide front-end marketing and first-line service for Index products worldwide.

For initial operations there was an IBM AS-400 minicomputer with some work-stations in stand-alone mode. This changed by 1994 to a local area network with five servers and 100 nodes. Communication links until 1989 were dial-up through DoT phone lines, with no guarantee of access and a high failure rate. There was no digital exchange and legislation did not permit transfer of media, so product transfer involved physical movement of disks or tape. By 1990 Index had acquired a dedicated line that allowed voice, email and data transfer speed up to 9.6 Kbps through Group Data Network with leased lines from DoT and VSNL.[39] A 64 Kbps connection installed through DoT to Bombay with an uplink to a satellite made possible real-time computing after 1992. Five years later Index was developing a high speed data communications backbone for all its south Asia offices, including a triple level of redundancy: a base terrestrial system through DoT; VSAT connections between metropolitan centres run by vendors; and radio cellular links. Index was also setting up four customer service centres.

In 1998 ANZ Grindlays Bank had 56 offices in India, and Index was providing programming for all south Asian offices as well as technical services for South Asia and west Asia. Index employed 150 professionals, in addition to 15 more for Oracle/Unix and NT work in Bangalore and Chennai. The company had enough work to easily employ 250 people, but ANZ had limited its expansion. The 'Year 2000' problem was a massive issue for ANZ Grindlays, involving between A$150 and A$200 million of reprogramming. By late 1997 Index was devoting 70 per cent of its resources to this issue, leaving 15 per cent for new business and 15 per cent to file-and-fix operations. Index was tapping no external markets at this time, and had been turning down millions in contract offers annually. The strategy was to expand slowly but consistently. General manager Denis McGee expected a 'fourth wave' of demand for IT resources as organisations concentrated on built-up demand, so expansion in the industry could be dramatic.

The main advantages with the Bangalore location remained the schools, which were still churning out enough people so that for four jobs offered, Index was receiving 1,000 applications: and the operational cost differential, which in McGee's opinion was fast evaporating. Salaries were increasing at a rate of 20 to 25 per cent annually. Workers, especially in the entry level (less than three years seniority), would shift jobs 'for ten rupees'. There was a big drain to the US, Canada and Singapore, where banks and other offices would pay three times what Index gave and include numerous perks. The location of Bangalore remained good for ANZ operations, since it was cost effective to travel to and from Europe, Asia and Australia to deal with client problems.

The big problem was that hidden costs of operating in Bangalore were making it more difficult for multinational corporations to move into Bangalore, and McGee predicted that within a horizon five to 10 years in the future it would become as expensive to run operations there as it would be in Australia. Infrastructure issues were the big headaches, including poor water (they had to pay Rs 600 daily for two water lorries), power so irregular that they were running their generator eight hours a day with fuel costs rising 50 to 100 per cent annually. Parking was unavailable in their Cunningham Road location, and expenses of providing nice housing for the Australian personnel in India were escalating. ANZ was already exploring possibilities in other places like the Philippines.

VI
Corporate Strategy

Under the economic paradigm dominant until the 1980s, the structure of high technology innovation rested with a number of government-supported research establishments (the apex in Bangalore being the Indian Institute of Science) and with a limited number of large companies, such as ITI. In addition to their large internal labour forces, these companies relied on subcontracting of specialised components from a number of engineering and production firms, which were effectively captive to the market provided by the public sector. Thus Bangalore enjoyed a thriving subculture of small and medium enterprises connected by contractual arrangements to the public sector. Within protected markets, in the absence of intense international competition, there was a tendency for technology to remain one to three generations behind that available in north America, Japan or Europe. Agreements for technology transfer occurred primarily within large corporations which then transmitted design specifications for production, perhaps with enhancements through indigenisation, to internal units or to external subcontractors, who would then produce with minimal value added. An impressive level of growth and employment generation was possible within this business world that was large, but bounded and increasingly fragile.

The transition to a new paradigm was being completed in the 1990s, but it is clear from the cases examined here that it was underway by the early 1980s. The fate of ITI demonstrates in extreme form the impact of this transition on the public sector behemoths, as an inability to innovate or to explore new markets doomed the company to live on borrowed time until quite late, only to experience the fall out from market erosion and a bloated corporate culture by 1995. While the other big public sector firms in Bangalore did not suffer to this extent and made the transition more effectively, the overall result of these changes was job loss for employees in a downsizing phase and a slow-down or outright shrinkage in subcontracting opportunities for small and medium firms. There is little doubt that the big public sector companies will survive and (even in the case of ITI) grow at acceptable rates in the near future, but it is likely that their overall impact on the economy of the Bangalore metropolitan region will decline. This means that Bangalore must look elsewhere for models of growth and employment generation.

The cases of successful small and medium businesses indicate that they owe a great debt to the public sector for the training of their management. The debt is visible at least in managerial training through the Indian educational system, but is most obvious in the case of the originators of Namtech, who established an independent company that fed parts primarily to ITI. Entrepreneurs of this type of small business emerged from government-supported institutions and utilised their contacts there to understand emerging markets inside and outside those institutions in order to create new businesses. Many of the skilled personnel essential to the competitive advantage of these companies similarly had spent their early careers in the public sector, but migrated out in search of better wages and more interesting projects. The public sector was, in this sense, a stage in the assembly of capital and human resources that established a critical mass of market opportunities and people, allowing the emergence of an internationally competitive high technology.

These firms went through a stage of passive adoption of designs, inventions, tools or projects originating in foreign companies. This appears in the strategies of Namtech for capturing Indian markets with foreign-developed components, Infosys's beginnings as an exporter of programming talent for north American projects, and the growth of Informatics as a vendor of foreign databases. With Indian R and D and markets still in their infancy, the most effective strategy was to establish joint ventures for technology transfer or to accumulate capital by landing low-end contracts that brought in foreign exchange. Later, as personnal commanded up-to-date expertise and the Indian market matured, processes of technical indigenisation and market capture could occur. It was then necessary to move toward internal development of new, high value products applied to the Indian market in particular or to an international market. The management of Infosys in particular has repeatedly stated that the Indian software industry must move to this stage if it intends to continue growing in the long term.

A recurring theme in the cases examined here is the 15-year struggle between an emerging economic paradigm and government policy. For ITI the struggle ultimately concerned its own independence within an increasingly archaic model that defined a bounded field of technology and society and then allocated specific and unchangeable roles to organisations within that field – a model that was ultimately incapable of accounting for rapid technological or social change. A similar fate was in store for Informatics, which repeatedly encountered import restrictions based on obsolete understanding of technology and the Indian government's monopoly over telecommunications. The biggest problems faced by all these companies was basic infrastructure – water, power, roads, telecom facilities – which forced them to supplement or purchase these things on their own and to cut into their own margins.

The experience of Narayana Murthy from Infosys was particularly instructive. Infosys conducted annual strategic planning exercises and he was particularly concerned about the role of technology companies in the growth of the country and in the planning of their own environment. He had participated in planning discussions at the State Planning Board, the department of industries and commerce, and the Bangalore City Corporation. He was regularly confronted with meetings that led to no decisions and an inability of even the highest-level bureaucrats to access data structures that could describe programme status or alternative planning scenarios. The message he presented was that all planning activities require a coherent administrative structure based on dynamic systems models producing graphical output, allowing people to look at policy options and their impact on the city. This would require trained personnel devoting attention full-time to the relationship between information technology, systems and targeted planning outputs. A comprehensive vision of an extended time horizon, allied to effective budgetary and executive powers was necessary. A foreign firm with experience in this area, hired regardless of price, could provide the expertise in equipment and methodology and the ability to train personnel in India or abroad. Funding from agencies like the World Bank could link with this. He felt that the response of most bureaucrats was that this approach was either too sophisticated or too theoretical.

Three or four years earlier it appeared that Bangalore and Karnataka would receive lots of information technology investments, and during the period 1991 to 1996 there was an acceleration. By late 1996 Narayana Murthy noticed that fewer organisations were coming or showing interest. The apathy of the state government even in Electronic City, the lack of investment in infrastructure improvements, were reducing information technology inputs. The problem in the state government was that bureaucrats continued to point to the flow of projects coming into the area as proof that nothing was wrong, but many of these represented the implementation of schemes devised during the previous five years, rather than new projects. Under these circumstances, high technology firms faced with rising costs of doing business in Bangalore would look elsewhere. Even Infosys was looking seriously at alternative sites in China, the Philippines, Costa Rica and Barbados as places where they could relocate offshore activities, leaving Bangalore only as a co-ordinating centre for expanding operations. In his opinion, the metropolitan region had about five years time to turn the situation around, before irremediable shifts in capitalist tactics resulted in the abandonment of Bangalore.[40]

The expansion of the software industry has been a body-shopping exercise. The influx of multinational software firms, which contributed to the international currency of the 'Silicon Valley' epithet, began during the 1980s as an explicit move to exploit the cheap but skilled labour emerging from institutes of technical education, within an urban environment where the cost of externalities was still not high enough to offset the savings in personnel costs. By the 1990s some firms were making progress in moving away from this employment model and attempted with some success to create independent lines of products and services, but ultimately the continued success of offshore production in Bangalore rested on the ability of its firms to provide quality products at lower cost, which meant control over expenses for payroll and physical plant. The healthy, annual expansion of Indian software exports in any particular location thus relied on a fragile relationship between the local labour market and infrastructure provided by public institutions. Liberalisation has challenged government agencies to provide, at public expense, the services and labour that would allow private enterprises to operate with no guarantee that they would remain in one place. In the final analysis, planning decisions by public planning agencies have become crucial in the provision of services and infrastructure that allow the continued growth of the science city.

VII
Public Policy and Planning

Bangalore has enjoyed a long history of public planning.[41] In 1945 the City Improvement Trust had come into existence, eventually producing an Outline Development Plan from 1961 to 1976 for 500 sq km including 220 sq km of compact development. The Bangalore City Corporation (BCC), founded in 1949 with the combination of the municipality and the cantonment, created its own City Planning Board as well. In an attempt to co-ordinate the efforts of these two bodies, in 1976 the government of Karnataka brought them together into the Bangalore Development Authority (BDA) which took

eight years to come up with a Comprehensive Development Plan for 1986-2001, subsequently revised in 1994.[42] By this time the urban area had expanded to include almost all of the original 500 sq km of planned space. In response, the government of Karnataka set up the Bangalore Metropolitan Region Development Authority (BMRDA) in 1985, with authority to plan for a 'metropolitan region' including Bangalore urban district, Bangalore rural district, and one taluka in Kolar district; in practice this meant those areas not already covered by the planning activities of the BDA and BCC. It was not until 1995 that BMRDA was able to generate a preliminary 'structure plan' for the region.[43]

The restriction of planning activities within three agencies, each geographically nested within a higher office, should simplify decision-making and lead to co-ordinated policy and vision. There are several reasons why this has not happened. First, the state government established a variety of agencies for the provision of basic services (e g, the Bangalore Water Supply and Sewage Board, Karnataka Housing Board, and Karnataka Electricity Board), and a separate series of agencies for the encouragement of industrial development (e g, corporations for the management of industrial parks such as Electronic City) that have developed their own agendas, exercised independent control over sections of the urban periphery, and attempted to cut special deals with the service agencies. Second, the concentration of decision-making within state government agencies, a kind of 'colonisation' of public institutions by the state, divorced public policy from local conditions and from local constituencies. Fixing potholes in the road outside one's office became a tangled problem resolvable only at high levels in the state government Third, the potential for corruption in these conditions has become ever greater not only for members of the bureaucracy who act as gatekeepers for resources and services, but also for elected representatives who find opportunities to intervene within bureaucratic procedures and policies.[44] The further insertion of judiciary as a tool for furthering or blocking the programmes of government agencies has resulted in slowness and inefficiency in allocating land and resources.[45]

The direction of planning took a new turn in 1992 with the passage of the 74th Amendment to the Constitution, the Nagarpalika Act, which included among its provisions the requirement to create district planning committees and metropolitan planning committees The composition of these committees rested with the state government, but they required initial reconstitution of corporation councils and district panchayat councils, themselves reconstituted by the earlier 73rd Amendment.In September 1994 the government of Karnataka amended its own laws to accord with the 74th Amendment, and then embarked on a four-year process of redefining local election constituencies and powers of local 'wards committees.' During this period the future of the BDA and BMRDA and their relationship with either the service agencies or industrial development corporations remained uncertain, for their roles within the projected metropolitan council remained unknown and virtually undebated. BDA had accumulated a large staff and considerable power over its own planning area, but had a poor reputation and did not officially operate at the 'metropolitan' level. In the immediate aftermath of the 74th Amendment's passage, BMRDA expected its own demise, but as time went on there were indications that the state government might rework it into some new form of metropolitan council. Meanwhile, there were three chief ministers of the state within a three-year period, resulting in a discontinuity in leadership.

The result of these political changes was a period of five years in which there was little overall management of planning or vision for the long-term development of Bangalore. During this time there were clear indications that investment in infrastructure lagged behind growth of population and construction in the city and its environs. Furthermore, there was only limited success in attracting external sources of capital for implementation of infrastructure improvement programmes. As a result, the externalities associated with urban congestion and competition for services, combined with a steady rise in labour expenses, lowered the attractiveness of Bangalore as an arena for private investment. While the city still had advantages over other metropolises such as Mumbai or Delhi, it experienced more effective competition from Hyderabad and Pune. Because Bangalore was operating in an international investment scenario, cities in other countries were also in a position to offer more investment options or enhanced infrastructure to lure multinational corporations and new entrepreneurs, both foreign and Indian.

Bangalore has reached a stage in its growth where a new level of challenges face it and the entrepreneurs who may attempt to work there. As population continues to grow at a rapid pace – projections suggest a figure of seven million by 2010 – it is most likely that the economic growth necessary to support these people will have to come from the private sector, led by the kind of high technology companies discussed here. Their continued viability rests on improvements in infrastructure that will support current operations and enhanced functionality needed to co-operate in multinational co-operative settings. This infrastructure, in turn, ultimately rests on institutions and decision-making in the public sphere. The overall direction of planning is to place more responsibility for decision-making at the lowest operational level, a process we may describe as decentralisation or devolution – the most salient trend within management in the 1990s. This vector is apparent even within the Nagarpalika Act, which visualises local bodies at the ward level directing public investment and planning. Private enterprises will need to become more active at these local levels in providing inputs for their own services and infrastructure, and there are numerous examples in the Bangalore region of companies that have taken initiatives in their neighbourhoods with excellent results. Operating at the local level, however, is not sufficient for dealing with larger issues of regional planning, water and power, the allocation of space, and equity. These decisions require input within the larger institutional structures of municipal, district, and metropolitan councils, and are thus political issues.

Notes

[An earlier version of parts of this article is 'High Technology Entrepreneurship and Development in Bangalore, *Management Review*, 9 4 (October-December 1997), pp 85-96]

1 The voluminous literature on the Bangalore 'Silicon Valley' phenomenon dates back to the late 1980s and shows a remarkable durability in business publications Usually this literature lists the Indian Institute of Science and a few other research establishments, refers briefly to some public sector units, and then concentrates on multinational software outsourcing Typically there is then a critique of the environmental and lifestyle changes occurring in the 'Garden City' Lately, some foreign sources from the US have voiced a certain anxiety concerning the long-term impact of competition from Bangalore and India as a whole For a representative example, see Shirin Madon, 'Information-Based Global Economy and Socioeconomic Development: The Case of Bangalore', *The Information Society*, 13 (1997), pp 227-43 Yasmin Mahmood 'India's Silicon City', *Aramco World*, November/December 1997, pp 37-42, 'Hartetest im Paradies', *Der Spiegel*, 40 (September 29, 1997), pp 129-38, Edward Yourdon, *Decline and Fall of the American Programmer*, Englewood Cliffs, Yourdon Press, NJ, 1992, pp 279-312, William Wolman and Anne Colamosca, *The Judas Economy: The Triumph of Capital and the Betrayal of Work*, Reading, MA. Addison-Wesley, 1997, pp 83-106, Bob Davis and David Wessel, *Prosperity: The Coming Twenty-year Boom and What It Means to You*, Random House, New York, 1998, pp 218-17.

2 We should remember, in all these discussions, that the informal economy of the city probably employs larger numbers of workers than all formal sectors combined, although the value of its output may comprise a small percent-

age of the city's overall output. See P Thippaiah, 'Informal Sector and the Urban Poor in a Metropolitan Area: A Case Study of Bangalore', PhD dissertation, Bangalore University, March 1993.

During this period Informatics was also exploring the idea of producing CDs in their own facilities in order to capture and market Indian data. For this purpose the office in Bangalore was using a PC with scanner and a mastering machine (imported for Rs 2 lakh) to digitise business directories and newspapers.

34 The CD business regularly led to conflict with Indian government policy. When Informatics first brokered provision of CDs from overseas, the products were sent directly to consumers who had to pay customs duty. Officials were questioning whether Informatics was breaking customs laws by doing this, forcing Satya to spend a day's travelling to and from Delhi. For years Satya pressed for the inclusion of CDs in the Open Licence Scheme for import instead of classifying them as restricted items

35 Until 1997 VSNL operated as an Internet service provider with its own pricing system, but over a two-year period had attracted only 30,000 customers in India. VSNL also retained sole rights to grant licences to independent Internet service providers for Rs 10 lakh annually, but the department of telecommunications also required a licence fee for Rs 25 lakh. Under these conditions, which provided minimal bandwidth for an up-front expenditure of about $1,00,000, it was practically impossible for private providers to operate, and most Indian home pages were located on computers outside India.(*U&I: Informatics News*, 4:2-5 February-May 1997).

Suicide Deaths and Quality of Indian Cotton

Perspectives from History of Technology and Khadi Movement

C Shambu Prasad

The suicide deaths of farmers is a failure of agricultural science and the historical nature of the crisis needs to be appreciated. This paper seeks to retrace the route by which the present connections between Indian cotton and the mechanised textile industry were first established, a direction that has led to the present crisis on the fields of the cotton farmers. It also explores the alternatives in the khadi movement which with the aim of reintroducing spinning to the masses had to look at varieties of cotton suited for home-based production and evolve tools for use in the movement.

THE large-scale suicide of over 300 cotton farmers in Andhra Pradesh this agricultural season point to a crisis in the sustainability of cotton farming. One needs to go beyond analyzed causes like the failure of extension mechanisms, the unavailability of easy credit and the specific conditions of Andhra Pradesh, to understand the reasons for cotton becoming a highly risky and unsustainable crop. A longer-term view of the situation has to appreciate the historical nature of present day cotton farming and the concomitant loss of autonomy of farmers over what they are growing. The recent deaths of cotton farmers in Vidarbha, the shift to traditional varieties in north India, and the earlier event of suicides of farmers in Guntur and Prakasam districts in 1986-87, together with the present plight of the Andhra farmers, all point to a larger crisis in cotton farming that is systemic and not isolated.[1]

Despite repeated failures the cotton crop today requires high levels of pesticides and irrigated water. Although recent studies on the farmers suicides have pointed to the dependence of farmers on pesticide dealers and the increasing expenditure on irrigation, they have assumed these as inevitable for the crop.[2] The suicides point to a need for a cotton crop that would minimise the risk to the farmer and ensure sustainability for both the grower and the soil. There is therefore a need to reopen the debate between American and 'desi' varieties of cotton in the light of the well-known sturdy and pest resistant nature of the desi varieties. The agricultural establishment today grudgingly accepts the sturdiness of indigenous varieties, as is evident from the recent move to grow traditional varieties along the Indo-Pak border to prevent pests from entering India. This action however falls short of questioning the farming practices within India, where hybrid and American varieties dominate.[3] This paper looks at the history of cotton farming in India to examine the reasons for the neglect of desi varieties of cotton and thereby attempts to challenge its 'inferior' status.

Spinning in India is concentrated in a few centres like Coimbatore, Mumbai and Ahmedabad and the cotton trade has been following the pattern of trade laid down in the 18th and 19th centuries. The international trade determines prices and varieties grown, the benefits of which rarely accrue to farmers. Better returns for the farmer is possible if there exist decentralised cotton spinning technologies for value addition at the village or small towns. Alternative routes of production that could, by linking household textile production, local yarn spinning and the growing of cotton in small farms, perhaps provide the key for sustainable cotton farming. The needs of the mills today are incompatible with the nature of production on small farms. This paper seeks to retrace the route by which the present connections between Indian cotton and the mechanised textile industry were first established, a direction that has led to the present crisis on the fields of the cotton farmer. It also explores alternatives in the khadi movement.

There are three parts to this paper. In part I, we look at how the nature of cotton changed, with the change in the use from a raw material for a technology that could adapt to the widely differing qualities of local cotton, to one that had to service the machinery of the English industry and its production system, and how in this process Indian cotton earned the name of 'inferior' cotton. The reasons for the 'inferiority' of Indian cotton are then identified. In part II, the question of quality is explored in greater detail. We cite several instances from the history of cotton growing in India to challenge the notions of the poor quality of Indian cotton. We question the universality of the term, and hope to show that it has diverse meanings for machine made and hand made production, or export-trader based production and decentralised operations for local use.

In part III, we look at the khadi movement during India's freedom struggle, as a contemporary and alternative technological response to the developments in the modern textile industry. The khadi movement had consciously rejected some of the parameters of modern textile technology and thus provides an excellent case where some of the dissenting views on quality of Indian cotton in the accounts that were mentioned in parts II and I were actually applied in practice. The movement, through its scientists like Maganlal Gandhi and Dadabhai Naik, not only posited different definitions of quality more suited to the specificity's of Indian manufacture, but showed how a different science was possible where the field was on par with, even substituting, the laboratory, and where experience and memories counted as much as experimental facts.

I

The history of cotton growing in India since 1790, when Bourbon, the first exotic variety was introduced, can be seen as essentially one of the replacement of indigenous varieties of cotton, which had been carefully bred over centuries to provide the world's best cloths, by American varieties, to suit the emerging mill production of textiles in Lancashire. Consequent to the poor understanding of the difference of the two types of cotton, the indigenous was branded 'inferior'. While the 'deindustrialisation' caused due to colonial rule has been well researched, there is little understanding of the technical dimensions of this process. The cultural specificity of technological choices become clear if one examines the history of cotton growing in modern India and analyse how a technology that evolved over generations of practice was branded 'inferior' and replaced by another whose

technological merit remained unquestioned.

Cotton in India, unlike in other parts of the world, came into general use as clothing for rich and poor at an early stage in history. Cotton cloth reached a stage of perfection that made Indian textiles known all over the world and the textile industry gave employment to vast numbers of people at each stage of production. Different varieties were grown in different parts of the country, each being suited to the local soil, water and climate. While the cotton of Gujarat had long staples, the Dacca cotton was short-stapled, and yet it produced the finest fabric ever made. Since the cotton plant was so intimately related to the lives and occupations of so many people, a great deal of care had been given to their particular qualities and characteristics. Years of careful seed selection resulted in the improvement of the variety for the particular characteristics that were required. Length of staple, which today is the most important factor in deciding 'quality', was not important, in fact was even a hindrance when cotton was carded with a bow with longer staple cottons creating problems in processing by wrapping around the bow.

Europeans, in contrast, got involved in cotton as traders of cloth in the 17th and 18th centuries. They dressed in wool and linen, both of which can be converted from fibre to fabric by fairly simple processes. Their knowledge of cotton processing and its various techniques was limited. They were thus more in need of an 'industrial revolution'. Britain that was in the forefront of the industrial revolution initially got its cotton from Levant and West Indies for the most part of the 18th century. There was a spurt in cotton imports of Britain from 1780 onwards due to supplies from America and India, with America constituting the lion's share of Britain's imports of cotton thereafter. America became the biggest supplier of cotton to Britain from the 1800s and this continued till the 1850s when supplies were discontinued briefly due to the American civil war.

Cotton was not native to America. It was after nearly 150 years of constant trials and selection that cotton found its roots in American soil. Once it became acclimatised in the southern states there was a revolutionary change in America's fortunes. Initial expansion of cotton cultivation in the US began in 1786 with the introduction of Sea Island cotton into Georgia from the West Indies. By 1792, Sea Island cotton filled all the coastal areas of South Carolina and Georgia.[4]

Along with the possibilities of large quantities of cotton was the invention of machinery for cotton processing. Arkwright's spinning frame in 1769 increased the spinning potential of small manufactures. In the US the invention of the Whitney gin, in 1793, solved an important bottleneck in the speedy separation of fibre from seed. Of interest though is the fact that all the machinery was developed with just the American cotton. Length of staple thus became an important criterion for reasons of convenience of operation by machine and had little to do with the quality of fibre.

The over reliance on American cotton was of concern to traders in the 19th century and the manufacturers of Lancashire turned to the fields of India to increase supplies. The traders were not sufficiently aware of the situation in the fields of India and of the cultivation practices of Indian cotton, and presumed that they could replicate American conditions in India. But there was a huge difference between the virgin soils of the North American continent, and the soils of India, which differed widely, from place to place, needing regular manuring to maintain their fertility. Indian cottons were bred to withstand the vagaries of the variable Indian climate and cultivation practices were honed to minimise the cotton plants' vulnerability to pests. The traders were oblivious to these niceties; they wanted quantity production conveniently delivered at central points, to be conveyed overseas as efficiently as possible. For this purpose, the Indian varieties and trade practices were unsuited and so were branded 'inferior', and a systematic process of change initiated to mould them to the new demands. It was the trader's initiative to introduce new technologies, the ginning mills and baling machines.[5] The traders felt that large-scale import of American seed for trials in India and improvement in irrigation would help improve supplies from India. They also wanted the government to invest in other public works like railways and water carriage facilities to assist speedy transportation of cotton.

The government in its policy followed the demands of the traders and attempted to improve the position of cotton supplies by: (a) introduction of exotic seeds that would give high yields; (b) establishment of government farms to 'prove' superiority of exotic varieties and cultivation practices; (c) despatch of planters from America to introduce better cultivation practices; (d) introduction of machines for cleaning and pressing of cotton; and (e) Investment in public works for transportation of cotton to the ports and irrigation for increasing the yields.

Several reports were made on the subject of cotton growing in India to increasing supplies from India and removing constraints. Most were from government officials within specific areas such as the reports on the three presidencies, or on the Central Provinces and Berar, a major cotton growing area, where a cotton commissioner was appointed by the Manchester Chamber of Commerce. There were also reports and letters from traders in Britain, and cultivators – both Indian and British, as well as opinions of botanists. These sources have been used together for this section on history of cotton growing. We now look at some of the impediments identified that came in the way to see how many of these reflected on the quality of Indian cotton.

Supplies from India

Despite active governmental intervention, supplies did not increase as per expectations of the trade circles causing a lot of anxiety. Traders' reports and the lobbies were quick to identify this with poor infrastructure, namely, irrigation and transport. Indian cotton took the same time to reach the ports from the interiors as American cotton took to reach Lancashire.[6] They lobbied for railways for speedy transport and introduction of machines for ginning and baling. The railways would also reduce the adulteration of cotton in their opinion. The systematic adulteration of cotton at all stages on its route to the port with mud, sand, stones and water caused the cotton with dirt that as was as high as 25 per cent.[7] These reports did not look closely at the internal structure of cotton growing and textile processing.

Cultivators, both Indian and foreign, who looked at it closely however arrived at different sets of reasons. Primary among them were the poverty of the cultivator and the repressive rates of taxation. The high land tax came in the way of cotton growing, which in places of Gujarat were as high as 50 per cent of the produce.[8] Shamrow, a cotton planter from Dhoolia, found little reason for the ryot to pay heed to the crop that he had no say on. The cotton was left unattended in case the government 'kist' was not paid and deteriorated in quality produce.[9] Botanists who had experience of Indian agriculture and soils, also concurred with this view. In an evidence to the House of Commons Committee they had stated that the inferiority of Indian cotton to American cotton, was almost entirely owing to the neglect

of the cultivators. They did not see any inherent defect with Indian cotton in relation to the American.[10] In a few places where the ryot had more freedom his profits were better. Of the 13 districts on the Madras coast, only Visakhapatnam and Ganjam districts showed good profits, the reason being that the land there were under native chiefs.[11]

The poverty of the cultivator was in no small measure abetted by taxation that affected all aspects of indigenous cloth manufacture. This was in keeping with Britain's policy of converting India into a source of raw material and a market for finished products. The repressive regime of taxation made processing of Indian cotton prohibitive. Indigenous processing techniques, which were crucial, for the maintenance of quality of cotton came under strain and were eventually replaced by the faster, though qualitywise dubious, machines from the west. Brown, a planter who spent several years in the Madras presidency, describes it poignantly thus:

> The story of cotton in India is not half told: how it was systematically depressed from the earliest date that American cotton came into competition with it, about the year 1786, how for 40 to 50 years after, half of the crop was taken in kind in revenue, the other half by the sovereign merchant at a price always below market price of the day, which was habitually kept low for the purpose, how the cotton farmer's bullocks were taxed; the 'charkha' taxed, the bow taxed, and the loom taxed; how inland custom-houses were posted in and around every village, on passing which cotton, on its way to the coast for sale, was stopped, and like every other produce taxed afresh; how it paid export duty both in a raw state, and in every shape of yarn or thread, cloth or handkerchief, in which it was possible to manufacture it.

Brown commented that it was only in 1862, for the first time in 64 years that the annual tax on the loom was repealed.[12]

The cultivators felt that due to lack of incentives and the change in production system the cotton quality also suffered through poor picking and cleaning. The demands of the export market, however, did not allow for different pickings and all picking was done only once. In the absence of incentives for the ryot to improve the crop, it was often picked late leading to a fall in quality.[13] The care that went into the various processing stages for the indigenous industry were not complied with when there was a need to serve an external market. The traditional bow rendered the cotton as free from impurities as the most complicated machinery in England. As there were no incentive for gathering clean cotton the cotton that reached Britain was not bowed and was dirty.[14]

We thus see that in contrast to the traders' viewpoints that left the questions of prevailing trade practices unquestioned and instead blamed Indian cotton and cultivation techniques, the cultivators and botanists were of the opinion that no change was possible without improving the position of the cultivator and reducing taxes on the Indian processing implements. Another reason for poor supplies to Britain from India was the existence of extensive and strong local markets. In Punjab, even as late as 1884, when machine made goods had made inroads into the local market, 84 per cent of the cotton yield in the province was locally consumed.[15] Correspondingly the demand for American cotton amongst the indigenous manufacturers was poor. Colonel Skinner, a successful planter in Bengal had to abandon cultivation of American cotton because the produce did not fetch more in the Calcutta market than native cotton.[16]

None of the constraints outlined above point to any fault with the Indian cotton. It was to this that James Dunsmore, a retired cotton merchant, tried drawing the attention of the government. He wrote a series of letters between 1823 and 1827, on the issue of Indian cotton to the court of directors and brought to the attention of the government the essential difference between the Indian and American varieties on the question of quality, a difference that trade circles were unaware of. He contended that the superiority of Indian fabrics was as much due to the cotton as from the prevailing view that placed it on the skill of the Indian weaver, a view later confirmed by Hamilton in his study on the Dacca muslin. He argued that the soil and climate of most parts of British India gave a superiority to the quality of Indian cotton that no cotton wool of other countries could equal.

He remarked insightfully that the spinning machinery had been invented by people who had only seen American cotton, and so it was not suited to Indian varieties and wondered why the manufacturers using Indian cotton wool should not have discovered that its quality was both distinct and superior to their earlier ones. Dunsmore observed that "the manufacturers have no views beyond immediate gain, and in general want no change in the material because it would occasion a heavy outlay in new machinery". Dunsmore pleaded with the government to intervene and correct its error in policy but his letters remained unacknowledged.[17]

Cultivators who spent several years in India in cotton growing echoed Dunsmore's feelings on Indian cotton. These voices of dissent were ignored in government policy that favoured exotic seeds. We now look at the success of exotic seeds and experimental farms.

Exotic seeds and government farms with American cultivation practices did not work out in India. In 1816, the Bombay government in a letter to the court of directors, reported that the crop of Bourbon cotton had failed on the same spot where the indigenous plant produced plentifully. By 1837 the farm at Akra was considered a failure by the government's own assessment.[18] Fischer reporting on these experiments at Madras presidency considered "the American plant a delicate and unprofitable one" and not as productive as the common country or indigenous cotton. Gray, a planter in Madras, remarked that "The indigenous plant of India will not thrive well on any land except denominated cotton soil, while on the same soil the plants of the western world invariably fail".[19]

The cultivators were more forthright in criticising the efforts. Shamrow pointed out that while the government and commercial agents reaped all the benefits, the farmer got little in return for his enhanced trouble and expense. In his scathing comments on the experimental farms Shamrow remarked that the government "lavishly wasted vast sums of money (on expensive model farms) upon the sheer chimerical suggestions of would-be amateur experimentalist, and ignorant imbeciles...They (the experiments) were for the satisfaction of government, only, so that my countrymen remain, as before, unenlightened."[20]

Wight commented in detail about the work of the American planters, two of whom were sent to Coimbatore. The experiment, which began in 1840, went on for 13 years. He observed that in three years American planters had completely exhausted the fertility of the soil by cropping it with cotton year after year, making it unworthy of gathering in the fourth and fifth years. At the end of the fifth year, the planters retired from the field altogether, confessing candidly that they could not compete with the Coimbatore farmers. The Coimbatore farmers at the end of their 13th year of trial, produced from American seed a cotton crop as good and as abundant as was produced by planters in the first year and at half the cost.[21] The experiments had proved that Indian farmers were in no need of tuition from

Americans. However, in the absence of a guaranteed price, they were reluctant to take up the cultivation.

Opinion against exotic seeds was common by the 1860s. However, when Rivett-Carnac was appointed the cotton commissioner of Berar and Central Provinces in 1864, his main task was still to introduce foreign staples. In experiments at Nagpore, Carnac found that none of the plants of the Egyptian or fresh New Orleans seed could weather the heavy monsoon, whereas the indigenous could. Having realised the futility of efforts with exotic seeds he went about improving the indigenous cotton. He popularised the Hingunghat variety amongst farmers and merchants and conducted exhibitions in the cotton heartland to show the possibilities of improving Indian cotton. There were over 300 specimens of cotton exhibited from all parts of India and the world amongst which the Khandesh Hingunghat cotton was declared best ahead of the sawginned Dharwar cotton of American seed.[22]

Degeneration and Neglect of Indian Cotton

With the decline of household spinning in India, both the growers and weavers of cotton became the clients of the intermediary spinning mills. The import of machine-made yarn into India broke the connection between the cultivation of cotton, the spinning, and the weaving. Cotton which had largely been grown for local use, began to be grown specifically for export, and numerous textile producing centres decayed. The export market completely transformed cotton cultivation in India by setting up new criteria of quality for cotton It was now for the needs of the machine rather than for the cloth that could be made from it, that the characteristics were examined. Though desi varieties were well-known to produce the finest cloth, they were unsuited to the new textile machinery invented in England. Hamilton commenting on the cotton of the Dacca muslin observed that despite the greater fineness of cotton produced near Dacca, the American varieties have a longer filament and are thus more fitted for European machinery.

The damaging effects on cotton cultivation through promotion of research for the sake of trade was recognised by the well-informed George Watt, the botanical advisor to the government, who observed that due to the prevailing trading policies the progression of improvement of the indigenous staple was deliberately stultified and the labours of centuries ruthlessly thrown away. The existing trade, he felt was aimed against all the good features of the indigenous fibre. "The retrograde traffic is directed towards attainment of high yield of a worthless staple".[23]

The change in cultivation practices brought about by the colonial government led to the deterioration and loss of diversity of some of the best native species. The cotton that made the famed Dacca muslin had already disappeared. Traditional seed selection, manuring and cultivation practices of desi cotton farming died out, and traditional long-stapled varieties like the perennials of Gujarat and Kathiawar, were replaced by inferior ones. Bani, the breeding stock from which the famed Hingunghat originated, was replaced by Jari or Varadi, high yielding but low grade varieties that could grow even on inferior lands. Middleton in his *Handbook on Cotton in the Bengal Presidency* considered the popularisation of Jari and Varadi a calamity and a dangerous rival to the finer varieties. These varieties when brought to a new locality had robust growths, matured early, and were prolific. Once established, however, they degenerated.[24]

Watt had estimated that by a proper selection of seed and its cultivation, the cotton crop could be improved by 50 per cent. This had been suggested by other botanists: In 1886, Trevor Clarke and Jones, the superintendent for farms in western India highlighted the importance of the 'pedigree' system for careful selection of the seed. Colonel Showers had earlier in 1865 made several recommendations for the improvement of the indigenous plant.[25] Contrary to informed opinion in scientific circles on improvement of quality through changes in agricultural practices and introduction of quality indigenous seeds, the government sought to improve the quality of cotton mainly through legislation like the adulteration law of 1929 with a penalty of two years rigorous imprisonment for adulteration, that became more stringent with the Adulteration Act of 1863.[26]

By the time the government had realised the need to improve Indian cotton much damage had been done. Mollison, the inspector general appointed to improve Indian cotton, reported, in 1903, little practical results in improving the cultivation of Indian cotton. The reason being that the existing knowledge on indigenous varieties was poor and incomplete. He recommended that a survey be conducted of the existing cottons of India based on the suggestions of George Watt and that seed farms be established all over the country. Seventy-seven varieties were examined as a result at the three farms in the presidencies and their characteristics observed over a period of time. The results showed that the indigenous varieties had suffered deterioration mainly because of continued use of the same strain over generations.[27]

The scientific interest in the early part of the century was however not pursued in the field. The unhealthy practices of cultivation and trade continued unchecked. Though there was an increase in acreage between 1899 and 1939 from 13.8 million acres to 24.2 million acres, the quality of cotton grown was poor. The textile industry was undergoing rapid change. Britain lost its supremacy in textiles. Between 1885 and 1891, Continental Europe imported more cotton from India than Britain. Japan and the Indian mills were also serious competitors to the produce of Indian cotton. The Indian mills were yet to establish themselves and were concentrating on coarse manufacture and were not particular about the quality of cotton.

One would have expected a change in trend after India's independence and that the unfinished agenda of improvement of Indian cotton taken up vigorously. On the contrary, in a misplaced national zeal for self-sufficiency in long staple varieties, a crisis caused in part by partition which separated cotton growing areas from Indian mills, post-independence policies were shaped as a result directed towards import substitution of long staples. The focus was on high yielding varieties in irrigated areas in rich alluvial soils with large inputs of fertilisers and pesticides. Consequently there has been a shift towards hybrids and hirsutums because the desi (indigenous) varieties were unsuited to increased yields through artificial inputs. In 1947, 97 per cent of production was from indigenous varieties of the arboreum and herbaceum varieties. This decreased to 37 per cent in 1990, while that of hybrids and hirsutums went up from 3 per cent to 63 per cent.[28]

These changes were not due to market demands but due to a deliberate policy by the government that favoured certain varieties. A study team on cotton constituted by the National Commission on Agriculture envisaged a gradual increase in lower medium count but no increase in production in coarse counts for 25 years. It is thus little wonder that the price of lower counts of cotton have witnessed the steepest increase in price in recent years much to the distress of millions of handloom weavers making cloth for everyday use in local markets.[29]

The research conducted since independence has been on the same principles and

following the same direction as that established first by the East India Company and continued by the colonial government. Both policy and research favour the cotton merchants and big mill owners, at the cost of the small farmer and the weaver, or even the user of the end product, the cloth. The cotton, which now gets a high price, is the variety suited to the machine, not that which gives good cloth. Once it reaches the spinning mill it is made into yarn on the same machines that were developed from the early ones and intended for long staple cotton. There has been no research into different machines suited to desi cottons.

The present suicides of cotton farmers are directly linked to the policy of the government to favour those varieties that were amenable to huge inputs of irrigation, fertiliser and pesticides. It is becoming increasingly clear that such policies are counter-productive and unless there is a fundamental questioning of the basis of these like the inferiority of Indian cotton, these trends are unlikely to be reversed. A techno-historical audit of cotton technology can help us examine these axioms and replace them with others consonant with sustainable cotton farming. In the following section we critically examine one such axiom, namely, that longer staple length implies good quality cotton, an axiom on which Indian cotton has been branded inferior.

II

Textile Technology and Quality of Indian Cotton

Textile science today equates length of staple as determining the quality of cotton. Such a quality consideration fails in the case of the Dacca muslin, which produced the finest cloth in the world from the shortest staple. The Ponduru spinners of Srikakulam to this day are able to spin yarn as fine as 100 counts and above from cotton that is of short staple. These unexplained 'anomalies' in textile science raise some questions. Was the shortness of staple a limitation for mill machinery to operate? If so, what were the pre-spinning operations that were responsible for the high quality of yarn of Indian fabric of the past? Are they being served by present-day machinery? Isn't there a need for different quality markers for hand made and machine made goods? To answer these questions we look at some evidence from textile history on the quality of Indian cotton. This will help us examine if there is an incompatibility with Indian cotton and mill technology today and between American cotton and Indian hand techniques.

That Indian cotton could produce high quality yarn was a fact not unknown to the British. The cloth manufactured from the thread of Nagpore cotton was reported to last long, and to bear washing well. Hingunghat cotton was celebrated for its cleanness, strength, length, brightness, evenness and silkiness.[30] George Watt commenting on the peculiarity of the Dacca muslin cotton believed that the manufacturers of machinery had a lot to learn from the cotton and spinning techniques employed. He attributed the peculiar excellence of the Dacca muslin to its ability not to swell on bleaching.[31]

Several studies were made on Indian cotton in the 19th century in Britain and they give us some idea about the particular characteristics of Indian cotton. Clare's study comparing the threads made from Indian and American cotton through a microscope revealed that yarn made out of Indian cotton was much finer than the American. "It required, at least, four such threads of hand spun British India cotton twisted together to make one thread equal to the finest machine spun cotton in this country". He observed that the presence of moisture while spinning was responsible for the differences in appearances between Indian cotton and others. The hand-spun fibres had better adhesion and were thereby stronger and finer than machine made yarn. Briggs, commenting on Clare's and Wilson's studies, remarked that the "facts brought to light by means of these microscopic observations afford an idea of the delicacy of Indian cotton beyond anything of which we could have any conception". However he was quick to add, in keeping with the thinking of the times, that independent of fineness of staple, length of staple was of the highest importance in trade circles.[32]

Indian cotton today is used only for spinning lower counts so much so that desi cotton has become synonymous with coarse cloth. This was not the case before the advent of modern machinery. It is on record that yarn up to count 400 was produced. In 1868, when British goods and yarn had made sufficient inroads into the local markets and the spinning industry had almost died out in most parts of India, Rivett-Carnac was still able to demonstrate yarn of count 244 spun by the Dhers in one of his cotton exhibitions.[33] Indian cotton could also take dyes better. A calico printer of fine Swiss cloth realised that his colours were brighter when he used east Indian fabrics than British. Dunsmore attributed this to the presence of essential oils in Indian cotton that the American cotton did not have. Tests with indigo indicated that Indian yarn took colour better.[34]

During the 1860s when the British authorities were concerned about the lack of demand for British goods in the Indian market, they commissioned a survey on the slackness of demand for European goods. The survey report revealed that "Indian cloths contained more cotton and less sizing material than their imported substitutes, and were, therefore preferred. The native article was more durable, thicker, warmer and better suited to the wants of the people in the area."[35] Indian cotton has a larger diameter to compensate for the shortness of staple. The greater elasticity of Indian cotton provided for a cavity for easy passage of air making cloth from Indian cotton more absorbent.

Despite these attributes one of the reasons for the British disfavouring Indian cotton was because the cotton that arrived in Liverpool from India came in a highly contaminated state. When this cotton was processed in Britain injury to the staple was high. Whitney's saw gin was used for ginning and was seen as an improvement over the roller gin because of speed of operation. It was on account of the saw gin that length of staple became important. The longer the staple the more was the chance that even if it broke in processing the remaining pieces would still be long enough to engage in the machine. In contrast, the superior qualities of Indian cotton – fineness, silkiness, softness, durability and absorbency – are enhanced by low speed operations. Arkwright, the inventor of the first spinning machine, however knew only of long-stapled hirsutum of America. It is from this device that all modern spinning machinery is derived. 'Quality' in cotton fibre has thereby become dictated by the limitations of the spinning machine. As modern machines work at higher and higher speeds they need longer and stronger fibres, but the action of the machine itself weakens the cotton. All these qualities are sacrificed to the needs of a particular design of the spinning machine.[36]

The incompatibility of Indian cotton with machine processing in Britain becomes clear in the cotton reports of 1834. Several tests were performed on Indian cotton and Indian cotton was injured in almost all the cleaning operations. A closer look at the tests show that there was least injury to the staple when the foot roller was used, more injury when the charkha (hand gin) was used and maximum injury when the saw gin was used. When the

speed of the saw gin was reduced from 210 rpm to 90 rpm, the injury to staple was considerably reduced. This points to the fact that it was possible to devise machinery to run at lower speeds to suit Indian cotton. However, there was no attempt made in this direction.[37] In India modern ginning affected traditional cotton growing practices. These gins mixed different cotton varieties, good and bad seeds, serving as a disincentive for the farmer to grow good cotton as his best seeds were mixed up with inferior ones and he got an uneven seed mix in return. Watt pointed out that as a result, the Indian stock of cotton got degraded or equalised. He remarked that "the specialisation of centuries of natural selection was being rapidly effaced by this new phase of commercial production".[38]

The need for a different kind of machinery to suit the specificity of Indian staple received little attention. There was no substitute for the Whitney gin in India as late as 1860. It was only during the cotton famine that the court of directors declared an award of 100 pounds through the East India Association to stimulate mechanics to produce a suitable machine for Indian cotton. Of the few that finally worked, the Perker's gin was the most promising and initial tests indicated that it cleared five times more cotton than the native charkha without injuring the staple. It is not clear as to what happened to this machine. But the lack of reference to it in later texts indicate that the effort was discontinued.[39]

We thus notice that Indian cotton had several special attributes. It was more absorbent, more durable, took dye better, was capable of extreme fineness, had a lustre and was soft. On many parameters Indian cotton was more than comparable to the best cottons in the global market. Many of these attributes were enhanced by low speed processing, spinning, and weaving. The deterioration of quality in Indian cotton is thus also linked to the replacement of these techniques by faster machine made processes.

The attempt here is not to belittle any innovations that occurred in the modern textile sector but to point out that innovations are necessarily context specific. The kind of 'industrial revolution' that the indigenous industry would have undergone would have been of a vastly different nature. The machines and the modes of production would have perhaps been scaled down to suit the decentralised nature of production and the specific characteristics of Indian cotton. Quality would then have become intrinsic to the system instead of being imposed from outside. Quality in the Indian context would necessarily have looked into the quality of the linkages between the various parts of the whole rather than emphasising increases in productivity of individual parts of the industry.

The industrial revival of India that Gandhi sought for through the khadi movement in the 1920s had consciously rejected some of the established axioms of the textile industry. In introducing khadi, Gandhi and his followers were also attempting to establish a different textile science by placing faith in the axioms of indigenous cloth manufacture. The response of the khadi movement to colonial science and technology was not just a cultural response but also a technological response to the quality aspects of Indian cotton. The khadi movement sought to work out in the field the dissenting scientific agenda on the quality of Indian cotton outlined above. It is to such an indigenous industrial revolution that we focus our attention to in part III.

III

Science in Khadi Movement

Khadi (hand-spun, hand-woven cloth) needs to be resurrected today from its cliched usage of a symbol that got India its freedom. In the specific case of cotton technology khadi also has in it the seed of an alternative technological response to universalistic modern western science. By insisting on hand-spun yarn in decentralised manufacture Gandhi introduced a new dimension to the swadeshi movement. Swadeshi was no mere boycott of mill yarn but had to focus itself on providing a technology to rework a production system of decentralised cloth manufacture that had gone out of use. It meant replacing the inefficient processing techniques and wasteful transportation of cotton by techniques that could be done at the farm and cottage levels, and finally to varieties of cotton that would suit decentralised manufacture. Just as Indian varieties of cotton were unsuited to modern textile mills and caused injury of staple, American varieties of cotton were unsuited to the indigenous cottage mode of manufacture. The seeds of these varieties were too soft and would get crushed in the hand gins. It was thus not possible to conceive of an Indian swadeshi khadi movement with American cotton.

The khadi movement that started with the aim of reintroducing spinning to the masses had to look at the varieties of cotton suited for home-based production. The movement had its own laboratory, the Satyagraha Ashram, where tests on all aspects of cloth manufacture were conducted. Heading the technical department of the All India Khadi Board (later the All India Spinners Association) was Maganlal Gandhi who played a big role in providing the necessary technical inputs to the demand for khadi cloth created by the non-cooperation movement and the swadeshi vows. Maganlal and his co-workers had to set new parameters of quality cloth production that was to be experimented and validated at hundreds of production centres through out the country. They had to research, innovate, test and try out different types of tools for use in the movement. Experiments on growing of cotton varieties were carried out at the Ashram simultaneously with improved gins, carding bows, charkhas and methods of testing yarn.

The popular political journal *Young India* reported the results of the experiments on the cultivation of cotton through Maganlal's column, 'Khadi Notes'. Maganlal was not biased in favour of indigenous cotton varieties. He was attempting to grow high quality cotton for use in decentralised manufacture. Initially, the focus was more on care in the growing of cotton and proper manuring even through composting human excreta. His experiments and experiences soon led him to recommend growing hardy and resistant cotton varieties and also tree cotton in the backyards of peasants' homes. Maganlal followed up his insights on perennial cotton with the varieties of tree cotton that could be grown.[40] The Ashram began co-ordinating the supply of good quality seeds separated by the hand gin. The column soon became a forum to report the diverse varieties of cotton from places as far as Bengal and Karnataka. Science and khadi were very much part of the political agenda of the Congress and Congress workers were urged to bring all varieties of cotton grown in their region with particulars of soil, climate, rainfall, etc, for the annual khadi exhibitions during the Congress Plenaries.[41]

In his book *Charkha Sastra* (translated in English from Gujarati in 1924) Maganlal Gandhi mentions in detail the ways of examining good cotton and compares Indian cotton and hand processing with machine processes. Maganlal realised the important connection between hand spinning and growing of cotton and remarked that the extinction of the fine art of spinning "spelt the death of fine cotton growing in India". In acknowledging that the fineness of American cotton of 20th century was through "gradual improvement brought about by careful and scien-

tific cultivation" he was implicitly setting the research agenda for proper cultivation of cotton for India to recover her glory of the past. In the section 'Examination of Cotton' we find an elaboration of a different science that on the one hand acknowledges the effort of the scientific advances of the west, but on the other, argues for a different application of this science in another cultural and geographic context.[42]

Maganlal goes about his scientific experiments by first validating, through experience of use in the field, the Indian hand processing techniques. He affirms faith in the tools by arguing that the proper use of these could lead to good yarn.

> The yarn spun out of these slivers (of small carding bows) is so clean and strong that it surpasses superior qualities of even mill yarn. Cotton receives such a rough handling during the process of cleansing adopted in the mills, that it is found by scientific calculation to be losing 80 per cent of its vitality. If strong staple cotton is drawn out of the pods on the plants without allowing any dry leaves to intermix with it and is carefully ginned with a hand ginning machine and similarly carded, it would also yield very good yarn.

Maganlal then makes an important shift in the way this science could be validated by insisting that it is right at the farmer's fields, and not the laboratory, where the cotton is best examined. He says,

> It is not so easy to determine the quality of the cotton when it is ginned as when it is still adhering to the seed...The habit of observation is a most valuable acquirement of man as necessary for matters worldly as well as spiritual, and the examination of cotton contributes to its development in no small measure.

What is of interest here is the possibility of a science where universality is not in its repeatability in specific conditions but in the sense that every man could be a scientist without the need for expensive laboratories. A farmer examining cotton with care in his field was practising science on similar terms as a laboratory scientist or technologist.

'Examination of Cotton' reads like any laboratory manual.

> Take a small quantity of cotton. Grasp half of it in each hand and then divide it into two parts by pulling away the hands. If the sound (of separation) is dry and gritty, it means the cotton is strong and good. If low, it is the contrary. Sound varies directly according to quality.

Maganlal was quick to remark however that this seemingly simple test required practice that would make it an art.

> To be able to detect the differences in this sound requires almost the same capacity as is required for distinguishing the finest variations in a musical note.

He writes similarly on strength tests.

> To test strength one end is held by the fingers and then stretched. Their strength is seen by the resistance offered to strain. A long practice is necessary to learn to recognise their relative strength by this process. An aspirant for proficiency in spinning ought to be able to recognise the quality of cotton.

Maganlal in an innovative shift connects these processes with education and the political context of the times by suggesting that village schools be the 'model farms'.

> In villages a small cotton farm can be attached to each national school to facilitate the learning of this art. If the teacher has a taste for gardening, by his experiments he can improve the cotton cultivation of his village. What is done at enormous cost at the government farms can be done at a much smaller expense by our national schools. By paying taxes cotton cultivators and merchants are indirectly bearing the burden of the enormous expense of such farms. They could be paying a direct tax to the national schools of their own villages contribute to improve the art of spinning and be able in the near future to enjoy the sweet fruits of national welfare.[43]

At the more practical level he recommended steps for better quality of cotton and yarn that included field picking of cotton instead of pod picking, drying before ginning to prevent crushing of seeds and formation of weak fibres, and thrashing with a hooked stick to reduce ginning time. Drying he said was essential as improper drying can lead to seeds getting crushed. For best results he suggested that spinners take cotton direct from the fields, failing which they use hand ginned cotton and in the worst case machine ginned but unabled cotton. Baling according to him would make the thrashing insufficient and necessitate additional scrubbing making him to remark that "machine made slivers even if made from good cotton is inferior to hand made slivers as the vitality of cotton fibres is destroyed by 80 per cent in passing through various machines".[44]

Maganlal perhaps did more than any of the government scientists in the programme in improving Indian cotton varieties and reversing the trend in favour of American varieties for global trade. The Ashram had set the parameters for research in the movement by encouraging people to grow their own cotton even if it was just in their backyards. The Ashram also set the standards, by example, of the quality of yarns for hand spinning, and thereby, the methods of processing and care in cultivation of cotton. The khadi movement tried establishing its own norms of quality which while on the one hand was open to the question of diversity, on the other, allowed for the possibility of constant improvement through continued experimentation. Quality was not forsaken for greater production. In his notes Maganlal advised workers that the manufacture of strong and good khadi was more essential than increase in the quantity of production. He warned spinners against spinning yarn of high count but weak yarn. He would rather have the spinners spin lower count yarn superior to the mills. In Maganlal one finds a hard headed scientist for whom the fact that India possessed traditional knowledge of high calibre was not reason for elation, but rather, the fact of its extinction a case for serious research "to go deeper into these things and not assume it to be easy and simple". He urged Congress workers to involve themselves deeply into the art of cloth manufacture and take interest in all the processes, not just spinning.[45] Enthused by the atmosphere created by Maganlal and Gandhi, there were workers like Laxmidas Purushottam who took on experiments in the Ashram to "demonstrate that given good cotton and good carding, it was possible to draw fine thread that would beat the strongest mill yarn of the same count".[46] The continued production of khadi cloth started providing new insights and facts on indigenous processing techniques making Gandhi remark that, "machine ginned and machine pressed cotton loses its vitality and is more difficult to treat with the hand bow than hand ginned cotton".[47]

The Ashram was not averse to using modern textile testing apparatus if it suited their purpose.[48] What is of particular interest here is the process of scientific research that leads to different results based on fundamentally different axioms, in this case local production for use instead of production for export. Maganlal was no Luddite fighting American varieties of cotton. We find in his model of research a lot of importance given to field experiences. In his notes he does no more than report these experiences and the connections between cotton variety and the kinds of processing. The khadi movement thus shows a different relation between the centre of research and the place of application – the laboratory and the field. Research at the centre did not make for a universal validity of truth claims to be applied at the field, but on the contrary, the field worker had to do his own research and validate it locally. Conversely, the

'laboratory' (Satyagraha Ashram) was also to be involved in production making it sensitive to every crisis in the field. This is in contrast to the model of agricultural science prevalent today where despite large numbers of suicide deaths of farmers, the scientific establishment seeks to explain the crisis merely as failures of extension mechanisms or ignorance of the farmers. It does not see it as a crisis in agricultural science.

It is quite probable that the experiences and experiments of Maganlal could have, if continued and collated, provided fresh insights and newer theories on textile manufacture. However, the demands of the movement and his untimely death in 1928 ended a significant chapter in the technical history of the movement. Krishnadas Gandhi, the secretary of the All India Spinners Association (AISA), was later to remark in 1949 that no systematic efforts to research on cotton growing were taken up after Maganlal's death. Maganlal had by then established the qualities of home-based processing. The AISA planned a khadi museum in his memory, which would house specimens of the finest yarn, the various implements of manufacture of khadi from different parts of the country and a plot where experiments on cotton growing would continue. The AISA basing itself on his experiments and experiences in the field could by then confidently proclaim the superiority of decentralised manufacture and had established that "home-grown cotton which is well picked and which does not need to undergo the devitalising process of pressing enables the spinner to draw a stronger thread".[49] However it was not until Richard Gregg brought out his scholarly book on khadi in 1928 titled, *Economics of Khaddar* that these insights from the field were placed in the larger context of the debate between hand-based and machine-based manufactures.

Gregg and Khadi Science

Gregg, an American lawyer with experience in industrial labour problems, spent two years in the villages studying the movement and put together the insights mentioned above by connecting them with some scientific results from the modern textile processes. He embarked on a systematic analysis of cotton technology to place in perspective the possibility of fine and durable cloth through hand production.

Gregg argued that as no two fibres of cotton were wholly alike modern spinning practices required more elaborate processing of the fibre prior to spinning. Hand operation of yarn, on the other hand, allowed for the "sensitive touch and sight and discriminating judgment and skill of the worker to instantly change and adapt itself and the working of implements to the variations in the fibre." Gregg throws more light on the loss of vitality that Gandhi referred to by pointing to the inherently violent and inefficient methods in mill spinning. "Cotton for mill spinning needs to be cleaned, mixed, beaten, and drawn many, many times. The necessity for greater output from the machines results in all these processes being done at high beater and roller speeds in power ginning, enormous pressures in baling cotton and further violent, high speed beating in the opening or blowing process, high speed machine scutching and carding. All these bruise, scrape, strain, cut and injure much of the fibre, and waste much of it, and decrease the elasticity, strength and 'vitality' of what survives. The corresponding hand processes", Gregg observed, "were vastly more slow and gentle, and tended far more to preserve the qualities of the fibre."

Gregg pointed out that durability was not just through uniformity of fibre, but also of strength, pliability and elasticity. What Gregg alludes to is the fact that what the Indian mode of production lacked in at a particular stage or attribute in comparison to mill processes, was compensated for in a later stage or by other attributes. Comparisons at each stage on parameters set up by modern spinning processes would disfavour Indian cotton and processing techniques. However, if a comparison was made of the cloth as a whole then Indian hand spun cloth was more durable. Thus a relatively weaker yarn that would make weaving impossible in mill weaving would be possible by the handloom. What individual fibres in Indian cotton lacked in strength was compensated through greater twist provided in spinning. Greater friction between fibres in hand spinning resulted in little loss in overall strength of the yarn.

Gregg pointed out other advantages of charkha yarn over mill yarn. The individual fibres were stronger and more elastic, the twist more uniform, no electricity developed in the hand process and the individual fibres were better locked. The larger periods of storage for ripening and drying in hand processes gave more twist to the individual fibres and greater strength. The exposure of raw cotton to the sun increased the elasticity of the seeds and helped prevent their being crushed in the gin. Gregg gives us further proof to show how the demands of trade worked against the qualities of the Indian fibre and how increased speed of operation was at the cost of quality. The hurry to send the cotton to the ports from the inland production centres before the onset of monsoon prevented Indian cotton in the 19th century from attaining its maturity and true strength. If Maganlal had set the stage for research on hand made processes, Gregg provided the theory and scientific understanding for the Charkha Sangh's claims on quality.[50]

Naik and the Kapas Samiti of Charkha Sangh

The khadi movement was unable to work out all these possibilities though it had faith in them. The need for systematic work on cotton varieties was taken up only in the late 1940s with the setting up of a 'kapas samiti' ('cotton committee') under the auspices of AISA in 1949. Dadabhai Naik, who was the head of this committee was perhaps the last dissenter to argue for the quality aspects of Indian cotton. Much of Maganlal's experiences were based on Gujarat, which had traditional long staple cotton. Naik's experiences in Madhya Pradesh made him to question more frontally the mistaken notion of longer staple leading to more durable cloth. He argued that government policy favoured the mills through legislation and pricing policies disfavouring short staple varieties. The government scientists claimed that tree cottons attracted pests and legislated against it asking farmers to burn the plants after harvest. The pest problems however did not reduce but some indigenous tree cottons like the Karunganni never survived.

Given the total neglect of research by research laboratories regarding varieties suited to khadi, the AISA decided to embark on an ambitious research programme on cotton. This programme recognised that diversity of varieties was possible and could only be preserved through larger participation of people in the scientific quest. The research agenda of the AISA was to progress through open sharing of information and a call was made for participation by farmers and enthusiasts to build a knowledge base of the varieties of Indian cotton through large-scale experimentation across the country at various farms and regions. The committee listed the parameters for research, which emphasised pure line selection of local varieties of local cotton over the hybrids, and durability and maturity of fibres over staple length. Primary research was to be done at the farmers' fields and there was scope for final testing at the government laboratories, though with an altered perspective. Naik insisted that the laboratories would have to look at the cloth as a whole and not just the fibre or yarn strength. Naik went further and suggested a 'wear test' (emphasising

durability) instead of the conventional 'tear test' which was based on tensile strength.[51]

Krishnadas Gandhi, the then secretary of AISA, made an attempt to share these insights with the Indian Central Cotton Committee (ICCC) to get them involved in research into indigenous cotton varieties. He placed before it the field experiences of the movement, namely, that durable cloth of the last 20-25 years were not from the prevalent cotton varieties. He pointed to the difficulties spinners faced in obtaining pure strains of rozia that gave durable cloth due to programmes that favoured the higher yielding jarila in the cotton tracts of Madhya Pradesh. Gandhi requested ICCC for varieties suited to each region. Placing their own experiences regarding desi cotton varieties, he questioned the ICCC on parameters such as tensile strength and staple length wondering if they were the only factors in the making of durable cloth.[52] This open invitation by the khadi movement to ICCC does not seem to have met with any meaningful response or rethinking by the scientific establishment. The findings of the khadi movement were relegated to ICCC's section on perennial cottons without creating any change in its main agenda. Naik was invited for a seminar on perennial cotton three years later and the cotton establishment continued its research agenda oblivious to the scientific questions raised.

At the seminar Naik was critical of the policy for finer cloth that necessitated import of cotton or cloth. He stated that the durability of the cloth made out of long staple cotton was suspect. "It is a half truth that the long staple cotton gives us a more durable yarn. The cleanness and strength of cloth is not dependent on the length of the staple as much as the percentage of maturity of the pods. Varieties with long staple have a lesser percentage of mature pods. ... India has always known to produce medium and short staple cotton. It is from these that the fine and strong muslin cloths was made and are being made. The Mochri and Gajjar kokti of Bihar, Kondapatti of Andhra and Bani of Madhya Pradesh are examples of these. So too the Coconadas and Nadams."[53]

The slow degeneration of the khadi movement after independence through its bureaucratisation made Dadabhai Naik the last known dissenter arguingfor indigenous varieties Naik put together his decade of research in a book titled *Kapas* in which he forcefully argues the case for indigenous varieties.[54] It is only in recent years that some scientists in the cotton establishment have started questioning policies that have disfavoured indigenous varieties.[55]

We have in this study attempted to link the khadi movement with the dissenting views in the history of textile technology. This helps us draw a different direction in the history of technology by charting out a genealogy of dissent, focusing on the roads not taken, and thereby understand to the biases that favoured a particular choice of technology. It is only by appreciating these fundamental changes in textile history that the present crisis in cotton farming can be set right. The clamour for greater yields of cotton without looking at the issues of sustainability and quality is likely to create more situations for suicides and starvation deaths. This presents a great challenge to researchers not only amongst cotton scientists but also in the textile industry and the khadi establishment.

The suicide deaths of farmers is a failure of agricultural science that the scientists can come out of only if they appreciate the historical nature of this crisis. Rather than look for collaborations with scientists' abroad in transgenic cotton and in growing organic cotton, the scientists would do well to listen to the long list of scientists and dissenters who spoke on and worked towards improving Indian cotton. The faith in Indian cotton varieties needs to be much more than peripheral attempts along the Indo-Pak border to ward off pests. Much more needs to be done within India to deal with the over use of pesticides and to reestablish the quality of Indian cotton of ancient times. It is only by being self critical of its role in society and being open to learn from traditions outside its own that the scientific establishment can be free from the danger of repeating the follies of history.

Notes

[I would like to acknowledge the insights of Uzramma, the research work of Ramakrishna, and assistance of Ambirajan in this study. I thank Amrit Srinivasan for comments on an earlier draft and the Textiles Working Group which has been instrumental in keeping the debate alive even prior to the recent suicide deaths.]

1 Farmers in Haryana and Punjab have started shifting to other crops and to traditional varieties of cotton forsaking higher yields for greater pest resistance. Area under cotton this season was down 25 per cent and area under American varieties reduced to a half. See 'Cotton crop badly affected in Haryana', *The Hindu*, May 29, 1998.

Philosophical Foundations of a General Theory of Numbers

Chhatrapati Singh

This paper considers how Indian mathematicians have traditionally cognised numbers and their operations, and what bearing it has on problems faced by modern number theories. The discussion is not merely an exposition of the traditional Indian view. The Indian conceptions have the potentiality of generating alternative perspectives which may be conducive to providing solutions to modern problems or in striking our new paths. It is these alternatives that this paper seeks to explore. It considers not just algorithm of numbers but their philosophical foundations. Since algorithms and axioms are finally based on philosophical ground beliefs, it is only by analysis of these beliefs that clarity can be achieved for alternative conceptions.

Before discussing the Indian views and their consequences, it first states the general problems about numbers posed by the western tradition for which solutions have been sought and discusses the attempted solutions to the important problems. It is only in the light of this that the Indian alternative can be properly appreciated.

I
General Problems

THE numbers involved in enumerating – 1,2,3, etc, are taken to be of the simplest kind. Since late classical Greek times these have been called 'natural' numbers, thereby being contrasted with the 'artificial' kinds of numbers, such as rational numbers (all numbers expressible as fractions), real numbers (all numbers that measure length and areas – for example, the ratio of hypotenuse to side on an isosceles right triangle, $\sqrt{2}$, although real is not rational), complex numbers (those having 'imaginary' components based on $\sqrt{-1}$) and transfinite numbers (uncountably large numbers). Theory, dealing with natural numbers alone is elementary number theory; whereas theory of real numbers is known as analysis. I shall be using the term number theory generally, to include all types of numbers, unless otherwise specified.

There are two distinct types of foundational issues involved in any number theory: (a) what ground beliefs (as axioms, theorems, principles, etc) must one accept for the relationships that hold between different types of numbers; and (b) what basic beliefs must one accept for the relationships that hold between these different types of numbers and reality. The first concerns issues about internal relationship between numbers and the second that of external relationships between numbers and the world. The first belongs to mathematical logic, and the second to philosophy of mathematics. These two issues require different types of solutions, but number theorists often mix and sometimes confuse them. This happens because, as we shall see, one's views of internal relations, i e, in mathematical logic, is not independent of one's view of external relationships, i e, in philosophy of mathematics.

The general problem about internal relations concerns the derivation of all types of numbers from a single prototype, always the natural type. The desire for such a derivation is grounded in the fact that if successful, a deductive internal relationship would have been shown to exist amongst different types of numbers. The establishment of deductivity has its psychological roots in the desire to remove arbitrariness and discontinuity in the existence of numbers, and its epistemological roots in the desire to show what is possible as following from what is known to be real. A similar further feat is then desirable on the class of numbers that has been taken to be the prototype, the natural numbers. These have to be shown to be derivable from a set of basic axioms. The motivation once again is same – if all theorems can be derived from the axioms, an internal relation of deductivity has been established within that class of numbers. The basic epistemological requirement can be expressed in Leibnizian terms: there must be necessary and sufficient reason for the existence of anything.

There are some outstanding problems concerning internal relations for which no solutions have been found so far. One concerns finding the algorithm from which the occurrence of the prime numbers in the natural numbers series can be deductively deduced. Another concerns showing deductively why every even number is the sum of two prime numbers – the Goldbach conjecture. And yet another, Fermat's last theorem about why there is no natural number satisfying the equation $x^n + y^n = z^n$, where n is a natural number greater than 2.

Solutions to the problems about external relations, however, are much more baffling. The first general problem is: what do numbers represent in relation to the external world or human consciousness? The usual answers, such as that they represent classes or sets, are intelligible with reference to natural numbers, that they run into serious difficulties with real (incommensurate) and imaginary or transfinite numbers are considered.

The second general problem concerns explaining the reasons for the occurrence of similar or same periodicity in the number series and series of disparate entities in the world. For example, the series of tones in the musical scale has almost the same periodicity as that of prime numbers. Similarly, the harmonic series in progression of numbers is named after the series of musical notes which are harmonious in progression. One may also note that the progression of numbers of protons in the nucleus repeats its properties after every seven protons. Exactly similar is the case in music, after the progression of every seven whole tones the eighth tone repeats the properties of the first. Then there are 'invariable constants' in physics, whose values turn out to be the same in all operations and frame of reference, such as Dirac's number, or the speed of light or Avagadro's number. One may dismiss such observations as contingent coincidences, but they may not be so. There may be a deeper reason why the periodicity in matter and music are similar, or why some values are invariable. Insofar as the human mind seeks sufficient reason for every phenomenon, the basic problem about explaining the relationship between numbers and the reality with which they coincide remains. Let us turn now to review the important solutions that have been

provided for these problems. I shall discuss solutions to problems concerning internal and external relations separately.

II
Modern Solutions

(a) Internal Relations

Philosophical puzzlements about various kinds of numbers was greatly reduced by the works of Richard Dedekind (1888) and other 19th century mathematicians who developed a unified theory of numbers. They showed how each of the artificial kind of numbers, together with the operations (such as addition and multiplication) performable on numbers of that kind, can be defined in terms of the natural numbers and the operations performable on them. Moreover, they showed that this can be done in such a way that the laws that govern the artificial numbers can be deduced from the laws of natural numbers. In short, they were able to construct artificial numbers from natural numbers or reduce the former to the latter. This established an internal relationship of deductivity between numbers. There are alternative schemes of definitions that make this possible; one approach is as follows: Rational numbers can be defined as a certain type of sets of ordered pairs of natural numbers, the real numbers as a certain kind of set of rational numbers, the signed (positive and negative) real numbers as a certain kind of sets of real numbers, and the complex numbers as ordered pairs of signed real numbers. By using George Cantor's theory of infinite sets this scheme can be extended to yield a hierarchy of larger and larger infinite numbers. The resulting unified theory enables us to regard the various kinds of numbers as belonging to a single family, all emerging from one parent kind and governed by the same principles. The problem then remains of showing the generative principles of natural numbers only. The accepted set of axioms for generation of natural numbers are those presented by Peano (1889). His postulates run as follows:

(P1) 0 is a natural number.

(P2) If x is a natural number, there is another natural number denoted by x' (and called a successor of x).

(P3) $0 \neq x' = y'$, then $x' = y'$.

(P4) If $x' = y'$, then $x = y$.

(P5) (principle of induction):

If Q is a property which may or may not hold of natural numbers, and if (a) 0 has the property Q, and (b) whenever a natural number x has the property Q, then x' has the property Q.

There are numerous more refined symbolic representations of these basic axioms which attempt to delimit the meaning of the primitives 'successor' and 'property'. In their *Principia*, Russell and Whitehead (1910-1913) attempted to deduce the above axioms from basic principles of logic so that axioms and theorems of arithmetic may be shown to be totally derivable from basic logical principles. Such a reduction is called a logistic thesis for arithmetic.

Assuming that the Dedekind-Peano scheme and Frege-Russell logistic interpretation of it is correct in some ways, does it really amount to a general theory of numbers as Dedekind claimed? This is far from the truth, despite ubiquitous beliefs to the contrary. First, this approach ignores the problems about the external relations of numbers to the world, in the wider sense explained earlier. That is, besides being unable to give a satisfactory answer about what numbers represent, the theory fails to explain the reasons for periodicity or the lack of it as amongst prime numbers. Second, the very basis on which internal relations are attempted to be explained are themselves questionable. It invokes the notion of the 'pair', or 'order' and of 'set'. Within this theory these notions lie on the boundary which joins issues of external relations to those of internal relations. The notion of a 'pair' is itself a notion of a number, because its comprehension involves understanding what is meant by two; that is, one cannot claim to have cognised a 'pair' and not understood what is meant by two. This assumption is therefore question begging. Employing the notion of sets, and attempting to reduce number theory to set theory has its own problems. For first, by now mathematicians have shown that various schemes of definitions are available for characterising set-theoretic entities having the desired structural properties. We have no reason for regarding one of these as the correct or preferred scheme of definitions for numbers and other schemes as false. Second, in response to paradoxes within set theory – such as Russell's paradox,[1] several distinctly different forms of set theory have been evolved, each having some advantage and some disadvantage, but none being free of arbitrary limitations. This undermines the view that with the help of set-theory we can discover and describe the structure of a realm of abstract reality. Further, it is now known that natural numbers cannot have decision procedure consisting of mechanical routine steps as a general test of the truth of statements expressible in the notation of the number theory. This fact is corollary to Kurt Godel's (1931) proof that there can be no consistent set of axioms for natural numbers from which every truth expressible in the notation of the theory could be deduced. Another fundamental discovery is the Lowenheim-Skilem theorem which states that if a set of quantificational schemata are consistent they all come out true together under some interpretation in the universe of natural numbers [Thoralf 1934]. This implies that the logical structure of any theory (its truth functions and quantifications) is insufficient to distinguish the objects of the theory from natural numbers; they could as well have been words or musical notes. Logistic schematisation, including axiomatisation, by itself is, therefore, insufficient to prove that the rules reveal the deep nature of numbers and not of other entities. This realisation, as we shall subsequently see, has significant relations to the Indian perceptions.

(b) Critique of Sufficiency of Internal Relations

Despite the differences between the numerous set-theoretic and logistic approaches to problems concerning internal relations of types of numbers and those inherent in natural numbers itself, there are some common threads running through all these diverse attempts. It is important to note these because they are some of the basic tenets which distinguish these lines of western thoughts about numbers from the Indian view. These tenets are:

(a) The belief that the progression 1,2,3, etc, of integers is in fact the natural kind, i e, these are the most elementary types of numbers which must form the basis for all other types of numbers; it must be noted that within the schema this is dogma, however, intuitively certain one may feel about it. There is nothing in mathematics to warrant the belief that what we call 'complex' or 'artificial' numbers are not indeed the natural kind, in the sense that they most truly reflect, or are related to, the way the world is naturally ordered. That the world is not naturally ordered in the progression 1,2,2,...The particulars are just there.

(b) The belief that progression of numbers is ordered n natural succession of unity, so that the successor of n must be n+1. This basic assumption of Dedekind-Peano, Russell and others, is a dogma too. It may be true by definition but not necessarily a feature of how progression happens in reality. It is quite possible that real progressions are incommensurate, and therefore the progression of a value, which may be designated as a number, is an incommensurate value, the next number.

The assumption that 'natural' progressions are in unities is a mental construct. Standing as much in need of justification are hypothetical: axioms of number theory always assert the existence of something. The axioms invariably run: 'There is an x such that x has the property...'. Once the axioms are expressed in this way the question naturally arises: what is the nature of the thing whose existence is being asserted? Or perhaps, is it the case that one has first presumed that numbers must exist as something and in some way, and then gone on to construct the axioms? This is not unlikely. But first let us see what sorts of solutions have been proposed to unravel the nature of the existence of numbers.

One broad category or philosophical views comprise those according to which the laws of number theory are somehow literally true. They attempt to assert that things deserving the name of numbers do exist and are in no sense fictional, and that such things are amongst whatever belongs to the "ultimate furniture of the world". Literalistic views can be divided broadly into three kinds: nominalistic, conceptualistic and platonistic. I shall consider only these three views in some detail here because it is these that have gone into the various formulations of axioms in the number theory, such as of Peano and Russell.

Nominalism is the view that there are no abstract entities. A crude version of formalistic nominalism would identify numbers with signs on paper, blackboard or wherever they occur. More serious formalism would assert that only such signs exist and that there is nothing else of numbers besides them. A psychologistic nominalism, on the other hand, would identify numbers with particular ideas occurring in people's heads. Gottlieb Frege (1962) criticised such nominalistic positions by pointing out that there are larger numbers which have never been written down or thought about. These would not exist in this view. Also, different languages have different signs and words for numbers. If their existence were identified with these signs or words each number would have a simultaneous multiple existence and its uniqueness of meaning would be lost. W V Quine and Nelson Goodman (1947) have attempted to provide a more sophisticated version of nominalism. However, no series of actual concrete items in the real world seems capable of being known to constitute a progression in the full sense required by such number theories. Moreover, this view also overlooks real and transcendental numbers which can neither be completely written down nor thought of. For this reason nominalism fails to provide an explanation for the existence of numbers.

Conceptualism may be roughly characterised as the view that abstract entities exist but only in so far as they are creatures of human thought. As a literalistic view of numbers conceptualism may be regarded as holding that numbers literally exist as timeless abstract things yet are mental constructions which have no being independent of the mind. Kant (1764; 1781) is a representative of this view. He connected numbers with time (a 'pure intuition', 'the form of inner sense') and believed that knowledge of numbers rests on the mind's capacity to repeat the act of counting, time after time.[2] In recent time L E J Brouwer (1912) has also defended a similar view. This form of intuitionism faces problems similar to nominalism. First, there are larger numbers which have never been counted, therefore their status becomes problematic. Second, there are real numbers which cannot be counted hence their status too becomes dubious. However, the more serious problem with intuitionistic conceptualism is its difficulty in explaining how mental constructs apply to external phenomena, including those where periodicity and progression are involved. For example, does the mind construct the nation of the progressions between musical notes or does it discover them as property of sound? It is more commonsensical to hold the latter view. When such conceptualism is pushed to its logical consequences it must lead to idealism, such as of the Hegelian kind, where the real becomes the rational and the external-internal distinction does not hold. The problems about numbers would, however, still not be solved, although the problem of its application would. For example, it would be a great puzzle how the mind can claim the existence of all numbers when it has not constructed them, or how it can deny it when there is nothing else besides mind. Problems about numbers which cannot be counted will also remain.

Platonism is a realistic view which holds that numbers neither exist as signs nor as mental constructs but have an independent existence in a separate realm. It is the mind's task to discover the properties of this realm. Recent set-theoretic and logistic theories of numbers, such as of Dedekind, Frege and Russell, have tended to be platonic. Such a strategy is more an attempt at explaining away the problem about numbers than at explaining them. For, in effect, what it does is to shift the problem about the status of numbers to problems about a whole realm of mathematical entities which include numbers. One has then to inquire about the ontological status of this whole realm and its relationship to the actual world. Explaining the reasons for plurality of realms has its own metaphysical problems, but in this case the difficulties are additional. Because what is supposed to exist in such a realm are universals, not particulars, or 'forms' in Plato's terms. Now whereas with respect to figures and shapes the notion of an ideal or universal form of geometrical entities is intelligible – in the sense that in imagination one may attempt to visualise the form of a perfect circle and blame the imperfection of one's cognition on the limited capacity of the mind, this type of intelligibility is not available when one attempts to visualise or cognise the form of a universal or perfect two. Any two seems to be just as any other two, unlike triangles or circles which have degrees of perfection. Extending platonic realism beyond geometry creates more confusion than clarity, besides compelling one to give spatial interpretations to numbers in which their 'forms' are sought.

None of the main literalistic theories of numbers is satisfactory. The fact that Peano, Frege, Russell and others have tended towards Platonism, and that the basic assumptions mentioned earlier have been employed, makes it necessary to inquire into the Greek foundations from which they derive their life.

III
Greek Foundations

In Greece mathematics developed out of the necessity to measure land. This necessity arose from the manner in which real estate was divided amongst individuals. Regulation of property through law, which found better expression in the Roman law, was thus directly related with the development of geometry, which by and by became the paradigm science.

In India family and clan structures did not necessitate division of land holdings. Property was held in common by the family or the whole clan or tribe. Communal rights in land involved the notion of 'kshetra' or field within which individuals could enact (live) their lives. Thus, the science of possible actions within a field drew greater attention than geometry. Considerations of possible actions made predictability the central goal of science, and not measurement of exactitudes as it happened in Greece. The fact that only an area which is exact, distinct and measurable can exist as someone's property in law or custom, brought about a deep rooted

association between the notion of existence and exactitude, distinctness and commensurability, in the Greek mind. Individualism at the economic and legal levels is thus not unrelated to the epistemological and ontological assumptions which the Greeks applied to mathematics.

For Greek mathematicians, thus, whatever was exact and distinct existed and vice versa. Euclid's assumptions, therefore, are all existential postulates, they all assert the existence of something, and of relations between them. The belief that whatever exists is clear and distinct subsequently become a basic tenet of western mathematics, its clearest exposition being the Cartesian one. This also made the notion of the copula 'is' or 'to be', the central notion around which identity relations could be asserted as basic mathematical propositions. In short Cartesianism and Platonism have formed the foundational background for mathematics in the west.

With the rise of different types of geometries in this century the Euclidean postulates of existence and hence Platonism, had to be dropped for this part of mathematics. But not so for number theory. Peano's, Dedekind's, Russell's and other scheme, as we have seen, begin with existential postulates. They also attempt to reduce incommensurate complex or real numbers to exact and distinct natural numbers whose existence is certain. This is true of both set-theoretic and logistic interpretation of numbers.

Cantor (1932) characterised a set as "any collection of M definite well-distinguished objects of our intuition or thought which are called the 'elements' of M, into a whole". Notice the Cartesianism in this definition. It has formed the basis of most subsequent set-theoretic explanations. It is virtually impossible to explain Cantor's idea of a set without using words of the same general type, only vaguer, such as 'collection', 'multitude', etc. The notion of a set is an existential primitive in this scheme.

The move from set-theoretic explanations to logicism is through Frege (1962 Vol I: 36ff). Instead of 'set' Frege used the term 'extension of a concept'. The extension of a concept is simply an object associated with the concept in such a way that if two concepts apply to the same object they have the same extension. Frege's usage is based on the tendency to regard the predicates of a language as standing in quantifiable places and to derive from the general terms abstract singular terms, which are usually explained as referring to properties of attributes. Since identity relations, in which general quantifiers quantify variables, can be expressed symbolically as logical formulae, Frege's scheme makes way for the reductions of arithmetic to logic, Frege's ideas were, in effect, to define the cardinal numbers as the equivalence classes or relation in which there was one-to-one correspondence between the numbers and the extension of the concept. This definition requires a powerful use of the notion of extension, which in the final analysis are sets, since Frege regarded numbers as not features of individual things but pertaining to sets. We have already seen the problems with set-theoretic explanations.

The alternative to Frege's scheme, the Hilbert programme, also rests on Platonism. Hilbert (1928) sought to establish classical platonistic mathematics on a firm foundation by formalising it and providing the result of this formulation as internally consistent for all theorems of arithmetic. Godel's proof showed Hilbert's programme to be impossible. In recent times mathematicians have attempted to analyse numbers on the basis of recursive function theory and model theory. Their theory uses constructivist methods, but their philosophical foundations are unclear. We shall consider them in some detail after discussing the Indian perception of numbers. The Indian perceptions too, as we shall see, leads towards constructivism, but for altogether different reasons.

IV
Indian Approach

The orientation of Indian mathematics was towards finding basic algorithms on the basis of which predictions could be made. A basic reason for this was that astronomy in India had close affinities with religion. All Vedic rituals were, and still are, performed strictly in accordance with the position of the stars and the members of the solar system. The necessity to predict their exact position thus became a matter of utmost importance.

Such a social requirement necessitated the development of algebra, and not merely arithmetic and geometry. The evolution of algorithmic rules through application of which the values of unknown variables could be determined was a natural consequence of the desire to extrapolate from the known to the unknown. The notion of a field, kshetra, in which the individual variables could play their specific roles was already available to the Indians on account of their social and legal arrangements. Algebra was therefore conceived as 'bija-ganita', as a science of planting individual unknown bija (seeds) in kshetra and then finding out how this bija varied or grew within this field. Such an orientation is evident in the earliest *Sulbasutras* (texts on menustral geometry) and *Vedanga Jyotisa* (astrological work). The notions of kshetra, karma (action) and phala (results) which go together had their basic metaphysical roots in 'samkhya' philosophy, as one can find in the *Samkhyakarika* as well as in the Gita which was influenced by it.

Such an orientation has some important consequences. On the one side it avoids the dogmas of Platonism and Cartesianism, and on the other, it offers a different perspective on intuitionism. I shall discuss the two aspects separately.

Whereas the Platonism of Greek mathematics has accepted numbers as entities and its geometrical Cartesianism made the Pythagoreans seek geometrical shapes as property of numbers – such as square numbers, pentagonal numbers and triangular numbers, the Indians were not stifled by accepting numbers, as entities. *Anuyogadvara Sutra* (100 BC) classifies numbers into three types: (1) 'samkhyata' (those cardinal numbers which can be ordered by ordinal numbers), (2) 'asamkhyata' (those which cannot be so ordered, e g, incommensurate numbers), and (3) 'ananta' (those which cannot be ordered, at all, e g, infinities.) This general division, with further sub-classifications, is pervasive in later works. *Apstamba sulbasutra* (3.8) classifies numbers as 'nitya' (commensurate) and 'anity' (incommensurate). Algorithms to determine the value of 'anitya karanis' (surds) were developed in great detail. More refined methods are to be found in *Aryabhatiya*. In Bhaskara-II's commentary on *Aryabhatiya* specially in the chapter 'Goladhyaya', as well as in 'Suryasiddhanta' and in *Katyayana sulbasutra*, rules to determine the values of incommensurate numbers find clear specifications. Similarly, fractions and negative numbers did not pose any puzzlement for Indian mathematicians. *Apstamba sulbasutra* classifies all fractional numbers as 'bhaga' and develops rules for operations on them. The important fact to note is that Indian mathematicians did not perceive the field of numbers as disconnected or asymmetric, unlike the Greeks who found it heterogeneous. The reason behind perception of numbers belonging to a homogenous field is that they cognised numbers not as entities, but purely as phala (result) of mathematical operations in the field of samkhya. In ancient Indian texts samkhya did not denote number (as

it does in Hindi now). It was a generic term denoting any quantifiable or determinable substratus (kshetra) from within which, amongst other things, numbers could be generated. The meaning of 'samkhya' in the name of the text *Samkhyakarika* makes this evident. This book is not about numbers, but about determinable and discernible results in the development of the indeterminate substratum ('padartha'). In his chapter of 'Bija-Ganita' in *Aryabhatiya* (1.1) Bhaskara-II states:

Utpadakam Yatpravadanti Budherdhistam satpurusena samkhya. Kritsanasya lokaeya tadek bijam byaktimisam ganitam cha bande.

(I salute that which Samkhya perceives as endowed with the qualities of personhood and the producer of intellect, and which is the seed of not only the manifest world but also unmanifested mathematics.)

In a science not bound by platonistic assumptions about necessary existence of entities or by Cartesian assumptions about necessary relations between commensurability and existence, explorations would naturally proceed towards the study of operations by which any kind of number can be generated within a variable or invariable field, whether or not they exist or be exact. Greater emphasis, therefore, is to be found on operations in Indian mathematics. In Sridhara's *Patiganita* (199 AD), a text has significant influence on all later texts, we find the names of various mathematical operations summarised as the very beginning of the work. Sridhara enumerates 20 types of operations that can be performed to generate numbers, and nine types of operations performed for groups or types of numbers [Sridhara *Patiganita* 900 AD, p 2]. Much has been said on the development of the decimal system and the number zero in India. But what is important is that '0' was never conceived as a number earlier, it was conceived purely as an operation. Its initial sign, a dot (a 'bindu'), has deep metaphysical significance in Tantra, a school of philosophy closely related to Samkhya. Thus, for example, just as the point in 1.2 in the decimal system does not denote a number but the fact that the 10th part of two is co-joined with unity, '0' in 102 in Aryabhat's system would signify the operation of co-joining 2 with 100. A debate whether zero is a natural type, of the western type, could never arise in Indian mathematics In *Bijaganita*, Bhaskara-II tells us:

Atra rupanam Vayyvaktanam chadyaksharasyas palakshanartha lekhyani vani rinagatani tani urdhavavinduni cha.

(Here, when the values of variables are unknown, express them as letters, such as 'ka', 'na', etc., but when they are negative signify the operation with a bindu (zero) above the variables, such as ka, na, etc.)

The emphasis on the fundamentality of operations not only overcome the problem of incommensurate numbers but also allowed a liberal attitude in which the principle of excluded middle did not become a binding axiom. This avoided the problems of Cartesianism in which truth and falsity are connected with existence and finally exact determination. Since operations and their products are correct or incorrect, approximate or exact, the question whether or not the principle of excluded middle applies to the realm of numbers would exhibit a misunderstanding from within the Indian perspective. The question would be a categorical mistake and not just semantic. The right type of question would ask: the acceptance of what type of operational rules then become a matter for theory of justification, 'nyayasastra', part of which is the theory of proof, 'pramanasastra', and not a matter for theory of truth. The criteria for the correctness or incorrectness of rules would be grounded in their power to determine reality (and consequently predict) as well as in their power to construct. This type of constructivism is pragmatic in approach. If the rules fail to predict or construct they would be incorrect, not false. The inconstructibility of a numerical value does not necessarily reflect on the nature of the value in this scheme, it may reflect on the inadequacy of the operational rules. The incommensurability of real numbers, or the negative or fractional values of others, hence, did not bother Indian mathematicians since such values were constructable by operations.

The employment of the criteria of determinability and constructability in mathematics has drawn the attentions of many researcher to the use of similar criteria in linguistics and other traditional Indian sciences. Navjyoti Singh (1984), for example, has emphasised the homology that exists between Indian linguistics and mathematics. That Indian linguistics and mathematics are homologous in fundamental aspects is undoubtedly true. But the reasons for this similarity does not seem to lie merely in the influence that one science had on the other. A deeper observation reveals that even in Indian musicology, where the properties of incommensurate 'srutis' (the smallest difference in pitch) are studied, similar criteria of determinability, constructibility, and operational feasibility have been employed. Similarly, Indian logic did not contend itself with finding the meta-rules governing the truth or falsity of propositions. It sought the foundations of probabilistic and multivalued logics. The reason for the homologous foundations of these varied sciences must, therefore, be deeper than the mere mutual influence.

The reasons seem to me to be metaphysical. This paper is not the occasion to discuss them in detail. However, the bare essential points need to be noted, since these beliefs have determined the development of not only the sciences and arts but also the socio-economic lifestyle.

The Greeks, and subsequently the Judeo-Christian beliefs perceived the world as ontologically distinct from god and also as a finished work of his. The Indians perceived the world as ontologically continuous with god (brahman) and not as a finished product but as a continuously transforming determination of his being in becoming. This is the most fundamental line of thought which divides the Judeo-Christian-Islamic world view from the Indian one, reflected in Hinduism, Buddhism, Jainism, Sikhism and all other systems of belief emerging from India. Since the products of god were ontologically finished or complete the Greeks were uncomfortable with incommensurate numbers or entities. The Indians on the other hand, naturally expected and accepted incompleteness and indeterminability. The nature of brahman or the 'padartha' being indeterminate, incommensurability was expected in mathematics, linguistics and music. Likewise, while the Greeks divided the simplest elements of phenomena into existing and complete atoms or monads, the Indians accepted not fully independently existing 'anus', atoms. The force of these basic beliefs is pervasive. While the ideal of Greek art, and western art for long, was recreation or representation of the existent, the aim of Indian art has been to create the ideal and thus through the process of becoming, bringing into existence something which was not perceived or conceived in existence before.

These remarks are meant only to underline the reasons for the homology that one finds in the development of various sciences in India, without any claims to finality. However, before we can begin to draw lessons for mathematics from this homology, it will be necessary to first briefly recapitulate it, so that we know exactly wherein the homology manifests itself.

The notion that there are kshetras (fields) in which the 'kshetrgyan' (operators)

function, is not applicable to mathematics alone. It is a generic epistemic notion which can be interpreted for any type of particulars. Thus we find its application in modern physics in expressions such as 'unified field theory'. What is the meaning of 'field' here? What does it refer to? Whatever it refers to, it is in a similar sense that the term has been used in Samkhya philosophy. In quantification and determination of the field Indian mathematicians found that operations yielded commensurate and incommensurate values which were signified by numbers. In communication and transfer of information within the field it was discovered that operations (meta-rules) yielded determinate results, such as propositions or statements, as well as indeterminate results, such as 'dhatus', the simplest elements of propositions. As concerns music within the field, it was discovered that there were determinable srutis, 'swaras', as well as indeterminate 'srutis', on which operations had to be performed to yield 'ragas'. It must be noted that these discoveries were not a priori, but empirical. The numerous phonetic elements with which texts of Sanskrit grammar, such as *Laghusiddhantakaumudi*, begins were discovered after close scrutiny of language. Similarly, the *Natyasastra* describes experiments with numerous 'vinas' (stringed instrument) with diverse lengths of strings to determine the smallest difference in pitch and thus to determine the srutis.

In linguistics the most significant development arose from the realisation that momentary syllablisation of sounds have the property of adding into phonetically and semantically meaningful utterances. The natural question to arise was: what are the simplest phonetic and semantic elements, and how does the process of addition of (the being of) these simplest elements take place to become meaningful propositions? The 'siksa' and 'pratisakhya' class of literature deal with the theoretical aspects of utterances. As concern semantics, the central problem, such as in Bharathrhari's *Vakyapadya*, is not how propositions become true, but how a series of sound patterns add up in time to become meaningful. The situation in music is similar: how do the simplest elements of sound, srutis, add up in time to produce 'rasa' (emotions)? *Rg Pratisakhya* (600-400 BC) deals elaborately with the meta-rules, 'paribhasa', of how utterances are joined together to yield meaningful results.[2] Bharatmuni's *Natyasastra* and Sarangdeva's *Sangitaratnakar*, among other musicological texts, deal elaborately with the question what sort of meta-rules are appropriate to join srutis together so as to yield melodies. In 'Pindotapatiprakarana' (2.2) chapter of *Sangitaratnakara* Sarangdeva sees a direct relation between the semantic meta-rules of language and music. In musical terminology the 'field' is referred to as 'nada-brahman'; Sarangdeva states in this section that language and music are the results of the operations of different operational meta-rules on the same 'nada-brahman', hence their foundations must be similar. It is also important to notice the parallels between the classifications of meta-rules for language and those in law, which although apparently disparate, are fundamentally similar because in law too rules apply to determine actions in an indeterminate social field. *Rg Pratisakhya* has three classes of meta-rules ('paribhasasutras') applicable to language, (a) 'samanya-sutra' (universal rules), (b) 'apavada-sutra' (rules for exceptions), and (c) 'nipatana-sutra' (counter-rules). The *Dharmasastra* texts (jurisprudential codes) make exactly similar classification of meta-rules into: 'samanya dharma', 'apavada dharma' and 'nipatana dharma' [For a discussion of different types of dharmas see P V Kane 1941]. These coincidences are not accidental, but reveal a deeper unity in beliefs.

The most significant thesis concerning the simplest element of propositions that pervades Indian linguistics is the one assigned to Bhardwaja: the thesis that the root or stem of a proposition is the verb, not the logical subject, the noun. Saktayana developed the idea that all words, including nouns, have verbal roots (700-500 BC). The 'Nirukta' (etymological tradition) that followed Saktayana, notable amongst which is 'Yaska nirukta', developed this thesis in various directions. The most significant breakthrough came through Panini's 'Astadhyayi' (600-400 BC), which took a whole sentence and not a word as the simplest unit in language. Panini developed his 'karaka' theory of language in which he attempted to set forth the rules which relate the variable that can stand for a noun with the variable that can stand for a verb. The deep structure provided by Panini's grammar provides the possibility of semantic interpretations and of recursive meta-rules, unlike the Chomskian scheme which remains at the level of syntax. The emphasis again is on the operational rules which can generate meaningful sentences rather than on characterising accomplished existential propositions.

The parallels between the approach in mathematics and in other sciences can be multiplied. What is important to note are the following methodological similarities:

(a) In the various sciences operational rules rather than existential propositions have been the matter of primary concern.

(b) Unlike the Greek tradition where mathematical propositions have an exceptionally higher ontological status, almost amounting to eternal truths, the status of such propositions in the Indian perspective was the same as the status of higher propositions about language or music; it faced the same problems as any other recursive set of rules would.

(c) Since recursive meta-rules can be applied to any field in which determination and operational construction is feasible, the syntax of the meta-rules by itself cannot decide to what sorts of particulars they can apply. In other words, the Indian theoreticians were already intuitively aware of the Lowenheim-Skolem theorem; they did not have the apparatus or the need to prove it; they were already practising what would be true as consequences of this theorem, namely, not confusing axiomatisation and deducibility with mathematics, and specially numbers

(d) The most significant methodological insight was that the property of co-joining or addition of the successors was not the property on any one specific series but the property of any field in which the values of undetermined variables could be determined by operations. In the field of 'nada', thus incommensurate srutis progressed in succession in time in such a way that they added up to commensurate musical notes and melodies, whose modalities could be ascertained by recursive operational rules to yield ragas. In the same field, with a different set of rules modalities for patterns of communication could be brought about, in which the succession of atomic utterances added up to yield words and sentences in time. The property of additivity, which in the field in which matter is considered is called 'gravity' is thus not the property of matter alone, it is the property of all determinable and discernible elements in the field, whether conceived as material or non-material. Just as elements of 'matter' add up to produce new forms, elements of sound add up to produce new melodies or statements as we produce them or when they get produced. With respect to different considerations about the field, there are different ways of expressing the process of additivity. With respect to human beings we say: they are naturally gregarious, leave some individuals together and they will soon form a society. With respect to matter if we wish to explain this process

of additivity by saying that there is a force of gravity pulling things together, we have not said anything more than that things are naturally endowed with the property that they will add up together. Whether Newton's principle of gravitation is a synthetic proposition of observation or an analytic a priori proposition of definition still remains to be decided within philosophy of science. Indian musicians defined the smallest bit of sound as the least difference in frequency perceptible by the human ear. Mention of the smallest bit of sound may seem abstract as compared to smallest bit of matter. But we must keep in mind that the description of matter in modern physics makes it just as intangible as sound. Now we are even talking of smallest bit of information in Information Theory. If this is intelligible surely the smallest bit of any other phenomena is too.

Let us turn now to see what these various observations from within the Indian perspective have for modern theory of numbers.

V
Consequences of Indian Approach

The thesis that I have built up on the basis of the Indian approach has the following significant consequences:

(1) Peano's first axiom that '0' is a natural number has to be dropped. There is no basis for this. '0' can be conceived as an operation.

(2) Peano's second axiom that every natural number has a successor has to be radically modified. Both Russell's interpretation of it that the successor of n is n+1, and Frege's version that there is one to one correspondence between the successors and the extension of the concept, are arbitrary. This can be assumed to be so by definition but to assume that this reflects how things are in reality would be a mistake.

(3) The existential assumption in Peano's second axiom that numbers exist is unnecessary. It is sufficient if they can be constructed as results of mathematical operations, whether or not the result actually represents something in existence. To show that it does so, additional semantic assumptions would have to be introduced.

(4) With the modification of first, second and third assumptions Peano's third and fourth axioms also become unnecessary.

(5) The principle of mathematical induction, Peano's fifth axiom, goes along with the successor axiom. In itself the axiom does not tell us what 'property' is being attributed to members. But if it is so interpreted the successor of n must have property of being n+1, problems similar to the second axiom would arise.

What I am suggesting in short is that number theory can rid itself of the problems it presently faces only by making a radical change like classical geometry to non-Euclidean geometry. Whereas geometry has made this leap, number theory still works with the classical Greek assumptions of existence and exactness. That is, while geometry has discarded Platonism and Cartesianism modern number theory is still hampered by it. However, this can be done only if one moves from cognising numbers from the Greek way to the Indian way. The Indian perception does not demand existential presuppositions. I also believe that the problems in modern number theory, such as Golbach's theorem and Fermat's last theorem, can be solved only after number theory becomes 'non-Euclidean' in the sense that it does not assume Platonism and assert or claim knowledge of the reality, but only of operations performable on it.

The philosophical foundations for a general theory of numbers would have the following characteristics:

(1) First it would have to define the basic operator and show that all other operations are reducible to the basic operation. For example, when additivity is taken to be the basic operation, multiplication is shown to be the summation of additions, division as the multiplication by the inverse, and so on. There are various schemes of doing this.

(2) It would then be required to apply this scheme to the number domains, that is, to the field in which the operations yield numbers. Such a requirement can be satisfied by the following basic axioms for number theory which utilises the notions of additivity and successor but avoids any existential claim:

(a) The successor of an infinitesimal numerical value is another such value. (Infinitesimal numerical value is the smallest magnitude, just as points are in geometry; such values would be the smallest result that mathematical operations can yield.)

(b) The successors have the property of additivity, i e, the principle of addition applies to them. (Note that the Peano-Russell scheme uses this principle, signified by the sign '+', but does not state that an additional assumption is being made here.)

(c) Successive addition of infinitesimal values can result in either accomplished or unaccomplished numbers (numerical values). A number is said to be accomplished when it can be divided only by itself or unity, i e, the addition of even one further infinitesimal value will make it divisible by a value other than itself. One may call them stable and unstable numbers, or any other terminology to signify this property.

The above axioms are sufficient for the purposes of number theory. The accom-

plished numbers are the prime numbers, and rightly called so. Mathematical operations of addition and subtraction (or other operations) can yield the full 1,2,3,... integer series, which have hitherto been called natural numbers. In this scheme the prime numbers are constructs from them. Once the 1,2,3...series is generated one can apply Dedekind's or some other such similar operational scheme to generate all other types of numbers.

Being so used to viewing 1,2,3,...series as the 'neutral' series one may find it difficult to accept my suggestion that the disconnected prime number series is the basic series. But this is a matter of education, or rather miseducation. We have been repeatedly told that the progression of n+1 is natural, there is nothing in nature to suggest this. We have already noted the Greek and Cartesian basis of this misconception.

Once we understand that the prime number series represent the series of accomplished numbers the problem of internal and external relations of numbers, mentioned earlier, is easily solved. The reprogression of the elements (of matter as well as of musical notes, besides other elements) turns out to be in terms of prime numbers because they represent accomplished or stable states of additivity. We must keep in mind that numbers are not entities, but results of operations on a variable field which could be interpreted for any particulars. To ask why stable additions (accomplished states) of infinitesimal elements of objects have values represented by prime numbers, is to go beyond mathematics. The solutions must be sought in physics or metaphysics. Mathematics limits itself to uninterpreted rules and meta-rules that may apply to any field, the accomplished state of any element is represented here only as a result of operations which yield values not divisible by any value.

If the virtue of this foundational scheme is to be judged, it can be judged from the fact that a problem such as the Goldbach's theorem is hardly a matter of much surprise here, it follows trivially from the basic axioms.

As noted, all unaccomplished numbers are nothing but the products of operations on prime numbers, that is, they can be generated by mathematical operations on prime numbers. Unaccomplished numbers include all odd and even numbers (which are not prime numbers) in the 1,2,3,... series. All unaccomplished (even) numbers, therefore, are the products of accomplished (prime) numbers. Since addition is the simplest mathematical operation and other operations can be reduced to it, all even numbers can be represented as sums of prime numbers. The 'first principle of arithmetic': that all numbers can be resolved into their simplest factors which are prime numbers, also follows from this. They can be so resolved because in the first place they were nothing but products of prime numbers.

This section will conclude by noting two important points. Although the Indian approach is a constructivist approach, it does not face the problems which Kant's constructivism faces. Since numbers are not conceived as entities the problem about their existential status does not arise. The question: do infinitely large numbers exist, would be interpreted as: do operations exist by which infinitely large numbers can be generated? The answer would be; yes.

Secondly, thinkers have often asserted that if one drops the principle of excluded middle what happens to classical mathematics, does it go over-board? [See for example Baker 1964]. Within this approach the answer would be, no. Peano's axioms which assume the principle of excluded middle would be a special case (interpretation) of the general axioms of number theory, just as Euclidean geometry is a special case of non-Euclidean geometry, or Newtonian physics of relativistic physics. It would be a special case because, besides restricting the domain of application (in which counting can be done by applying integers) it assumes a successor relationship also for the requirement of counting, not for characterising nature or the whole of reality. In other words, the Peano-Russellian scheme derives and applies to the necessity of counting, just as physical (Euclidean geometry) has its basis in the necessity of measuring.

Notes

1 Most sets are not members of themselves; the set of cats, for example, is not a member of itself, because the set of cats is not a cat. However, there may be sets which do belong to themselves, e g, the set of all sets. Now, consider the set A of all those sets X such that X is not a member of X. Clearly, by definition, A is a member of A if and only if A is not a member of A. Thus, A is both a member and a non-member of A. This is a statement of Russell's paradox. For a discussion of this problem see Kurt Godel (1944).

French Jesuit Scientists in India

Historical Astronomy in the Discourse on India, 1670-1770

Dhruv Raina

The intellectual activity finally culminating in the grand theoretical syntheses of the celestial sciences towards the end of the 18th century followed a century's toil undertaken by Jesuit scientists and traveller's posted outside Europe. This essay briefly addressed the endeavour of the French Jesuits who landed in India during the late 17th and first half of the 18th centuries. The Jesuit scientists of the period were inaugurators of a discourse on India and Indian historical astronomy marked by ambiguity, where fascination and dismissal so together; where the enchantment with the new world and its distinct knowledge forms provide the occasion for enriching the self in cognitive and cultural terms, and through an act of distantiation, of redefining the self as superior.

A true man of the church, he intended to prove that the Bible had not lied, but also a man of science, he wanted to make the Sacred Text agree with the results of the research of his own time. And to this end he had collected fossils, explored the lands of the Orient to discover something on the peak of Mount Ararat, and made very careful calculations of the putative dimensions of the Ark.

–Umberto Eco, *The Island of the Day Before*.

THE 18th century legacy of the history of science for long ensured that the role of the Jesuits in the advance of modern science was underplayed. This lack of attention was partially the product of an ideological fixation concerning the antagonism between science and religion. In fact, late 19th and early 20th century historiography had been habituated to the idea that science and religion were pathologically opposed to each other. The overplayed Galileo episode has for sometime been interpreted by historians of science as being a specific manifestation of the relation between the views of some natural philosophers and the interests of religious institutions [Wallace 1984]. Furthermore, throughout the medieval ages into the age of modernity institutions of Christian religion had evolved with traditional bodies of natural knowledge [Shapin 1996: 136]. The *ecumenical Merton thesis* has done a great deal to deflect our simplistic fixation with the conflictual model. According to this thesis, where "science prospered in early modern times, it derived important support and reinforcement from organised religion" [Heilbron 1989: 11]. A variety of astronomy that emerged in Jesuit institutions in Italy in the 17th century gradually blossomed into an active tradition of Jesuit science in France in the 18th century. This tradition has been little researched [Harris 1989: 41]; despite the fact that the Jesuit writings on the sciences constitute a fairly substantial corpus.

Between the years 1600 and 1773, the year when the Society of Jesus was suppressed, Jesuit scientists had authored more than 4,000 published works, about 600 journal articles appeared after 1,700, and about 1,000 manuscripts were available. The society's known publications include 6,000 scientific works covering areas such as Aristotelian natural philosophy, medicine, philosophy, astronomy and mathematics [Harris: 41]. The scientific writing of the Jesuits fall into six broad categories. Off the six, three of immediate concern to us include textbooks and treatises on Euclidean geometry and mixed mathematics, treaties, opuscules and journal articles on observational astronomy, and academic publications on experimental and natural philosophy [Harris: 42]. About 40 per cent of the Jesuit literary output from the foreign apostolates dealt with astronomy. These included important eclipse observations, other celestial events such as the transit of Venus, and the correction of longitudes of important places.[1] These efforts furthered the determination of the shape of the earth [Harris: 56], and in a less direct way provided the grounding for the finalisation of celestial mechanics, that more or less closed the era of Laplacian physics by the 1830s [Pyenson 1993: 4].

Amongst the French members of the Society of Jesus were many astronomers.[2] These contributions included the determination of latitudes and longitudes for all of China, the observation of solar and lunar eclipses as well as of eclipses of Jupiter's satellites, the passage of Mercury through the solar disc – to mention a few. These Jesuit astronomers also initiated studies on ancient Chinese records and observations, in order to analyse Chinese chronology. In fact, it was a similar interest that led them onto the study of Chinese, Indian and Egyptian history [Han 1995: 491]. These astronomical observations in Chinese were often used to determine the accuracy of Chinese history, and hence these Jesuit scientists were the progenitors of Chinese *historical astronomy* [Han: 492].

The historian of science, S N Sen, remarked in an important paper, that unlike the case of China, the Jesuits in India made little contribution to the growth of modern science [Sen 1988: 114]. However, some of Sen's own research into the history of astronomy requires a revision of the hypothesis. The Jesuit project in India was certainly not on as grand a scale as it was in China. Nevertheless, despite internal dissension within the Jesuit order, witnessed both in India and China, the Jesuits inaugurated the historical inquiry into ancient Indian astronomy (as they did in China) by providing both the impetus and material for French savants and astronomers to develop their *histoires de l'astronomie*. Furthermore, the efforts of French Jesuit astronomers in India and China mutually complemented each other. The institutional and administrative organisation of Jesuit science was ensured through the disciplinary structures of the Society of Jesus that reinforced a 'high level of group coherence and loyalty' [Harris 1989: 39]. Jesuit superiors stationed at foreign apostolates were thus required to send detailed reports and edifying news, in the hope of winning over new apostates, to Rome and western European metropolises [Harris: 57].

Three different interests, Jami points out, converged in the formation of the French Jesuit missions, and subsequently deciding their research agenda. In the first instance the director of the Paris observatory in the 1670s Gian-Domenico Cassini (1624-1712) submitted a proposal

to the minister Colbert to send Jesuits to China to make some astronomical observations, and to advance their knowledge of latitudes, longitudes and magnetic declinations. Secondly, the French king was compelled by French Jesuit interests to augment support for Catholic missions abroad, since it was binding upon the "Church's eldest daughter", to do so. The third, was part of a larger proposal to send French embassies to Asian courts [Jami 1995: 495]. One of the missions that was sent to Thailand finally landed up in Pondicherry.

A leading French astronomer stationed in China was Pere Antoine Gaubil (1689-1759), whose astronomical researches had exercised influence on the French astronomer, theorist and mathematical physicist, Pierre Simon Laplace (1749-1827). Gaubil researched into traditional Chinese astronomy, and proposed that the changing obliquity of the ecliptic should be adopted from Chinese astronomical sources. As indicated earlier, Gaubil was instrumental in creating a formation that one could call 'historical astronomy' – for convenience we shall take the term to designate the project of probing historical records for celestial events that could retrospectively result in the revision or validation of contemporary astronomical practice. This is evidenced in some of his important books such as 'Histoire abregee de l'astronomie chinoise', Paris, 1729; 'Histoire de l'Astronomie chinoise' that first appeared in volume 31 of the *Lettres edifiantes*; and *Traite de la chronologie chinoise* – while this manuscript was sent to Paris in 1749, it was Laplace who discovered a copy in the library of the Bureau des Longitudés [Dieny 1995: 503].

Pere Gaubil was in constant touch with the French Jesuit astronomer and cartographer Pere Claude Stanisla Boudier (1687-1757) stationed at Chandernagor in India. Boudier's reputation as an astronomer earned him an invitation to Jai Singh's court in 1734. During his journey to and sojourn at Jaipur, he, like his counterparts in China determined the longitude of 63 Indian cities, in addition to measuring the meridional altitudes of a few stars. [Ansari 1985: 372]. In addition, he observed the first satellite of Jupiter on April 2, 1734 at Fatehpur, and again at Jaipur on August 15 of the same year. He also observed the solar eclipse of May 3, 1734 at Delhi and had earlier reported the lunar eclipse of December 1, 1732. Pere Gaubil however considered that Pere Boudier's estimates of the diameter of the sun were on the higher side. It appears, that just as the French Jesuits provided the last accurate figures of the longitudes of the leading Chinese cities, Boudier did the same for Delhi and Agra [Ansari 1985: 372].

The historian of astronomy, Ansari tries to draw a parallel between the perseverance of the Jesuits in India and China. He is right in observing the neglect of scientific textual scholarship of the Jesuits in India; but then the phase of European textual scholarship in and on the sciences of India really commenced much after the Society of Jesus had been suppressed.[4] Regarding the place of Jesuit scientists in the court of the Chinese emperor and that of the Moghuls, Ansari's remarks are less conclusive. But the third point that the French Jesuits in India, unlike their Chinese counterparts were not good scientists and were not in contact with the best scientists in Europe is at best an overstatement [Ansari 1985: 374-75]. It is true that not all the Jesuit astronomers in India were in touch with the leading French astronomers located at Paris. It is nevertheless incontestably true that their reports and records became the source material for three subsequent generations of French astronomers: Le Gentil, Bailly, Laplace and Delambre. This in any case does not detract from the point that the Jesuits did not bring the Copernican revolution to the east, that its impact on Indian astronomy was minimal [Sharma 1982: 351]. We now come to the specific context of the French Jesuits who came to India, their writing, who they were and what source material they provided on the ancient astronomy of India.

Founding of Three French Jesuit Missions

The tenure of the European Jesuits in India dates back to the 16th century. But our purpose is not an essay that constructs the entire Jesuit corpus as one homogeneous text. On the contrary, internal political and doctrinal differences emerged within the Jesuit order as a consequence, not only of different intellectual traditions and social orderings, but more importantly of the rivalry between different European states.[5] In this particular case, we shall not discuss the programme of the Portuguese Jesuits in Goa in the 16th century.[6] The focus of our attention are the French Jesuits who arrived in India towards the end of the 17th and the early decades of the 18th centuries.

The counter reformation provided the backdrop for the first Portuguese Jesuits who arrived in Goa in the first half of the 16th century; and were propelled by the forceful colonising and evangelising impulse, manifest in rituals of 'slash and burn' evangelisation [Zupanov 1993: 136]. Another interpretive tradition found its expression in the evangelical efforts of the Italian Jesuit, Roberto Nobili, founder of the Madurai Mission. This strategy, Zupanov calls the 'adaptationist method of conversion' – *accomodatio* – was developed by Italian missionaries for Asian countries [Zupanov 1993: 124], and possibly came out of the Collegio Romano where this art of Jesuit conversion was rehearsed. This method was premised upon a humanist theological universalism [Zupanov 1993: 123], that was quite a variance with that of the Portuguese order. This strategy of *accomodatio* was in measure adopted by the French Jesuits who came to India and founded the Missions at Pondicherry, Mysore and Chandernagore. With the democratisation of knowledge that marked 17th century Europe, the lower literate social orders from whose ranks some of the Jesuits came, were also engaged in the colonial enterprise. These figures came around to considering themselves "superior to any learned Brahman", and found the "colonial setting fertile ground for this kind of psychological...official promotion" [Zupanov 1993: 143].

In the late 17th century, there were two distinct phases marking the relationship between French traveller's and Jesuits with princes of several Indian states. The first was a period of 20 years, from 1666 to 1686. The French saw the geographical expanse of the Indian subcontinent as politically divided in two: the Mongol ruled India of the north that was more or less independent from 'l'Inde pathane' and 'l'Inde carnatic'. As far as the French were concerned this period coincided with that of the relative prosperity of the Compagnie royale francaise, which indicated that the French had the necessary resources for the creation and extension of their commercial interests [Duarte 1932: 195]. Their first explorations were purely of a territorial nature, and the political leader adopted a policy of reconciliation [Duarte 1932: 196]. This was reflected even in the Jesuit programme of evangelisation.

The second period also extended over 20 years: from 1686-1706. Difficulties began appearing in 1677 and climaxed in 1679. By 1706 the Compagnie des Indes Orientales had all but disappeared, and was reconstituted in 1719. But this time it did not survive through its own efforts, having sold its monopoly to private societies. During this period French policy was limited to prudently and surreptitiously increasing the number of their posts, while awaiting favourable times [Duarte 1932: 196

The death of Saint Francis Xavier appeared to have marked the deceleration of the Portuguese proselytising fury in India. It was for Pere Roberto de Nobili to show that the contempt of the indigenous population towards the missionaries was the cause of the decline of missionary effort. He then set about reversing the trend. It was for him to inform Rome that: "We imagine that these people are ignorant, but I assure you that they are not. I am actually reading one of their books in which I learn philosophy anew almost in the same terms as I studied it at Rome, though of course, their philosophy is fundamentally different from ours" [quoted in Zupanov 1993: 126]. This hermeneutic discernment sought to propose that Hindu customs and rites could not only be incorporated into Christianity, but justified within Christian theology [Zupanov 1993: 127]. Zupanov conjectures that Nobili's aristocratic background possibly accounted for his extra-sensitivity "in detecting and acknowledging...non-European analogues". This proto-emic approach of seeing the world through the eyes of the other may have licensed "both epistemic condescension and intellectual curiosity" [Zupanov 1993: 143].

Geodesy and Chronology in *Lettres* of Jesuits

The French Jesuits arrived in their evangelical role on the Coromandel coast; the French king having sent these missionaries versed in the sciences of Europe to India. Peres Tachard, Fontenay, Bouvet, Gerbillon, Le Comte and Visdelou were the first French missionaries to arrive in India. As the 18th century commenced there were three large French missions located in southern India: the Madurai missions founded by Nobili in 1608; the Mysore mission that was first run by the Dominicans and later by the Franciscans. Neither of them left traces of their work, and it was left to the French Jesuits to refound the mission [Bamboat 1933: 85]. The third was the Carnatic mission that commenced at Pondicherry and was founded by members of the Society of Jesus who landed at Pondicherry after they were expelled during the course of a revolution in Thailand. The most notable of these Jesuits were Peres Tachard, Mauduit[8] and Bouchet [Bamboat 1933: 85].

Pere Tachard was among the first French missionaries of the Society of Jesus to choose India as the "theater for their apostolic work", having been sent by Louis XIV to Thailand in 1685. He learnt the language of the country and in 1686 accompanied the French ambassador to Thailand to meet Louis XIV and the Sovereign Pontiff. He returned to Thailand in 1687, but two years later following a coup against the king and his minister, he retired to Pondicherry with other missionaries and remained there till 1693. When Pondicherry fell to the Dutch, he was arrested and sent to Europe. He returned to Surat in India in 1696 and later founded a small seminary at Chandernagor [Bamboat 1933: 89]. He went on to found the Carnatic mission and sent Jesuits to the hinterland of the province. He had a reputation for making accurate astronomical observations that are contained in his diary and letters; in addition to which there are important remarks on the geography of the region [Bamboat 1933: 90-91].

In fact, in the year 1687 he visited Louis XIV in Paris with the French ambassador to Siam, M de la Loubere, and carried a Sanskrit manuscript from Thailand. This manuscript contained rules for the computation of the longitudes of the sun and the moon. In its own time, it was to exercise the scientific skills of Gian-Dominique Cassini, then heading the Paris observatory, before he could translate the computational rules contained therein into the language of modern astronomy [Sen 1985: 49]. Cassini's computations were presented in the *Memoires* of French Royal Academy. Based on the ratio of omitted lunar days to the total number of days, that Cassini took to be 11/703, he calculated the synodic month to be 29 days, 12 hours 44 minutes and 2.39 seconds. Having established that 228 solar months were equivalent to 235 lunar months, Cassini showed that the metonic cycles were known to the Indians who had generated these astronomical rules [Sen 1985: 50]. The sun underwent 800 revolutions over a computed period of 2,92,207 days, and Cassini estimated the length of the sidereal year to be 365 days, 6 hours, 12 minutes and 36 seconds. Since this figure agreed with the value obtained in the *Paulisa Siddhanta* of Varahamihira, it was much later argued that these computational rules were derived from the latter text [Sen 1985: 50].

Pere Papin was one of the first missionaries in India and was appointed Superior in Bengal in 1711. His letters and writings provide important information on the industry and medical practices of the region.[9] Like Pere Tachard, Pere Bouchet was a member of the expedition to Thailand in 1687. But the revolution of 1688 brought him to the province of Malabar. He was later sent to the Madurai mission. [Bamboat 1933: 93]. Bouchet opened up a discussion on metempsychosis and, shall we say, comparative philosophy. His detailed letter to M Huet, the former Bishop of Avranches [*Lettres*, 1810, Tome 12: 136-93], discussed the points of convergence of Pythagorean and Indian metempsychosis. As a Catholic, he was naturally perplexed by the doctrine of transmigration of the soul, and so embarked on a comparative discussion on the doctrine of the soul amongst the Indians, Pythagoreans, the Platonists and the Christians, and naturally sets up a distance between the former three and the latter [*Lettres* 1810, Tome 12: 145-53]. But what is most significant, is the preoccupation with, on the one hand eschatology, and on the other Indian cosmology, the theory of the beginning and the end of the world, the Indian book of genesis [*Lettres* 1810, Tome 12: 155]. This interest persists into the secular history of astronomy produced by non-Jesuit French savants, and is possibly the signature of the 18th century fascination with the origin of the universe, the commencement of terrestrial time. In astronomical terms, this preoccupation moves along a fluid boundary between the scriptural and the scientific, and is reflected in the second preoccupation of the 18th century mind that is articulated even within the archive of French Jesuit science, and this has to do with chronology.

This engagement with chronology is not to be disassociated from traditional cosmology. For if chronology dealt with the unfolding of time, it temporally situated the unfurling of human history. For those nurtured in Catholic doctrine, human time, like history, began after the Deluge. Consequently, the search for analogues of the Noahic Deluge figures in their reading of other scriptural traditions, as if the Deluge was a mythopoeic universal that informed our meditations on celestial time [*Lettres* 1810, Tome 12: 157]. In terms of the scientific interpretation of the Bible, as the history of science moved towards becoming a secular discipline, the Dispersion of Nations and the Deluge were to be dated. Hence these preoccupations were not specific to Antoine Gaubil for whom answering these questions required the study of the history of astronomy in China [Dieny 1995: 504], but of the Jesuits in India and the mental landscape of the 18th century scientific imagination, rooted both in history and the Bible.

Expedition of Peres Pons and Boudier to Jaipur

Pere Pons arrived in India in 1726 and after spending a few years in Thanjavur was appointed superior of the French Mission in Bengal. Other than compiling a Sanskrit grammar, and a treatise on

Sanskrit poetics that was sent to Europe, he visited Delhi and Jaipur with Pere Boudier, mentioned earlier, to make some astronomical observations [Bamboat 1933: 95]. We find an account of this in a note entitled 'Observations: Geographic Expedition Undertaken in 1734 by Jesuit Fathers During Their Voyage from Chandernagor to Delhi to Jaipur' in the *Lettres Edifiantes* [*Lettres*, 1810, 15: 269-91]. In fact, this is a report on the very observations mentioned earlier in our discussion on Gaubil. The report begins by pointing out that the raja of Amber, Sawai Jai Singh, a savant in astronomy, for whom the Jesuits had undertaken this expedition, had a number of astronomers working for him [*Lettres* 1810, 15: 269]. Jai Singh had requested the superior general of the church at Chandernagore, Boudier, to send Jesuit fathers stationed at Chandernagore to make some observations; and so Pres Pons and Boudier set out for Delhi and Jaipur

The motivations behind this expedition have been recorded by Eric Forbes [Forbes 1982].[10] Jai Singh's first contact with European astronomy appeared to reinforce his conviction that his large masonry observatories yielded more accurate results than iron astrolabes and sextants. He failed initially to appreciate the point that the source of his error was a faulty theoretical basis for computing lunar and planetary motions adopted by La Hire. In his letter to Pere Boudier, Jai Singh informed the former that he recognised this failing on mastering La Hire's book, and then wished to investigate whether other tables existed, and if so its underlying theoretical principles [Forbes 1982: 238]. And while Boudier was a "skilled telescopic observer", he was not equipped to answer Jai Singh's queries [Forbes 1982: 238]. Peres Boudier and Pons agreed to undertake the 1,000 mile journey to Jaipur on January 6, 1734 in the hope that they could establish a Christian mission at Jaipur. They reached Jaipur nine months later, but were forced to return shortly on account of ill health. When they were not making their observations, Forbes writes, they spent their time trying to convince the local brahmin's of "Indian astronomy's indebtedness to ancient Greek culture" [Forbes 1982: 240].

The document in the *Lettres* reports their observations of latitudes and longitudes of about 60 Indian towns and cities, the course of rivers they encountered during the course of their journey, the occultation of the Jovian satellites, and finally their observation regarding two eclipses that occurred in 1734. Appendix I provides a list of the latitudes and longitudes of some of the cities and towns obtained by them. However, there is an error of 35" in his latitude measurements of the observatory sites at Jaipur and Delhi [Sharma 1982: 347].

Throughout the 18th century one of the crucial obstacles for reconstructing the geography of India was the paucity of data on geographical latitudes and longitudes. The condition was further exacerbated by the non-standardisation of the Indian mile *vis-a-vis* the European mile, given the fact that the Indian mile varied from region to region of the country [Sen 1982: 1]. The Jesuits set about mapping this terrain. The method employed for determining these parameters required that the latitude and longitude of Chandernagor be known through a large number of astronomical observations. The route followed was carefully mapped as they travelled from one station to a neighbouring one. All along, the time was scrupulously noted with a time piece on hand, that was calibrated for the Paris meridian. The time spent was then compared with the speed of the vehicle. In addition, the detours along the route were carefully marked, and the speed of the air noted, a compass provided the directional readings [*Lettres* 1810, 15: 273]. This procedure was repeated all the way from Chandernagor to Kassimbazar to Patna to Agra to Delhi till they reached Jaipur. From Patna to Agra they could not use the compass since they were travelling by cart. Their observations had thus to be supplemented by surveying the course of the sun. Furthermore, throughout the voyage, as is done on sea, they had to correct their estimates by obtaining the latitudes of several locations [*Lettres* 1810, 15: 274]. No observations were made between Chandernagor and Kassimbazar since they covered this distance by the waterway, and the meandering path of the Ganges would have required that they spend a great deal of time to obtain a just estimate. In addition, they spent some time covering the distance at night [*Lettres* 1810, 15: 274. On examining a number of naval maps, they found that Calcutta was marked more towards the east than Chandernagor, while in fact it was more to the west. Boudier and Pons found it surprising that the pilots sailing on the Ganges from one town to the next had not corrected this error. In addition, the report contains observations of the meridional heights of stars in 1734 taken from several towns [*Lettres* 1810, 15: 280-83].

At Kassimbazar, the French Jesuits carried out observations to calculate longitudes in 1734. These observations related to the immersion of the first satellite of Jupiter on January 30 at 15 hours, 41, On the same day, the passage of Beta Polaris was noted at 14 hours, 2 minutes and a fraction of a second [*Lettres* 1810, 15: 284-85]. At that moment a second star passed the vertical of the North Star at 16 hours 21 minutes and 30 seconds. From the passage of these two stars across the vertical of the North Star the time of the immersion of the satellite was obtained. During this period the time elapsed was 2 minutes and 50 seconds, and the hour of immersion was corrected to 15 hours 38 minutes and 30 seconds. At Fatehpour the immersion of the first satellite on April 2 commenced at 13 hours 45 minutes and a fraction of a second. On the same day, the height of the tail of Leo towards the west was 46 degrees 9 minutes at 13 hours 50 minutes and a fraction of a second, and the height of the brightest star in Aquila towards the east, was 19 degrees 1 minute 30 seconds at 13 hours 57 minutes and about 10 seconds [*Lettres* 1810, 15: 285]. From the height of the two stars it was concluded that the time elapsed was 1 minute 26 seconds, the corrected hour of immersion was 13 hours 43 minutes and 34 seconds. Based on Pere Gaubil's observation of the time of immersion in Beijing on the April 11, 1734 [*Lettres* 1810, 15: 285], the difference between the meridian at Paris and Fatehpur was calculated at 5 hours and 13 minutes. This could be calculated differently. At a known time the interval between the immersion on April 2 and 11, was 8 degrees 20 hours and 25 minutes, that could be subtracted from the time of observation at Beijing On April 2, 16 hours 6 minutes and 57 seconds was the time of immersion at Beijing. But at Fatehpur it was observed at 13 hours 43 minutes 34 seconds. This gives a difference of 2 hours 23 minutes and 23 seconds, that must be subtracted from the longitude of Beijing, which was 7 hours 36 minutes. The difference between the meridians at Paris and Fatehpur was 5 hours 12 minutes 37 seconds or 5 hours 13 minutes [*Lettres* 1810, 15: 286] A similar exercise was carried out in the case of Agra [*Lettres* 1810, 15: 287]. Gaubil responded to the longitude measurements based on the observations of the occultation of the Jovian satellites, pointing out the error's in Boudier's calculations and that Boudier was unaware of stellar aberration [Gaubil, cited in Sharma, 1982: 347].

However, in the case of Delhi a solar eclipse that occurred on May 3, 1734 was used to obtain the longitude. The eclipse commenced at 3 hours 57 minutes and 1 seconds, but it was difficult to decide the

end of the eclipse since the sky was cloudy. The corrected time for the eclipse was 3 hours 59 minutes and 59 seconds and finished at 5 hours 58 minutes and 3 seconds [*Lettres* 1810, 15: 268]. In a letter Pere Gaubil had mentioned that the Swedish astronomer Celsius had observed the end of this eclipse at Rome at 11 hours 52 minutes and 1 second. Using the method developed by La Hire, the eclipse commenced at Delhi, when the time in Rome was 11 hours 40 minutes and 5 seconds in the morning, and finished at 1 hour 39 minutes 40 seconds in the afternoon. This gives the difference between the meridians at Rome and Delhi as 4 hours 19 minutes and 4 seconds for the commencement of the eclipse and 4 hours 18 minutes and 18 seconds for the end of the eclipse. These differ by 46 seconds, half of which is 23 seconds. Adding this to the smaller of the two figures, we get the mean difference of 4 hours 18 minutes and 41 seconds, to which we add the difference between the meridians of Rome and Paris, which is 41 minutes and 20 seconds. Thus the difference between the meridians of Paris and Delhi is 5 hours and 1 second [*Lettres* 1810, 15: 288].

On December 1, 1732 there was a total immersion of the moon at 22 'gharis' (the Indian unit ghari= 24 minutes, and each ghari=60 'palas') 7 'pols' after sun set was observed at Jaipur. The emersion commenced at 26 gharis 13 pols and a half after sun set. Thus the middle of the eclipse was at 9 hours 41 minutes 24 seconds after the sun set. In their calculation the brahmins had not taken account of the effects of refraction, and the fact that the sun set at 5 hours 12 minutes 48 seconds, consequently the middle of the eclipse was at 14 hours 54 minutes 12 seconds [*Lettres* 1810, 15: 289]. According to Cassini's observation at the Paris Observatory, the middle of the eclipse was 9 hours 58 minutes 38 seconds. Hence, the difference between the meridians of Paris and Jaipur was 4 hours 55 minutes 34 seconds [*Lettres* 1810, 15: 290]. While Gaubil had made his observations of the satellite of Jupiter using a 20-foot focal length telescope, the Jesuits during their expedition used one that was a refracting telescope of focal length 17-feet [*Lettres* 1810, 15: 290].

Perusing these records, we recognise firstly the importance and authority of Gaubil among the Jesuit astronomers in India, for he appeared to be providing them the numbers that they considered standard, and thus aided their calibration. It was Gaubil who forwarded their results to Cassini, and thus the latter was the final authority certifying the results of the expedition. Secondly, the study of the motion of the stars and the planets, enabled the savants, through the Jesuits to map the co-ordinates of the globe, symbolically weaving Paris, Rome, Delhi, Jaipur and Beijing into the new fabric of modern science of which the Jesuits were the prominent cultural vectors, and subsequently the agents of cultural imperialism.

The Duchamp manuscripts

In order to reassert the point regarding Gaubil as an authoritative figure within the realm of Jesuit science we must briefly discuss two other Jesuit scientists in India, Pere Patouillet and Pere Xavier Duchamp. Two of three important sources for the history of astronomy in India appearing in Jean-Sylvain Bailly's *Traite de l'astronomie indienne at Orientale* [Bailly 1787] and Delambre's history of astronomy [Delambre 1817 and 1819], were based on Jesuit reports of Sanskrit manuscripts. One of them was sent by Pere Patouillet from India to the astronomer Joseph de Lisle in 1750. This was a copy of the *Pancanga Siromani*. The manuscript may have come from Masoulipatnam or Narsapur, but Bailly felt that it came from Benaras that has the same meridian as Narasimhapur, whose provenance was questionable [Sen 1985: 50]. The manuscript of Duchamp, or the Xavier manuscript as Sen refers to it, could be a copy of a treatise on Hindu astronomy authored by Duchamp, that he had mailed to Gaubil then in Beijing [Sharma 1982: 348]. Copies of some of Duchamp's manuscripts are extant at the archives francaises de la Compagnie de Jesus at Vanves, Paris [Duchamp]. Most of these are not Sanskrit manuscripts, but accounts of Indian astronomical practices, calculations of eclipses based on the explication of the procedure followed by Tamil astronomers at Pondicherry, and contain a glossary of astronomical terms employed in Sanskrit and Tamil. Both Patouillet's manuscript and the Duchamp manuscript were the focus of much discussion with the astronomers Bailly, Laplace and Delambre. Pere Duchamp's manuscript suggests that within the Indian astronomical tradition there existed many methods for calculating the equations of the sun, moon and the planets. At the time, the manuscript was prepared, Pere Duchamp had not deciphered the steps in the operation employed to calculate the time for the commencement and the duration of eclipses. The procedures he documents have to do with those operations that were employed to calculate past eclipses. To validate his reconstruction of the computations of the brahmins, Duchamp requested the help of a brahmin astronomer, and used his method as an exemplar in order to illustrate the procedure employed [Duchamp: folio 000002]. It is during this ethnographic phase of French Indology, that the *Surya Siddhanta* begins to be canonised as the Indian *Almagest*. It is very likely that Duchamp was unable to decipher the Siddhantic rules for calculating eclipses. The method he encountered was probably the 'vaikiam'. Since Duchamp was unable to discover the textual source of the method he concluded that the method itself was forgotten amongst the practitioners of Indian astronomy and astrology. This textual dissonance is reflected in his explanation that is articulated from his location both in terms of cultural superiority, as well as the Jesuit construction of the brahmins as adversarial authorities. The brahmins would not have shared their knowledge of their method or divulged its source for they would have lost a livelihood had they done so. Secondly, Duchamp felt that they would have lost a sense of correctness of their science. This criticism drew upon the quintessentially renaissance premise regarding the virtues of the democratisation of knowledge.

The letters of the Jesuits [*Lettres* 1810] are not only important from the point of view of literature, but provide us of the first accounts of a country derived from a textual knowledge of Sanskrit. It was Nobili who had created an interpretive tradition that privileged the written text as being the voice of a civilisation [Zupanov: 126]. A number of Sanskrit texts were sent to the Bibliotheque royale in Paris; but these were largely texts of scriptural value. In this fascination with textually inscribed knowledge, Duchamp saw the brahmins as the only literate interlocutors in India, who no longer appreciated their rich textual legacy; and hence even they were in a sense illiterate.[12] The positioning of such interpretations within the discourse of India gave credence to the idea of the wisdom of an ancient people which had been disfigured. The theory of the lost ancient peoples was to serve, within appropriate contexts, as a device for maintaining their constructions of non-western peoples, that could in turn legitimate imperial control and programmes.

As far as astronomy proper was concerned the Indians had forgotten the theoretical context of their astronomy (read textual) and knew only how to calculate, and even these calculations of meridians, by now a Jesuit specialty, and eclipses were not accurate [Duchamp]. Consequently, Duchamp indicates that the native

astronomers had predicted that the eclipse of July 29, 1730 would be partial and the disk would be of the order of 3/4, when it was actually 4/12. Furthermore, given the Jesuit interest in chronology, Duchamp was unable to find the formula to convert the Indian calendars to the western one. Nevertheless, he specifies that the sources from Thailand would provide important material and throw some light on the equation of the centre [Duchamp: folio 000154]. However, in a letter to Souciet dated January 3, 1733, Duchamp retracted some of his remarks concerning the correctness of some of the Indian astronomical procedures, especially those related to the calculation of latitudes [Duchamp 1733].

Pere Calmette collaborated with the Carnatic mission for 15 years and studied the sciences and monuments of India, and discovered the similarity between the Indian and European zodiac, which in turn reminded him of Greece [Bamboat 1933:98].

However, we should note that when it came to the astronomical sciences, the Jesuits based their reconstruction on the recounting of astronomical practices, the era of textual reconstruction was a century away. In this, the contrast with China is substantial. Furthermore, the Jesuit scientists of the late 17th and early 18th centuries were inaugurators of a discourse on India and Indian historical astronomy marked by ambiguity, where fascination and dismissal go together; where the enchantment with the new world and its distinct knowledge forms provide the occasion for enriching the self in cognitive and cultural terms, and through a simultaneous act of distantiation, of redefining the self as superior. The terms of this engagement were defined by the contemporaneous preoccupations of late 17th and early 18th century Europe and France in this case. Despite the overwhelming dimensions of this intellectual landscape that provided Jesuit science with its crucial identity, Indian voices gradually imposed what Zupanov calls "their own horizon of interpretation" [Zupanov 1993:143]. But it is this new self-assurance in the idea and culture of Europe that possibly prompted Bamboat's remarks that the 17th century voyagers couldn't appreciate the beauty and depth of the literature and sciences of India [Bamboat 1933:146].

Cognitive and Cultural Horizon of the *Lettres*

The *Lettres* were first published in 1704 and its audience was the church of France, clerics and devotees [Murr 1983: 238]. The collection of letters sought to inform this devout readership of the work of the foreign missions and the difficulties that afflicted them. It also served three other strategies on the political, economic and apologist planes. In political terms, the *Lettres* constantly provided evidence of missionary activity in the service of the glory of the king of France [Murr:238]. The economic strategy was designed to attract resources for missionary activity abroad. Thus the *Lettres* served as publicity material to attract funds for the Society [Murr: 239]. As apology, the *Lettres* served as an instrument of religious propaganda, to point out to Catholic devotees that god was always amongst them and constantly intervened to assist those who served with religious zeal. But a more significant task was to combat libertines, atheists, skeptics and the attacks mounted by the philosophes. The letter of Pere Bouchet to M Huet, former Bishop of Avranches is an exemplar of this genre of philosophical and religious combat [*Lettres* 1810, Tome 12: 136-93]. Here, the author very subtly sets up a distance between Catholic doctrine and the views of the Pythagoreans and their Indian counterparts. The scientific agenda of the Jesuits never prevailed upon the strategic intentions. If in the course of their explorations they came across an Indian work that provided a more accurate, authentic account, Murr argues, they would certainly not have communicated it to Europe unless they felt that the cause of their religion would gain something; for the underlying belief was that the civil customs and religious beliefs of the Indians were undesirable for Christians in France. Thus Murr goes on to write that scientific finality was subordinated to pastoral finality [Murr 1983: 240]. Letters mailed from India by the Jesuits that travestied this official image of the country were either unscrupulously torn, edited, censored or modified by the editors of the *Lettres* [Murr 1983: 240]. Furthermore, as far as the transmission of scientific knowledge was concerned, we see no mention of Copernicus, Kepler or Galileo in their letters. In fact, during their expedition to Jaipur, it is not clear whether Peres Boudier and Pons even appraised Jai Singh of the Copernican system.[13]

There was a change in publication practices of Jesuit astronomers in India and China at the turn of the 17th and early years of the 18th century. The astronomical observations made by the Jesuits were regularly mailed back to Paris by the Jesuit-mathematicians of the king till the end of the 17th century. With the commencement of the 18th century the Jesuits preferred their own works on astronomy, or published their observations from their foreign missions in journals such as *Journal de Trevoux* [Murr: 243], that was established in 1701 and continued publication till 1767. Amongst a range of doctrinal debates and polemics the journal served as a forum for the publication of the scientific researches of the Jesuits. This possibly explains Heilbron's observation that after 1700 Jesuit scientists authored about 600 articles in scientific journals [Heilbron 1989: 41]. It is only in the second half of the 18th century after the Society of Jesus was suppressed, and the *Lettres* were terminated, that the Academie des Sciences became interested in anthropological terms in producing a positive discourse on India, devoid of partisan influences [Murr 1983: 243].

The information on India and the image of India appearing in the *Lettres*, Murr suggests, are enveloped in a rhetoric where the relations of alterity between the French and the brahmins simultaneously develop along three levels. The first is a radical alterity, where India is presented as an elsewhere [Murr 1986: 15]. Throughout the first half of the 18th century, the Jesuits reaffirmed that paganism was a form of madness and the unhappy Indians were prey to the delirium of a mythology as monstrous as that of the Greeks and Romans. Thus the translation of beliefs, superstitions and ritual practices were constantly aimed at presenting elsewhere as an elsewhere that was radical and close to an inverted image of here. It was an ideological and fantasmatic elsewhere signifying that the church was the fount of enlightenment, truth and reason [Murr 1986: 15-16]. The second is *similitude*: India is presented as an other here. At the same time, as the Indians were presented as anti-Christians, they were considered as similar to the Europeans. Like the philosophes, the Jesuits affirmed that human nature was identical and that exotic particularities were inessential. But this founding idea of human nature was not based on some rational anthropology, but was theological since rationality was constantly subject to the dictates of dogma [Murr 1986: 17]. The third sense was an *exemplar*: India is presented as a Utopia. There were to two types of Utopia, the first was Christian and the second 'system de police ideal' – the social order [Murr 1986: 19]. In the case of the Christian Utopia, the original purity of the missionaries conferred on them a legitimacy that *sui generis* they believed endowed authority on the first apostles and apologists in the apostolic work and from whom they adopted a model of autonomy in judgment *vis-a-vis* the Vatican. In the second type

of utopia, the social order of the Indians was presented in certain letters as an ideal model, where all social life was subordinated to the sacred order, the clergy was the fount of temporal power and that all social order was scrupulously observed and social pressure conserved values. This was the dream system of the Jesuits where natural life was mediated by social life, subsumed in turn by the reality of the sacred order [Murr 1986: 21-22].

Interpreting Bible and Mapping Earth

Amongst the French Jesuits who came to India were a number of Jesuit astronomers. While their task in India was primarily related to conversions, these Jesuit scientists played the important role of surveyors of this new domain. Even within their role as evangelists, they were predisposed to *accomodatio* as a missionary strategy, that had been perfected by Nobili and embraced by the Jesuits of the Madurai, Carnatic and Mysore missions. Furthermore, Nobili's strategy included adopting local cultural practices, and more importantly consisted in recognising the brahmins as the savants on the Indian subcontinent. The brahmins were thus projected simultaneously as adversaries, whose cultural practices were to be emulated in India by the Jesuits in order to further the cause of the French king and more importantly, the church. On the other hand, the brahmins were also considered the repositories of the cultural and intellectual treasures of India, and it was through them that Europe would be enlightened about this ancient land.

Hence, in the letters these Jesuits wrote home, we find a panel of images of India, most of which persisted throughout the French enlightenment, as well provided the founding tropes of Orientalism. However, these letters were also the source of much scientific information on the geography, botanical resources and medical practices of India – material for the historian of science. This material has not been meticulously investigated by historians of science, for reasons that partially have to do with self-imposed obstacles within the historiography of sciences. The scientific investigations of the Jesuits have for long been neglected. In addition, to the material appearing in the *Lettres* the Jesuits published their scientific findings in reports, in particular of astronomical observations, and scientific journals in the early decades of the 18th century.

While the era of textual studies on the history of astronomy of India did not commence till the birth of British Orientalism, the Jesuits provided an ethnographic account of the prevalent astronomical practices, and these accounts later went on to shape the subsequent reconstruction of Le Gentil, Jean-Sylvain Bailly and Laplace. Within the overarching frame of the *'discours sur l'Inde'*, the Jesuits simultaneously contributed to promoting an interest in the subject amongst practising astronomers from the age of the enlightenment. Beyond the fascination with this ancient knowledge, the Jesuit accounts were punctuated with markings of caution, that this ancient knowledge could not possibly have been generated amongst these fallen people, who had possibly disfigured a wisdom that had arrived from elsewhere. By the 1830s or thereabouts the idea that other civilisations could have had a 'science' as conceived by the Enlightenment came to be regarded with increasing scepticism. While India and Iran were possibly exceptions, the Orientalists had framed them as part of the Indo-European family. As Bernal succinctly puts it they filled the "niche of exotic ancestors" [Bernal 1987:236].

Jesuit interest in Indian astronomy had to do in turn with two raging Biblical themes: that of the commencement of the world and that of dating the deluge. Astronomy and the scientific interpretation of passages of the Bible would provide the hermeneutic to decode the precise history of these events. The skies, as in eras past offered the key to scriptural enlightenment. Jesuit interest in the astronomy and chronology of the Chinese and Indians was prompted by the need to explicate these events, in case other traditions had an answer to these quandaries or provided evidence tha[t] would validate the claims of the Europea[n] astronomers. The antiquity of India[n] civilisation provided the pretext fo[r] clarifying burning questions o[n] chronology. The debate was organise[d] around history, and the coherence of th[e] Judeo-Christian world founded on th[e] sacred chronology of the scriptures [Mur[r] 1983: 249]. Indian chronology, a[s] evidenced in the astronomical sources would provide the final validation that th[e] Indians could not have predated the delug[e] that was supposed to have transpired 3,50[0] years ago. Pere Bouchet and Pere Calmette cited earlier, in 1767 sent a chapter to th[e] Academie des Inscriptions et Belles Lettre[s] on *'Sciences de Brahmes, epoque d[u] Deluge'* [Murr 1983: 253]. Thi[s] preoccupation persisted in to the age o[f] the enlightenment. Dating the delug[e] served three ends. Firstly, it provided [a] secular, scientifically validated accoun[t] of certain primal episodes recounted i[n] the Bible. Secondly, it possibly certifie[d] that Judeo-Christian civilisation predate[d] its Indian counterpart. Finally, there wa[s] both the scientific and religious issue t[o] be settled, as to when the universe wa[s] created – a key anxiety for scientists an[d] Christians since the time of Newton[.] Newton during the later years of his lif[e] was ensconced in the world of alchemy[,] astrology and magic. But these wer[e] rather discredited predilections withi[n] a century of his death. This possibl[y] had to do with the triumph of capitalis[m] in England and Holland and statism i[n] France [Bernal 1987:169]. We are how[-]ever still located within the Jesui[t] world where these scriptural concern[s] were significant to the scientific prac[-]tices of the Jesuits – and this should no[t]

Appendix 1: Table of Latitude of the Following Places, and Their Longitude with Respect to the Royal Observatory of Paris

Name of town	Longitud	East	Latitude	North
Jaipur	73m	50'	26m	56'
Digh	75	22	27	25
Mathura	75	49	27	30
Agra	76	9	27	10
Delhi (Raja's observatory at the Mughal emperor's palace)	74	54'	28	37
Faridabad	75	8	28	41
Etawah	76	57	26	45
Fatehpur	78	30	25	56
Benaras	80	47	25	21
Jehanabad	81	40	25	10
Patna (with the Reverends of the Pères Capucins*)	83	15	25	38
Murshidabad	86	41	24	11
Chandernagor (the Church of the fortress)	86	5	22	51
Calcutta	86	2	22	33'
Balasore (the observation of the Jesuit Père Martin)	84	36	21	29

* Another Christian order from France.

Taken from the report of 1734 appearing as Observations in *Lettres*, 1810, Tome. 15, pp 271-273

surprise us. For in this 'deeply religious age', the book of nature was as much a source of the natural philosopher's knowledge as divine knowledge was of Scripture [Shapin 1996: 137]. While an independent existence was sought for natural philosophy, science could extend support to religious beliefs [Shapin 1996: 137].

The other dimension of the interest in the antiquity of Indian civilisation was to establish a certain direction of cultural diffusion. This direction would be essential to founding Europocentrism, and the idea that Greece was the epitome of European scientific culture. The historical device, that we encounter within the archive of Jesuit science, and that is frequently reiterated in the Enlightenment writing of historians of astronomy, is to draw upon various cultural analogies between the Occident and the Orient, and explain these analogies in terms of a cultural transmission from the west to the east [Murr 1983: 253].

This trend ran parallel with the suggestion of the Academie in 1744 to compose the history of India for itself. Outside the Jesuit circle, then the Academy sought to install Orientalism as contrary to Europocentrism. This complement to universal history, combined the hermeneutic method with comparative etymology to prove that Bacchus was none other than Osiris, who was none other than Esau, who was none other than Iswara in the Indian tradition. But this too was a superfluous alteration of the cosmogony of Moses [Murr 1983: 250]. It is not our purpose here to discuss the 18th century French Orientalists, but to highlight the key themes elaborated by the French Jesuits that shaped the subsequent historical discourse on the astronomy of India, occasioned by French astronomers of the Enlightenment decades. By the time the Jesuit order was suppressed in the third quarter of the 18th century, astronomy had moved into the hands of secular astronomers who embarked on expeditions overseas, to either India, China, South America. The perseverance of the Jesuits though never acknowledged, would echo in the Laplacian synthesis of celestial mechanics. And even though the images of India communicated by Jesuits would endure in the history of science, the labours of the British Orientalists would alter the terms of the discipline, such that Orientalism itself would become a discourse constitutive of the history of science in the 19th century.

Appendix 2: Glossary of Astronomical Terms in the Text

Celestial meridian: a great circle on the celestial sphere, passing through the two celestial poles on the observer's zenith.

Ecliptic: the apparent annual path of the sun among the stars; the intersection of the plane of the earth's orbit with the celestial sphere.

Emersion: the appearance of a celestial body after and eclipse or occultation.

Immersion: the disappearance of a celestial body either by passing behind another or passing into another's shadow.

Meridian altitude: the altitude of a celestial body when it is on the celestial meridian of the observer, bearing 000° or 180°.

Meridian passage: the passage of a celestial body across the observer's meridian.

Meridional: pertaining to longitudinal movements or directions that is northerly or southerly.

Meridional difference: the difference between the meridional parts of any two given parallel latitudes; this difference is found by subtraction if the two parallels are on the same side of the equator, and by addition if on opposite sides.

Metonic cycle: a time period of 235 lunar months, or 19 years 11 days; after this period the phases of the moon occur on the same days of the month.

Obliquity of the ecliptic: the acute angle between the plane of the ecliptic ande the place of the celestial equator, about 23°27'.

Sidereal month: the time period of one revolution of the moon about the earth relative to the stars, this period varies because of perturbations, but is less than 27 1/3 days.

Sidereal year: the time period relative to the stars of one revolution of the earth around the sun; it is about 365.2564 mean days

Synodic month: a month based on the moon's phases

Notes

[This paper is the preliminary portion of a larger study on India in the landscape of Enlightenment historiography of sciences. I take this opportunity to thank Jean-Marie Lafont of the Centre de Sciences Humaines, for introducing me to the Jesuit archive at Vanves, and helping me out with 18th century French, where the French-English dictionaries failed me, Catherine Jami of REHSEIS (CNRS), Paris, for her heip with the Duchamp manuscript, and her own insights on the science of the Jesuits; S Irfan Habib of NISTADS, New Delhi, for his ready discussion, Jacques Pouchepadass from EHEIAS, Paris, for acquainting me with the *Lettres Edifiantes* and the work of Sylvia Murr.]

1 An important work from the end of the 17th century published by the L'Imprimerie Royal in 1692 is *the Observations Physiques et Mathematiques pour servir a l'Histoire Naturelle Envoyees des Indes et de la Chine a l'Academie des Sciences a Paris.*

2 Joseph Needham has chronicled the contributions of the Jesuits in China to the emergence of French science [Needham 1959].

3 Historical astronomy is a term employed by Han, that we shall attempt to elaborate later in the essay.

4 One of the first astronomical texts produced in French based on a collection of Sanskrit astronomical manuscripts is that of Abbe Guerin that appeared in 1847, and he mention that he was aided in his efforts by member of the Asiatic Society, Calcutta.

5 For example, the arrival of the French "King' Mathematicians" in China precipitated an acut conflict between the French Jesuits and th already resident Portuguese Jesuits. Jami write "what in Europe was an attempt to brea Portugal's monopoly of the sponsorship o Asian missions on the one hand, and a conflic of power between Paris and the Vatican for th control of church institutions on the other, wa reflected in China by a split between Frencl and Portuguese...Jesuits" [Jami 1995:496].

6 For a study of the image of India in th accounts of the Portuguese Jesuits se [Bouchon 1988].

7 A 19th century account of the French mission in India is to be found in the well know [Launay 1898], and draws upon the archive of a number of missions.

8 A 19th century account of the French mission in India is to be found in the well know [Launay 1898], and draws upon the archive of a number of missions.

9 See the letter written by Pere Papin to Pe le Gobien, also of the Society of Jesus, fro 'Bengale' on the December 18, 1709 [*Lettre*. Tome 11: 202-209]. The letter is a descriptio of the textile and mechanical arts of Beng as well as contains a description of medic practices. This is followed by a second lette dated 1711 and sent from Chandernagor detailing the medical practices encounter in Bengal [*Lettres*, Tome 11, 209-215]. Th interesting feature about the letter is th comparative perspective adopted in narratin these practices

10 The paper by Forbes chronicles the era of th Portuguese Jesuit astronomers in India durin the 16th and 17th centuries.

11 Much later D'Anville recalculated the longi tude of Delhi with respect to the meridia of Ferro as 94° 54', while Boudier's valu was 74° 54' with respect to Paris. Similarl for Chandernagore D'Anville give Boudier's value with respect to Paris as 86 5' [Sen 1982: 7].

12 Much later, with the rise of British Orientalism Sanskrit was considered in an analogou relationship to the Indian vernaculars as Gree and Latin were to the European ones. Thus the focused their explorations on ancient Sanskr literary, philosophical and scientific work and their privileged interlocutors were the 'subcontinental counterparts', the brahmin who mastered Sanskrit [Raj 1996, 288].

13 Sharma mentions a letter from the Portugues Jesuit Figuerado that discusses Copernicu This letter appears in the 1781 edition of th *Lettres*, but is not found in the 1810 editio [Sharma 1982: 352]. This is interesting fo one of the leading Jesuit scientists of the 18t century Ruggiero Giuseppe Boscovich (1711 1787) played a significant role in revising th eclesiastical hostility to Copernicus astronomy.

The Great Indian Novel

Reflections on the Lentin Report

Shiv Visvanathan

More than the novel or the pamphlet, it is the bureaucratic document, as expert's report or as a commission of enquiry, that has captured many of the great dramas of the 20th century. It is these reports that will survive as the archives of democracy in India. The Lentin Report on the deaths due to contaminated glycerine at the state run J J Hospital in Mumbai is such a document, a contender for the Great Indian Novel. The report examines four institutions, the hospital, the industry, the Food and Drug Administration and the politician, in painstaking detail showing how individual acts of corruption, each insulated in itself, together led to the tragedy. And, typically, its findings lie unattended till today.

I

THE facts are simple. Bhaktavar Lentin, a judge of the Bombay High Court, was appointed to head a Commission to investigate the death of 14 patients in January 1986 at the J J Hospital, Bombay. But facts as journalese are not enough. *The Lentin Report*[1] demands a deeper meditation. We have to understand why a monograph replete with technical details on everything from chemistry to promotions has become a contender for the Great Indian Novel. To understand this we have to begin by viewing the bureaucratic report as a literary form.

II

Literary genres like poor relatives can be subject to benign neglect. While the bureaucratic report is one of the great literary forms of the 20th century, it has not received its due from critics. Great critics from Lukacs and Bakhtin to Watt and Rene Girard have celebrated the novel, waxing eloquent about its varieties of time, its multiplicity of voices.[2] In a fundamental way the novel is a tribute to that great historical archetype – the bourgeois and his favourite site, the city.

The clerk as archetype has had his Kafka and his Balzac but the bureaucratic report has yet to find a critical genius, an equivalent of a George Steiner or a Hannah Arendt. This is crucial for more than the novel, or the pamphlet it is the bureaucratic document, as expert's report or as a Commission of Enquiry that has captured many of the great dramas of the 20th century. Whether it is the future as heuristic, the process of planning, the genocides of development, the multiculturalism called the UN, it is the report that has been iconic of these events.

The Bureaucratic Report performs a second and more parochial function in the Indian context. One genre of writing that India has virtually missed out on is the detective novel. The writings of Conan Doyle, Poe, and Georges Simenon are meditations on murder, crime, scandal. They see murder and crime as processes of disordering which the detective restores through the investigative act. For the detective, the equation is clear, Truth = Justice + Rationality. The detective novel operates at the level of the individual world. One looks for a motive, and a weapon. The structure of causation is direct. The plot is generally a series of dyadic encounters. The detective reserves the right to interrogate the various characters and through the interrogation he recreates the rationality of the modern world. The closest one gets to such a situation in India is in the encounters with the lawyer, the policeman and the doctor, the trio of professionals who thrive through interrogation. The nearest approximations to the detective story come through narratives around these three characters. Initially one was puzzled as to why detective fiction as a genre didn't thrive in India. But when one thought it through, one realised that the detective story exists in a transformed way as the Commission's report.

The Commission's Report is both a detective story and a sociologist's investigation. It interrogates both the individual and the system. Secondly, there is a quality of everydayness that the report has, a mundaneity which even the best of Simenon lacks. Crime in one is individual and even individualistic Corruption in the other focuses on the individual but also creates a chain of being. The report suggests that even evil is a collaborative act which participates in the division of labour.

The Report explores a second kind of murder, a crime, a scandal which implicates not one man but a network of people. Some may not even know each other but all are implicated in the crime. True, the act of death may have a presiding genius but he is only first among equals. What one has to confront is a network of acts, events, emotions, indifference, error, mistakes, cheating, incompetence, imposture and all woven together. Each might actually be an isolated act and eventually what connects them is only the narrative. It is the story that implicates all.

There is an imperiousness to these narratives but it is not the imperiousness of kings or of the cartesian detective. It is the imperiousness of democracy asking for an account, an accounting and an accountability. Number and narrative, numeracy and literacy weave together in these reports. This eponymy of the report is also crucial as importance of the eponymy of scientific discoveries. The labels, the *Kothari* Report, the *Lentin* Report, the *Shah* Commission give it a resonance, a stability, an equilibrium like Chandrasekhar's Limit or the Raman Effect. Like science textbooks there is a realism to these reports, an objectivity and as expert's documents they operate value neutrally. Yet the passion and rage that seeps through them is awesome. Where many of these documents fail is in their sense of ending, the act of closure. They elaborate the spectacle of crime and evil, the theatres of corruption and yet their prescriptions are done with callipers. It is as if the Commissions begin like clerks and experts, metamorphose into diagnosticians of the *polis* and return eventually to the boundedness and neutrality of expertise. The final move is an act of redistancing, a disengagement from the world they have been guiding us through.

Any report appears to have three aspects (1) the factual (2) the normative (3) the pedagogic. There is first the sense of realism, who did what, to whom, when and how? The who-done-it. Then a sense of order or the violation of it. Who broke the rules? Which one and how? Finally there is an act of persuasion, that the normative order still deserves support, still

deserves repair. In that sense every report is a morality play.

The Commissions of Enquiry have thus been pedagogic exercises involved in rituals of restoration. They seek as it were to restore the *nomos* and what makes them really powerful is the rhetoric of normativeness they use so unconsciously. They are obsessive about procedures but it is norms that they are really concerned about. More than the works of journalism or the political theory of academics, it is these reports that will survive as the archives of democracy in India.

These reports presuppose a reader but the overt hospitality, the seductive invitingness of the detective story is missing. They make no concessions to the reader. In fact they surround themselves with a thicket of technicalities, as an initiation rite for those who want to enter this world. But once one moves beyond this, these reports become a celebration of a civics, a *polis*, a moral world. In that sense they are stories that every child should read and every adult remember. From Santham to Chagla, from Shah to Lentin what we have are grand moralists in a world before postmodernism was born. In fact it is the world of crime and corruption that seems postmodern, polyvocal, inventive, chameleonic and to counter them one returns to an old fashioned rhetoric, and old vanguard celebrating their world, its values, their careers and especially their icons with love and integrity. They also seems to say 'We write, let the readers learn to read'. How does one read these texts?

Keith Tester in *The Inhuman Condition* provides a way open even to a general reader. He borrows Richard Rorty's contrast between inspired and methodical reading. He states:

> The methodical reader attempts to discover the definitive and absolute truth of a text (an attempt which is doomed to failure, every reader will discover his or her own truth). The methodical reader tends to place the text under a glass dome in a museum. But, by contrast, the inspired reader approaches the text as something which might change his or her life. An inspired reading identifies a text as a stimulus to creative thought and even action.[3]

In that sense *The Lentin Report* is a book you must read with your children, at least the older ones. Lentin's encounter with each character comes out as clearly as a photograph. Yet there is more. This is not a series of snapshots in an album of homicide. It demands that you talk to the book, engage with it. It is only the social act of hermeneutic, of reading and rereading and remembering that can redeem the senseless death of fourteen innocent patients.

III
Death in the Hospital

Commission Reports like constitutions usually have preambles. The preamble to the constitution enacts a covenant. It is the creation myth of a political society. But a Commission's Report unlike constitutions do not begin with creation myths. They begin with the moment of the fall, the scandal, the tragedy, the disaster as death, flood, riot, or accident. This serves as the trigger for the Commission which reconstructs these events and restores them to the norms. The Commission's story is the act of healing, a narrative needle stitching up the ruptures step by step. The introduction states

> In January 1986, tragedy struck the J J Hospital. Four departments were affected, Neurology, Neurosurgery, Nephrology and Ophthalmology.... It started with Bapu Thombre. He died on 21st January 1986. He was followed by 13 others. The last was Dawood Dholakia on February 7, 1986. They were all patients in the J J Hospital. They all died unnatural and untimely deaths. The ages ranged from 10 to 76. Two of them were well on their way to recovery. To the astonishment of the doctors, they too died. The common drug administered to all 14 was glycerine, otherwise a harmless drug in therapeutical doses used down the years by the medical profession the world over including the J J Hospital to combat oedema or swelling of the brain.
>
> But this glycerine was not harmless. It was lethal. It was contaminated with diethylene glycol, a deadly poison. As a result, all these patients developed aneuria leading to renal cortical necrosis. It was irreversible. Dialysis was of no avail. They did not ask to be born; they did not choose to die. They died. They died as they had lived, quietly and in poverty.
>
> Little could they know that by their deaths they would arouse an outcry of public indignation which would lay bare lack of probity in public life, malaise and corruption in places high and low indulged in contempt of the laws of God and man. All is over bar the shouting. It is time to pause and forage into the murky waters of lies, deceit, intrigue, ineptitude and corruption to salvage the truth which led to this ghastly and tragical episode.
>
> To that end, insofar as is relevant to this Inquiry, hereunder the set up of the J J Hospital and the sequence of events (p 1).

Justice Lentin's investigation unravels this event through a series of nested frames. First the chemical. Then the medical. Then the organisational. The last is a bit like the map in a detective novel; a prop, necessary in a symbolic sense but not for use. A vestige, a reminder of bigger wider explorations.

Glycerine is a standard drug recognised as such in the Indian pharmacopoeia. For years it has been used to relieve cranial pressure. The drug requires high standards of purity. It must be at least 98 per cent glycerine and not more than 2 per cent moisture.

The drug administered at J J Hospital was not glycerine but diethylene glycol which is drastic on the liver and lethal on the kidneys. Even dialysis is unable to reverse the effects. The doctors who administered the drug did so in good faith. The possibilities of renal failure were distant and the two reported cases (one in 1937 in the US and the other in 1969 in South Africa) were few and far between. In fact the doctors were not even aware of them. What was administered as a standard drug in all innocence resulted in 14 deaths. Yet, innocence, as Lentin discovers is a strange word. It is the white that hides enormous shades of grey. It is prim and official, to be worn like a mask to hide the secrets of the soul and it is with this perspective that Lentin studies the hospital.

Before we proceed we must emphasise something. Weaving through the tropicality of corruption that constitutes the core of the report, one forgets the victims. Here the victims are mere bodies. They died but there is no meditation on death. The report, like the detective novel, seeks to elude death by unravelling a homicide.

Lentin's foray into J J Hospital becomes an epitaph for a generation. J J Hospital could be urban India in its potential, its arbitrariness, its dankness, its cramped rooms, its seedy storage places, a factory demanding herculean hours from nurses who had to climb three to four floors half-a-dozen times during a shift because there were no lifts. It was still a great hospital but like most Indian institutions on the decline.

A hospital is a system of care and communication, and so the first question Lentin asks is: what happened when the doctors discovered they had administered a contaminated drug? The answer was disturbing. As Lentin notes, it "makes for startling reading" and he adds, "difficult though it may be... I shall endeavour to speak in measured terms and restrained vocabulary in deference to their noble profession".

The Dean, Dr Chandrikapure, admitted that he did nothing when he received a

phonecall from the department of nephrology informing him that they suspected the administration of a contaminated drug to be the cause of the deaths, he admitted he did nothing. "It was his day off, so he did nothing (p 33). Despite the seriousness of the situation, the Dean did not visit the hospital on the lame excuse that there were competent people in the hospital to handle the situation. He did not even telephone the Head of Departments or any doctors to narrow down the suspect drug". For two vital days, "while the drug was still being administered the Dean enjoyed his holiday and did nothing. Rome burnt and Nero fiddled"

The story of the hospital superintendent is equally startling, even more bizarre. As Lentin remarked "His course of conduct like the Dean's borders on the grotesque" Like the Dean, Dr Deshmukh lived on campus but when informed of the deaths he stayed at home stating "that every death that takes place is no signal for him to rush to the hospital" and that "there was nothing he could have done about the deaths which had already taken place". Lentin reports that the next day was Republic Day. So dutifully the two doctors went for the flag hoisting. "Neither the Dean nor the Superintendent did anything to identify the drugs or withdraw them"

Their first act was belated routine circular on January 27 without any effort to follow up. The Dean explained to the Commission that he considered the death of five patients from drug reaction as statistically normal. He added "over five patients would be a serious problem" But then claimed later that "if a drug is contaminated, spurious, adulterated or otherwise substandard, he would consider even two cases of reaction to be a serious problem". He tried to explain away his role as merely clerical. Lentin adds that the doctor knew the medical store which was supplying drugs was open, yet did nothing (p 37).

It was not only the doctors who were negligent. Lentin discovers that the pharmacist too was guilty. Jamadagni, the pharmacist, was among the first to know about the gravity of the situation but did nothing. "It was Saturday the 22nd and yet on that date he shut shop as usual at 12 noon and went home. Even on the 27th when he got a notification that he should notify the wards and stop the use of 3 suspect drugs, Jamadagni did nothing'. Lentin remarks that on the morning of the 27th, he had issued "25 fresh bottles of glycerine" and yet even after receiving the circular, he did not recall the bottles. There is an even more bizarre fact. The haphazard and bizarre way in which the pharmacist maintained his records left an even more tantalising question unanswered. "To this day there is no complete account of the withdrawal of Batch 27 which can be accounted for". The commission discovers something even more startling. Reviewing the procedures for ordering drugs, Lentin realises that pharmacist had violated the rules of quota, and ordered excess bottles from the company Alpana Pharma. Lentin comments "Alpana Pharma was given the order far in excess of the requisite 11 per cent. If this had not been done, perhaps Batch 27 would not have been ordered by J J and lives in the hospital might have been saved, albeit lost elsewhere...".

The Commission then asks: "Why this warmheartedness on the part of Jamadagni toward Alpana Pharma? Was it love? No. Was it friendship? No. Was it ignorance? No. Was it a mistake? No. Was it stupidity? No. Was it the old adage – you tickle me, Toby, I tickle thee? Perhaps the question best answers itself" (p 76).

The Lentin Report smacks of literary allusions. In a strange way it is a very British document. In fact one sees an inversion. When one reads the great colonial reports, one sees an attempt to grasp the tropical, the oriental, the native, the exotic. With independence came a new genre of reports written by Indians and many of them were immaculately British in style. In fact, *The Lentin Report* could have been only written by someone raised on Dickens and Shakespeare. It is these literary giants who provide the archetypes, the metaphors with which Lentin approaches corruption.

It is in unravelling the procedures for the ordering and purchase of drugs that *The Lentin Report* begins a pilgrims progress, a bureaucratic equivalent of tinker, tailor, soldier, spy. Lentin traces a trajectory through doctors, compounder, nurse, businessman, clerk, politician, all the accoutrements of a city. The text has all the visuality of old daguerreotypes.

We encounter first the clerk. The clerk is a bizarre magical figure. It is in the world of rules that every clerk becomes a magician, determining what is real or not. The clerk is a figure that subverts the Weberian bureaucracy Max Weber wrote about the bureaucratic organisation as one most powerful of human creations In his ideal typical portrait he talked out its division of functions, its impersonality, the clarity, the hierarchy, the importance of written communication. The clerk subverts it all turning a transparent organisation into a magical and occult one. Weber would have wept at the Borgesian turn the clerk gave the bureaucracy.

In reviewing the procedures for purchase Lentin unravels this surreal world. The Commission discovers that ten meetings were held about tenders between July 11 and 25, 1984. The members present included representatives of the FDA, the directorate of industries and the professors of pharmacology at J J Hospital. The Commission notes:

> Decisions taken by the Committee members were not contemporaneously reduced to writing. That was done later and never signed on the same day.. No minutes of the meetings were kept, hence there is no written record to show what actually transpired . The comparative statements do not bear the dates of the decisions taken or even the dates the decisions were signed . . Meetings were on from 11 a m to 5 or 6 p m daily with the conventional breaks 50 items were discussed at each meeting, making an average of 8-10 minutes per item By the time the last item came, everyone was not unnaturally in a hurry to depart The procedure was that the items were called out serially, but only one comparative statement was placed before all the members; no copies made available for their benefit The comparative statement remained with the Director of Industries and was not circulated amongst the Committee Members, with the result that they had no means or manner of knowing or recalling beforehand the names of the tenderers or the viability or otherwise of the drug concerned. However files of the tenderers were kept ready for perusal of the members, in case they desired to see them. From the record it does not appear that any member expressed a desire in that direction.. . Everything hinged on a mere visual observation of the sample, the container and the label Decisions taken were not written down there and then – that was done the following day or a few days later. These decisions were thereafter sent in bulk to the members for their signatures. It is difficult to envisage how after a space of time, all the members

would remember all the decisions taken. The above aspects emerging from the evidence of these witness indicate the slap-happy and totally unsatisfactory procedure adopted at the Committee Meetings where medicines and drugs including life saving drugs were selected for being administered in government-run hospitals (p 80).

In tracing how Alpana Pharma received the contract despite giving a conditional tender, the Commission discovers the macabre role of the clerk Torvi, an industries department officer. Alpana Pharma was listed at serial no 5 for discussion. Enter Torvi and presto four contenders disappear from the list and become non-persons. All Torvi is required to do is mark NTS in the column next to the contenders. "In the remarks column, a brief noting was made if a tender was rejected, that noting whatever be the reason for rejection, was a mere NTS -- an abbreviations of not to specifications (which might mean anything) – but the actual reasons for the rejection were never stated". NTS was a magical wand in Torvi's hands (p 81).

Alpana Pharma was not even eligible to apply for the contract because it was only a repacking firm and neither an authorised distributor, agent or manufacturing company. It did not even have a mandatory research laboratory for testing drugs. The Commission observes,

Circumstantial evidence does indicate that Alpana Pharma had, as stated earlier, some protective and interested guardian angel in the Industries Department to look after its well-being. There is no reason why obvious deficiencies should have been allowed to pass muster or why they should have been allowed to be 'cured' at a later stage, to wit, the lack of income-tax clearance certificate. There is on record a certificate dated 1st August 1984 from the General Manager, District Industries Centre, Nanded. It is a strange certificate. It says that Alpana Pharma 'has gone into initial repacking of pharmaceutical products w e f 26th April 1984'. Apart from the fact that Alpana Pharma had not done anything of the kind, it is a matter of bewilderment how this certificate given in August 1984 should have found a place on the record of the Committee during its meeting in July 1984 when Alpana Pharma had already been selected for the contract. No explanation has been forthcoming for this amazing who-done-it... No doubt Alpana Pharma was a favoured 'customer' in the Industries Department. Why should this be so unless there was a strong motivation for someone in the Industries Department? Corruption is manifest... To that end the strongest motivation was on the part of the Industries Officer Torvi as is clear from his evidence Torvi scrutinised the tenders. Thereafter Torvi prepared the scrutiny sheet. The documents remained with Torvi. It was he who belatedly accepted in June 1984 Alpana Pharma's income-tax clearance and SSI registration certificates which Alpana Pharma was bound to file with the tender on 27 April 1984. No doubt, this was done by Torvi in order to make sure that Alpana Pharma's tender should not be invalidated at the threshold for the lack of these documents. Torvi also knew that a conditional tender had to be rejected. Even so he allowed Alpana Pharma's conditional tender to pass muster. In the Comparative Statement prepared by him he did say that the tender was conditional. That by itself does not indicate honesty of purpose on Torvi's part. He did so obviously to safeguard his own position, as a conditional tender was bound to come to light sooner or later (p 84).

The Commission asks "Pray, why would Torvi go out of his way to do all this. It is here that the entry for Rs 500 shown as "tender expenses CSPO" in Alpana Pharma's account book assumes significance. On the showing of Alpana Pharma's partner O P Ladda, this entry though made under date May 19, 1984 should have been made in April. That was the month when Alpana Pharma filed the tender. The "tender expenses CSPO" appears to be an euphemistic way of denoting a bribe. In April who could have been bribed? Some one who would not scuttle Alpana Pharma's tender at the very outset for its obvious and patent defect. Who could that someone be? Who other than the one person in whose hands lay the power to invalidate that tender? That person was officer Torvi."

The Commission then proceeds to unravel the parallel lives of Dr Kulkarni, professor of pharmacology at J J Hospital.

From 1972 until February 13, 1986 Dr Kulkarni was attached to the J J Hospital as Professor of Pharmacology except for a period of one year in 1976-77. From 1972 he was a member of the Drugs Selection Committee except in 1976-77 when he held an identical post at the B J Medical College, Poona. He was a full time Government employee. His last awn monthly salary was Rs 4800 inclusive of non-practice allowance of Rs 600. According to him, this was his only source of income coupled with remuneration for examining papers of Ph D, post graduate and other students... While he was Professor of Pharmacology, he started two units for doing research work in the J J Hospital, namely Unit I (Clinical Pharmacological Unit) in 1969 and Unit II (Dr R D Kulkarni Research Unit) in 1972-73. Dr Kulkarni was the Director of both units. The patron of Unit I was Hoechst Pharmaceuticals with an annual grant of Rs 1,00,000 to Rs 1,50,000 to cover expenses. The patron of Unit II was Himalaya Drug Company with an annual grant of Rs 1,00,000 to cover expenses. The expenditure of these units was budgeted. Unit I had an account with the Syndicate Bank in the name of 'Clinical Pharmacological Unit, Grant Medical'. This bank account was operated jointly by Dr Pinto Pereira of Hoechst Pharmaceuticals and Dr R D Kulkarni. Unit II had a savings account with the Maharashtra State Co-operative Bank, Opp J J Hospital in the name of 'R D Kulkarni Research Account' Indisputably these units were controlled by Dr Kulkarni as is manifest from the fact that after he left the J J Hospital in February 1986, both Hoechst and Himalaya terminated their agreements. For the purpose of the present inquiry, we are concerned with Dr Kulkarni's manipulations in the savings account of Unit II which was operated by him alone. As will appear presently, from this account large amounts aggregating to about Rs 2,00,000 were received every year and large withdrawals in cash or by cheque were made including certain withdrawals which on Dr Kulkarni's own admission were his personal with awals, having nothing to do with Unit II. No account books were maintained and no income-tax returns were filed.... In 1982, bio-availability data study work was done in Unit II by Dr Kulkarni for Artichem Laboratories, Pune. Since then he knows Artichem's partner Ramanlal Karwa. On 30 May, 1985 Artichem issued a cheque for Rs 18,000 in favour of R D Kulkarni Research Account. This amount was deposited by Dr Kulkarni in the savings account with the Maharashtra State Co-operative Bank. This amount is said to have been legal payment for certain bio-availability data study work done by Dr Kulkarni for Artichem in 1984. However as will be shown presently, it was nothing but a consideration given to Dr Kulkarni by Ramanlal Karwa to ensure the passing of Alpana Pharma's tender by the Drugs Selection Committee of which Dr Kulkarni was a member. That is how Unit II's savings account in the name of 'R D Kulkarni Research Account' solely operated and controlled by Dr Kulkarni comes into the picture... Dr Kulkarni pontificated that this savings account in the Maharashtra State Co-operative Bank was not his personal account and no personal expenses were met by him from that account. This will presently be shown to be utterly false. He knows a person by the name of Karwa, but initially sought to distance himself from him by professing not to know his first name. He professed not to have remembered Artichem's name that morning when he gave his evidence

or even that it is situated at Pune, even though specifically asked, but suddenly remembered it when Artichem was mentioned in connection with Karwa. Thus after such and similar calculated and pathetic attempts to distance himself from Ramanlal Karwa and Artichem, Dr Kulkarni ultimately admitted that Ramanlal Karwa is the same person connected with Artichem Laboratories for whom Dr Kulkarni had done bio-availability data study work in 1982 and who had met him in 1984 for the same purpose and that it was the same Ramanlal Karwa and the same Artichem from whom in the past he had received payments in the vicinity of Rs 30,000. Initially Dr Kulkarni was categorical that receipts were always given to parties making payments for the bio-availability data work done by Units I and II, that such payments would be recorded in the account books maintained by the Unit concerned and that a regular account projectwise was maintained He soon had to swallow these sanctimonious sentiments when he had to admit to the contrary, namely that he did not prepare yearly account so as to tally it with the bank account, nor was any account maintained in the form of a ledger, cash book or journal and that the accounts allegedly maintained have not been shown by him to anyone...Dr Kulkarni's statement that the savings account in the Maharashtra State Co-operative Bank was never treated by him as his personal account was demonstrably untrue from his own admissions that a number of withdrawals had been made by him for his personal expenses, to name a few, payments to the Diners Club, the CCI, to George Motors for repairs to his personal motor-car, Rs 15,000 to a builder towards the construction of Dr Kulkarni's bungalow at Pune and electricity bills.... None of these amounts and many more, did R D Kulkarni ever think of putting back into this account. And there was reasons for his not doing so; because he treated this account as his secret undisclosed personal account, which indeed it was (Amalgamated from pp 91-93).

The final question that one needs to ask is what did the other members of the Commission feel? Assistant Commissioner Rayakar admitted he had not read the pages fully or scrutinised them with care. It was then discovered that Rayakar was a student doing his M Pharm in the Pharmacology department where Kulkarni was a professor. Given this he behaved like a mere figurehead at the meetings allowing Dr Kulkarni 'to lead him by the nose'.

Dr Mistry, another member of the Committee admitted to being casual. He was virtually a rubber stamp. In fact what is interesting is that Mistry could hardly remember the details of the meeting. Nothing like a touch of amnesia to erase guilt.

IV

In the novel, the hospital like the ship or the castle is a self enclosed space within which the detective can detect a crime. Hermetically shut off by storm, snow, sea or moat, these spaces resemble the space of the controlled experiment. The brilliance of Lentin lies in opening out this space. The frame of the report changes. We are not tracking one murderer in a self-enclosed locale, like murder in a mansion, a ship or a tourist hostel. The site opens as we leave the hospital and trace the moral career of the drug across the city.

Justice Lentin takes four institutions each a specific and bounded domain, each a web of silence and amnesia, and connects them. The four structures are the hospital, the industry, the Food and Drugs Administration (FDA) and the politician.

Reading these pages one is reminded of John Donne's oft quoted lines "No man is an island. Ask not for whom the bell tolls, it tolls for thee." And in that lies the fascination of Lentin. He shows how each individual act of corruption, insulated in itself creates a chain reaction that leads to 14 deaths. Yet what is interesting is that no one owns up. There is only amnesia, erasure or evasion. Lentin forces everyone to remember. Even if there is no guilt, no atonement, he connects them all into a great chain of murder – indirect, random and almost desperately meaningless. The victims are incidental to the murder. It was random. It could have been anyone, *anyman, everyman*.

Lentin discovers a second fact, that the moral universe around these structures does not exist. There is the event and there is a public outrage but eventually it has all the excitement of a monsoon shower. In fact, it is Lentin's narrative that creates the moral world. *Lentin's Report* by linking them, asking them, talking to them, implicates all of them.

Lentin wants you to experience the events, live through each decision not in terms of motivations or intentions but consequences. Each little cameo is petty, even sterile. What bare drama there is lies in the erasing of a diary, lying about some petty event, or the simulation of amnesia or misunderstanding. Corruption to be understood needs a sense of connection. There are two ways of conceptualising this, two notions of connection, of hierarchy both captured in folklore. You can read it forwards like 'The House That Jack Built'. 'This is the rat that ate the malt that lived in the house that Jack built. This is the cat that ate the rat that ate the malt that lived in the house that Jack built'. Or more puritanically the old folk poem, 'For want of a nail a shoe was lost. For want of a shoe a horse was lost'. Children have this sense of the oceanic circles. Remember how as children we drew the name, the house, the street, the city, the region, the world with a here I stand celebration. Understanding corruption requires that sense of connection and consequence again. It is with such a sense that Lentin sets out to connect all the four organisations.

V

Lentin's chapter on the industry begins with a list of *dramatis personae* and as we move across the list of manufacturers, packers, middlemen, we realise that this is not the drug industry in the normal sense. These are not research multinationals with scientific testing laboratories whose antiseptic pallor may hide enormous crimes. Nor are these the local 'dawakhanas' where housewives prepared decoctions with care and skill. This so-called industry could be a set of props, a shadow play where one man claimed to be a packer, another a chemist. It is a bit like the game of passing the parcel, only the parcel happens to be a lethal adulterated drug. The basic sequence was as in the figure.
